tcanta Hedge HedgePlants can be grown as a screen. Although they die down in the winter they quickly attain their full height each season[200].

nrakta E. Asia - Japan. ksacta Moist soils in meadows[200], of lowland Japan[58].

propta Seed - surface sow in spring in a greenhouse and keep moist. Germination should take place within a couple (clay) soils. Suitable pH: mildly acid, neutral and basic is taken internally, and is also applied externally to the fore-(mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: LeavesEdible Uses: Young sprouts and leaves - cooked[105, 177].

dwatta Analgesic Antipruritic Antirheumatic Hypotensive Parasiticide SedativeThe leaves are mildly analgesic, antipruritic, hypotensive and sedative[176, 218, 254]. They are used externally in the treatment of dermatitis and internally for the treatment of hypertension, rheumatoid arthritis, joint pain, numbness and paralysis[176, 218, 254]. When used in a clinical trial of 171 people, the blood pressure of 81% of the people dropped significantly - this effect was reversed when the treatment was stopped[254]. The plant is normally used in conjunction with Bidens bipinnata[218]. When used with the herb Siegesbeckia pubescens it is antiinflammatory[254]. The roots and leaves are antirheumatic and hypotensive[147]. A decoction is used in the treatment of rheumatoid arthritis and hypertension[147]. The pounded seed is used to kill lice[218].

nrakta E. Asia - China, Japan, Korea. ksacta Thickets on mountain slopes, throughout most of China except Nei Mongol, below elevations of 2400 metres[266].

propta Seed - best sown as soon as possible in a greenhouse. Germination can be erratic but usually takes place within 20 - 60 days at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Root cuttings, 6 - 8cm long, December in a greenhouse. High percentage [78]. Division of suckers in the dormant season. Very easy, they can be planted out direct into their permanent positions if required.

nwatta Landscape Uses: Espalier, Standard, Specimen, Succeeds in a sunny position in ordinary garden soil but prefers a fertile humus-rich well-drained loam[164, 200]. The soil must not be allowed to dry out in the growing season[1]. Requires a position sheltered from cold drying winds[1, 200]. Plants are generally hardy to about -15°c[184, 200], they succeed outdoors at Kew though the branches are pithy and are apt to die back in winter[11]. The sub-species C. trichotomum fargesii. (Dode.)Rehder. is somewhat hardier, tolerating temperatures down to about -20°c[184]. Plants produce the occasional sucker[182]. The leaves have a heavy unpleasant odour when crushed[11, 1821. Flowers are produced on the current seasons growth and are sweetly scented[200]. Special Features: Not North American native, Attractive flowers or blooms.

#### 7.2.366 Clematis buchananiana

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Clematis buchananiana is a deciduous Climber growing to 6 m (19ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no reports of toxicity have been seen for this species, some if not all members of this genus are mildly poisonous. The toxic principle is dissipated by heat or by drying[65].

kcakta Edible Parts: LeavesEdible Uses: DrinkTender young leaves - coked as a vegetable[272]. Some caution is advised, see the notes above on toxicity[K]. The plant is used in Nepal to make marcha, a fermented cake from which an alcoholic beverage is distilled[272].

dwatta Analgesic Odontalgic Poultice Stomachic VulneraryA paste of the roots is used as a poultice to treat swellings caused by inflammation[272]. The juice of the root is used in the treatment of peptic ulcers[272]. The juice is also inhaled to get rid of coughs and colds[272]. A paste of the stem or root bark is kept pressed against the teeth for about 15 minutes to relieve toothache[272]. The juice of the plant is applied externally to cuts and wounds[272]. It is also taken internally in the treatment of indigestion[272]. The leaf juice head, in the treatment of coughs and colds[272]. It is also warmed and placed inside the nose when treating sinusitis[272]

nrakta E. Asia - Himalayas from Kashmir to Tibet, Burma and western China, ksacta Warm broad-leaved to cool mixed forests, forest margins, generally growing on small trees and bushes, occasionally over rocks along the sides of streams at elevations of 460 - 3650 metres[273].

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°c[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade and its shoots growing up to the light[164]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Succeeds in acid as well as alkaline soils[200]. A very variable species, it varies considerably in hardiness according to the region from which the plant was first obtained - those obtained from the higher limits of its range being more coldtolerant[273]. It grows best in the milder or sub-tropical areas where its late-flowering habit can be fully appreciated. In colder areas the flowers are often badly damaged by frost[273]. A vigorous plant, capable of putting out new shoots up to 4 metres long in a season[273]. A twining plant, the leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. Plants flower on the current seasons growth. They usually require no pruning, especially if left to clamber into large shrubs and trees. Weak or dead stems can be removed in the winter and, where pruning may be required to reduce the size of the plant, shoots can be cut back by up to two thirds in the winter[273]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

#### 7.2.367 Salix chaenomeloides

Japanese Pussy Willow

6 tlin 8 cyuc 1 kcak 3 tcan 2 dwat 6 m hkuc

htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhien hionli

drutta Salix chaenomeloides is a deciduous Tree growing to 6 m (19ft 8in) at a fast rate. It is not frost tender. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - raw or cooked. They are not very palatable[172].

tcanta Landscape Uses:Border, Massing, Specimen, Winter interest. Special Features: Not North American native. Attractive flowers or blooms. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in

for their ornamental value. This species usually self-sows in the garden if growing in a good position[1]. A fast-growing plant[188], it makes a good edging to a plant bed[245]. The forms of this species with white flowers have the refreshing scent of new-mown hay - flowers of other colours having little or no scent[245]. A good bee and butterfly plant[17, 30]. Special Features: Attractive foliage, Naturalizing, Fragrant flowers

### **7.2.362** Ilex integra

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ilex integra is an evergreen Tree growing to 6 m (19ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in guan-

kcakta Edible Parts: LeavesEdible Uses: Young leaves cooked. A famine food, it is only used when all else fails 1771.

nrakta E. Asia - E. China, Japan, Korea. ksacta Thickets and woods in hills and low mountains, often near the sea, in C. and S. Japan[58, 184].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged[200]. Somewhat tender for its first two or three years from seed[11, 182], this species is hardy to about -10°c[184] when it gets older. Resents root disturbance, especially as the plant grows older[1, 11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.363 Pachyphragma macrophylla

6 tlin 9 cvuc 1 kcak 0 tcan 0 dwat m hkuc pcimhmim cyutli hgatkyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pachyphragma macrophylla is an evergreen Perennial growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from March to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: It would be worthwhile trying out the leaves of this species for edibility. They are almost certainly not poisonous[K].

tcanta An excellent weed-smothering ground cover plant for shady areas[200]. The plants have persistent basal rosettes but only achieve full ground cover from mid or late spring until early winter each year[200].

nrakta W. Asia - N.E. Turkey to W. Caucasus. Naturalized in Britain. ksacta Wet beech forests to elevations of 1900 metres in Turkey[187]

propta Seed - sow autumn in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in late spring[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a leafy soil and a damp shady position[187, 200]. Another report says that it succeeds in dry soils and, once established, tolerates drought[190]. Succeeds in heavy clays[200]. Very shade tolerant[200]. Succeeds in full sun or partial shade[188]. Possibly hardy to about -15°c[187, 200]. Plants have persistent basal

### 7.2.364 Dracocephalum moldavica

Moldavian Balm, Moldavian dragonhead 6 tlin 9 cvuc 1 kcak 0 tcan 1 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Dracocephalum moldavica is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaThe lemonscented leaves are used to make a tea[183]. Young shoots[183]. No further details are given.

tcanta EssentialThe plant contains an essential oil, this is a possible source of citral[240].

dwatta Astringent Carminative Tonic VulneraryThe seeds are astringent, carminative and tonic[240]. They are used as a demulcent in the treatment of fevers[240]. The plant is astringent, tonic and vulnerary[240].

nrakta E. Europe to E. Asia. ksacta Dry hills, stony riverbanks and valleys at elevations from 200 - 2,700 metres in western China.

propta Seed - sow early spring in situ. Pinch back the shoot tips in May in order to encourage bushy growth[200].

nwatta Succeeds in a sunny position in a fertile welldrained soil[200]. The plant is sometimes cultivated for its essential oil[266]. The plant is very fragrant[200], with both the leaves and the flowers emitting a most refreshing scent of lemons[245]. The flowers remain fragrant and fresh for several weeks[245]. It is a useful plant for filling gaps in the summer border[200].

### 7.2.365 Clerodendrum trichotomum

Chou Wu Tong, Harlequin glorybower, Ferruginous clerodendrum, Harleguin Glory Bower

6 tlin 11 cyuc 1 kcak 0 tcan 3 dwat 6 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Clerodendrum trichotomum is a deciduous Tree growing to 6 m (19ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy

of weeks. When they are large enough to handle, prick the 7.2.272 Polygonum molle seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or early autumn[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Container, Erosion control, Seashore, Specimen, Winter interest. Prefers a deep fertile loamy soil that does not dry out in summer[200] but it also succeeds in any ordinary soil that is not too dry[1, 162], in sun or light shade[200]. Plants can be grown as a focal point in lawns, they also succeed in guite coarse grass[233]. The young growth in spring can be damaged by late frosts. This species is closely related to M. sacchariflorus[233]. The leaves have saw-toothed edges that can cut the unwary gardener, it is best to wear gloves when working with the plant[200]. Plants seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Not North American native. Suitable for cut flowers. Suitable for dried flowers

### 7.2.271 Mahonia gracilipes

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 1.5 m hkuc pcimhmim cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mahonia gracilipes is an evergreen Shrub growing to 1.5 m (5ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. We have no specific information on the fruit of this species, but all members of the genus have more or less edible fruit.

dwatta Antibacterial Antitumor Bitter DysenteryBerberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta E. Asia - Western China western Sichuan province. ksacta Not known

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in a cold frame for at least their first winter. Plant them out in late spring or early summer. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta An easily grown shrub, it thrives in any good garden soil[11] including heavy clays. Prefers a semi-shaded woodland position in a damp, slightly acid to neutral humusrich soil[200]. Plants can tolerate temperatures down to about -10°c[200]. Plants are very tolerant of pruning and can be cut right back into old wood if they have outgrown their welcome[182]. Plants produce suckers and form gradually spreading clumps[200]. Hybridizes freely with other members of this genus.

6 tlin 9 cvuc 2 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Polygonum molle is a PERENNIAL growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention has been made for this species, there have been reports that some members of this genus can cause photosensitivity in susceptible people. Many species also contain oxalic acid (the distinctive lemony flavour of sorrel) - whilst not toxic this substance can bind up other minerals making them unavailable to the body and leading to mineral deficiency. Having said that, a number of common foods such as sorrel and rhubarb contain oxalic acid and the leaves of most members of this genus are nutritious and beneficial to eat in moderate quantities. Cooking the leaves will reduce their content of oxalic acid. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Leaves SeedEdible Uses: Young shoots - raw or cooked as a vegetable[146, 177, 272]. Pleasantly acid, they are used like rhubarb[105]. Seed - raw or cooked. It is rather small and fiddly to utilize

tcanta Soil stabilizationPlants are very fast growing and are used to reclothe and stabilize land slips[146]. They are best spaced about 1.2 metres apart each way[208].

dwatta AstringentThe whole plant is astringent[240].

nrakta E. Asia - Himalayas from Uttar Pradesh to S.W. China. ksacta Forest, scrub and damp ground, often gregarious, 900 - 4250 metres[51, 187], Slopes, forests, grassy places and thickets in valleys at elevations of 1300 - 3500

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. A very fast growing plant[146]. Plants seem to be immune to the predations of rabbits[233].

### 7.2.273 Brassica rapa dichotoma

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.9 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Brassica rapa dichotoma is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Leaves - raw or cooked. A bit on the coarse side, though the young leaves can be added in moderation to salads whilst older leaves make an acceptable vegetable[K]. An edible oil is obtained from the seeds.

nrakta A cultivated form of B, rapa, ksacta Not known

propta Seed - sow in situ in the spring.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Prefers a light sandy soil and dislikes a heavy soil[37]. Prefers cool moist growing conditions[16]. Succeeds in any reasonable soil. Tolerates a pH in the range 4.3 to 8.3. Indian rape is cultivated mainly in India and Nepal for its oil-rich seeds.

### 7.2.274 Rosa laevigata

Cherokee Rose

6 tlin 9 cyuc 2 kcak 0 tcan 3 dwat 6 m hkuc

htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Rosa laevigata is an evergreen Shrub growing to 6 m (19ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista There is a layer of hairs around the seeds just beneath the flesh of the fruit. These hairs can cause irritation to the mouth and digestive tract if ingested.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit raw or cooked[177]. The pear-shaped fruit is up to 4cm long[200], but there is only a thin layer of flesh surrounding the many seeds[K]. Sugar can be extracted from the fruit, it is also used to ferment rose wine[266]. Some care has to be taken when eating this fruit, see the notes above on known hazards. The seed is a good source of vitamin E, it can be ground and mixed with flour or added to other foods as a supplement[102, 183]. Be sure to remove the seed hairs[102].

tcanta TanninThe root bark contains tannin[266]..

dwatta Antibacterial Anticholesterolemic Astringent Cancer Carminative Depurative Diuretic Dysentery Emmenagogue Infertility Kidney Stomachic Urinary VulneraryThe leaves are a famous vulnerary[218]. The fruits, root and leaves are emmenagogue and depurative[147]. Their use stabilizes the kidneys [147]. A decoction is used in the treatment of chronic dysentery, urinary tract infections, wet dreams, prolapse of the uterus, menstrual irregularities and traumatic injuries[147]. The root bark is astringent and used in the treatment of diarrhoea and menorrhagia[218]. The dried fruits are antibacterial, anticholesterolemic, astringent, carminative, diuretic and stomachic[176, 178, 218, 238]. They are used internally in the treatment of urinary dysfunction, infertility, seminal emissions, urorrhoea, leucorrhoea and chronic diarrhoea[238]. The root is used in the treatment of uteral prolapse[218]. The flowers are used in the treatment of dysentery and to restore hair cover[218]. The fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A. C and E. flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

nrakta E. Asia - Southern China from Sichuan and Hubei to Taiwan. ksacta Rocky places at low altitudes[109]. In open fields, farmland, or in scrub at elevations of 200 - 1600 metres[266]

propta Seed. Rose seed often takes two years to germinate. This is because it may need a warm spell of weather after a cold spell in order to mature the embryo and reduce the seedcoat[80]. One possible way to reduce this time is to scarify the seed and then place it for 2 - 3 weeks in damp peat at a temperature of 27 - 32°c (by which time the seed should have imbibed). It is then kept at 3°c for the next 4 months by which time it should be starting to germinate[80]. Alternatively, it is possible that seed harvested 'green' (when it is fully developed but before it has dried on the plant) and sown immediately will germinate in the late winter. This method has not as yet(1988) been fully tested[80]. Seed sown as soon as it is ripe in a cold frame sometimes germinates in spring though it may take 18 months. Stored seed can be sown as early in the year as possible and stratified for 6 weeks at 5°c[200]. It may take 2 years to germinate[200]. Prick out the seedlings into individual pots when they are large enough to handle.

Plant out in the summer if the plants are more than 25cm tall. otherwise grow on in a cold frame for the winter and plant out in late spring. Cuttings of half-ripe wood with a heel, July in a shaded frame. Overwinter the plants in the frame and plant out in late spring[78]. High percentage[78]. Cuttings of mature wood of the current seasons growth. Select pencil thick shoots in early autumn that are about 20 - 25cm long and plant them in a sheltered position outdoors or in a cold frame[78, 200]. The cuttings can take 12 months to establish but a high percentage of them normally succeed[78]. Division of suckers in the dormant season. Plant them out direct into their permanent positions. Lavering, Takes 12 months[11].

nwatta Succeeds in most soils[11], preferring a circumneutral soil and a sunny position[200]. Grows well in heavy clay soils. Dislikes water-logged soils[200]. A very ornamental plant[1], but it is not very hardy in Britain and only succeeds outside in the warmer parts of the country[11]. It can be cut back to the ground even in southern England in cold winters, though it will usually resprout from the base[260]. It is the state flower of Georgia[219] and is also the parent of several modern garden cultivars[219]. The flowers have a clove-like fragrance[245]. If any pruning is necessary then this should be carried out immediately after the plant has finished flowering[219]. Grows well with alliums, parsley, mignonette and lupins[18, 20]. Garlic planted nearby can help protect the plant from disease and insect predation[18, 201. Grows badly with boxwood[18]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.275 Mimulus luteus

Monkey Musk, Yellow monkey-flower 6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Mimulus luteus is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[105, 257]. Eaten as greens[257].

nrakta S. America - Chile. Naturalized in Britain. ksacta Wet places[60]. Locally naturalized by streams in Scotland.

propta Seed - sow spring in a greenhouse and only lightly cover the seed[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can also be sown in situ in late spring after the last expected frosts[200]. Division in spring[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings of softwood, 5cm long in spring or summer[200].

nwatta Prefers rather moist places such as damp borders, margins of streams and boggy spots[1]. Grows well in heavy clay soils. Thrives in full sun so long as the soil does not dry out[200]. Hardy to about -20°c[187]. There is some confusion over the naming of this plant, the entry on edibility may refer to M. guttatus, which is closely related to this species[161, 200]. Hybridizes with M. guttatus[187].

### 7.2.276 Juniperus rigida

Temple Juniper, Needle Juniper 6 tlin 7 cyuc 2 kcak 0 tcan 1 dwat 8 m hkuc htut cyutli hgatkyuctcup hwicli hrasilutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus rigida is an evergreen Tree growing to 8 m (26ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be the treatment of colds, coughs, neuralgia, rheumatism and 7.2.360 Salvia moorcroftiana water on the knee[218].

nrakta E. Asia - Himalayas. ksacta Thickets[11]. Mountainous areas in Vietnam, occasionally on the edges of forests[283].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. It can be slow to germinate. Stored seed requires 6 months warm followed by 3 months cold stratification[113] and can be very slow to germinate[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least the first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[113, 200]. Cuttings of ripe wood of the current season's growth, 15 - 30cm long in a cold frame[238]. Root cuttings in late winter[200]. Division of suckers in the dormant season[200]

nwatta Prefers a light warm open loamy humus-rich soil and a position sheltered from north and east winds.[1, 11, 200] Prefers a well-drained soil and full sun[200]. Tolerates urban pollution and poor soils[200]. All parts of the plant are particularly fragrant[283]. Plants are hardy to between -10 and -15°c if they are sheltered from cold winds[200].

### 7.2.359 Cornus monbeigii

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasilutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cornus monbeigii is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The following notes are for C. macrophylla, they guite probably also apply to this closely related species[K]. Fruit - raw or cooked[2, 105, 146, 158, 200, 218]. The fruit is about 6mm in diame-

tcanta WoodThe following notes are for C. macrophylla, they quite probably also apply to this closely related species[K]. Wood - hard, close grained, warps badly[158]. It makes a good charcoal[146, 158].

dwatta Anodyne Astringent Dysentery TonicThe following notes are for C. macrophylla, they quite probably also apply to this closely related species[K]. Anodyne, astringent, tonic[178]. The wood is anodyne and a uterosedative[218]. The stem bark is used in the treatment of dysentery[218].

nrakta E. Asia - China. ksacta Dense and sparse forests, open hillsides at elevations of 1100 - 3200 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80. 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame[188]. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78], Lavering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[188], growing well in thin woodland[11]. This species is closely related to C. macrophylla[200]. Plants in this genus are notably resistant to honey fungus[200].

6 tlin 9 cvuc 1 kcak 0 tcan 1 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Salvia moorcroftiana is a PERENNIAL growing to 0.9 m (3ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: StemEdible Uses: Stems peeled[105, 177]. They are occasionally eaten[183].

dwatta Astringent Dysentery Emetic PoulticeThe roots are used in the treatment of colds and coughs[240]. The seed is emetic[240]. It is used in the treatment of dysentery, haemorrhoids, colic and, externally, boils[240]. A poultice of the leaves is used as a dressing for wounds and is also applied to itchy skin[240].

nrakta E. Asia - Himalayas from Pakistan to W. Nepal. ksacta Open slopes and wasteland, 1500 - 2700 metres[51].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. Closely related to S. argentea[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 7.2.361 Lobularia maritima

Sweet Alvssum

6 tlin 9 cvuc 1 kcak 0 tcan 1 dwat m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli dyatxre7t hjonli

drutta Lobularia maritima is a ANNUAL/PERENNIAL growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from April to October, in flower from June to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: CondimentThe young leaves, stems and flowers are sometimes used as a flavouring in salads and other dishes where pungency is required[183].

dwatta Antiscorbutic Astringent DiureticThe plant is commonly used in Spain as an antiscorbutic and diuretic[240]. It is also highly esteemed there as an astringent in the treatment of gonorrhoea[240].

nrakta Europe - Mediterranean. Naturalized in Britain. ksacta Dry sunny places in the Mediterranean [50]. Grows by the coast in Britain[17].

propta Seed - it can be sown in situ during mid to late spring and should germinate within 2 weeks[200]. Seedlings can be transplanted. In order to obtain an earlier display of the flowers, the seed can be sown in a greenhouse in late winter. When large enough to handle, the seedlings are pricked out into individual pots and are then planted out in late spring.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Rock garden, Seashore, Succeeds in an ordinary garden soil in a sunny position[200]. Succeeds in sandy soils[188]. Grows well on dry walls[1]. Tolerates maritime conditions[200]. Although a short-lived perennial, it soon loses its compact habit if grown for more than one year and so is usually grown as an annual plant in gardens[245]. A very ornamental plant, there are several named forms developed

Used in turner[46, 61]. An excellent charcoal is obtained from the stems[100].

dwatta Diuretic Emmenagogue MouthwashDiuretic, emmenagogue. Also used as a mouthwash[46, 61].

nrakta S.E. Europe to W. Asia. ksacta Evergreen thick-

ets and rocky slopes[45, 50], mainly on limestone[184]. propta Seed - best sown in a cold frame as soon as it is

ripe[200]. Sow stored seed as early in the year as possible. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Takes 15 months. High percentage[78]. Layering in autumn. Takes 12 months[78].

nwatta Thrives in any soil of moderate quality[11] Prefers a neutral to acid soil but tolerates some lime[200]. Succeeds in sun or semi-shade[200]. Tolerates maritime exposure[75, Kl. Plants are hardy to about -15°c[184]. A slow growing plant[182]. The flowers have a rich fruity perfume[245]. This species is cultivated for its edible olive-like fruit in southern Europe[2]. (This report is possibly a mistake[K].) Plants in this genus are notably resistant to honey

### 7.2.356 Lithocarpus glaber

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 7 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Lithocarpus glaber is an evergreen Tree growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed cooked[177]. The seed probably contains bitter-tasting tannins. These can be removed by soaking the seed in water for a few days, changing the soak water regularly. The process can be speeded up by grinding the seed into a powder prior to soaking[K].

nrakta E. Asia - E. China, Japan. ksacta Mixed mesophytic forests, frequent on sunny slopes; below 1500 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Taiwan, Zhejiang[266]

propta The seed is best sown as soon as it is ripe in the autumn in a cold frame[200]. It needs to be protected from mice, squirrels and other seed eaters. The seed has a short viability but can be stored for a few months if kept cool and slightly damp - the salad compartment of a fridge is a good storage place. Germination takes place in the winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots. If the plants are 15cm or more tall by the summer they can be planted out into their permanent positions. Give them a good weed-excluding mulch and some protection from the cold for their first couple of years outdoors. If growth is not sufficient then grow them on in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a deep fertile soil with medium drainage[200]. Plants are often confused with L. edulis[11]. The botanical name of this species is confusing - glaber means smooth but the young shoots of this species are hairy whilst the young shoots of L. edulis are smooth[11].

### 7.2.357 Pyracantha crenulata

Nepalese White Thorn, Nepalese firethorn 6 tlin 9 cvuc 1 kcak 0 tcan 1 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pyracantha crenulata is an evergreen Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to July. The species is hermaphrodite (has both male

and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even

kcakta Edible Parts: FruitEdible Uses: TeaThe leaves are made into a tea-like beverage[177, 183]. The fruits are rich in sugar[177]. The ripe fruit is eaten fresh[272]. The fruit is 6 - 8mm in diameter[200].

tcanta Hedge Hedge WoodThe plant makes an excellent hedge[272]. Wood - hard, very close and even grained. Used for walking sticks[51, 146, 272].

dwatta Astringent DysenteryThe powdered, dried fruit, combined with yoghurt, is used in the treatment of bloody dysentery[272].

nrakta E. Asia - Himalayas to China. ksacta Shrubberies, open slopes, cultivated areas, 1000 - 2400 metres from Kashmir to S.W. China[51]. Slopes, roadsides, streamsides, among shrubs, grassy places, valleys[266].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Remove all the fruit flesh since this can inhibit germination[200]. Stored seed requires 3 months cold stratification, sow it as early in the year as possible in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost mature wood, 5 -10cm with a heel, mid-August in a cold frame[78]. Pot up in October or the following spring[78].

nwatta Prefers a good well-drained, moisture retentive loamy soil[1, 200]. Succeeds in any soil that is warm and not very heavy[11]. Another report says that it grows well in heavy clay soils. Succeeds in sun or part shade, though it does not fruit so well in a shady position[200]. Tolerates atmospheric pollution and reasonable exposure, though it requires protection from cold winds[200]. Closely related to P. coccinea, but it is not as hardy as that species and is best grown on a south-facing wall in Britain[11]. Susceptible to scab and fireblight[11], especially when grown on acid sandy

### 7.2.358 Eleutherococcus trifoliatus

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hyishrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eleutherococcus trifoliatus is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Young leaves cooked[111, 177].

dwatta Antirheumatic Infertility Nervine TonicThe root bark and stem bark contain triterpenoid saponins and oleanolic acid[283] They are used in the treatment of rheumatism lumbago, ostealgia and impotence[283]. The bark is also considered to be a stimulant and tonic for the central nervous system and to improve the memory[283]. The bark is collected in the summer and autumn, wrapped to bring out the aroma and then thoroughly dried[283]. The plant is used in

found on any one plant so both male and female plants must be harvested as it comes into flower and either be distilled be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit OilEdible Uses: Condiment OilFruit - raw or cooked[183]. It can also be ground into a powder and used as a spice[105, 177, 183]. The cones are about 7 - 11mm in diameter, they take 2 years to mature[200].

tcanta Oil WoodAn oil is obtained from the fruit. It is mentioned as being diuretic[61], is this an essential oil? Wood. Used for construction, agricultural implements, fencing etc[61].

dwatta DiureticThe fruit is diuretic[61, 254].

nrakta E. Asia - Japan, Korea, Manchuria. ksacta Hills and mountains in C. and S. Japan[58]. Dry areas in mountains below 2200 metres in China[266].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Screen, Specimen. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[11] and succeeding on chalk[200]. Established plants are drought tolerant, succeeding in hot dry positions[200]. A very ornamental plant[1], it thrives in S. England[11]. Trees are very slow growing in Britain, normally averaging only 15cm a year increase in height[185]. Cultivated for its wood in Asia[61]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Fragrant foliage, Inconspicuous flowers or blooms.

### 7.2.277 Thymus capitatus

Headed Savory, Thymus 6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hrasilut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Thymus capitatus is an evergreen Shrub growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaThe plant is sometimes used as a condiment[183]. An essential oil from the plant is used for flavouring baked goods. condiments, beverages, ice creams etc. It is called 'Spanish oregano oil'[183, 238]. Leaves - raw in salads or added as a flavouring to cooked foods[2]. An aromatic tea is made from the leaves. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200].

tcanta Deodorant Disinfectant EssentialThe essential oil, known as 'Spanish oregano oil', obtained from the leaves is also used in perfumery and soaps, as a mouth wash, medicinally etc[46, 57, 89, 100, 200, 238].

dwatta Antiseptic Deodorant DisinfectantThe leaves. and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can for the oil or dried for later use[238]. The essential oil should not be used in aromatherapy because it is highly irritant to the mucous membranes[238].

nrakta Europe - Mediterranean. ksacta Dry, usually calcareous soils[45, 50].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[200]. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -10°c[200]. This species used to be cultivated as a culinary herb in the herb garden but it has now fallen into disuse[2]. The flowers are rich in nectar and are very attractive to honey bees[89, 148, 200, 238]. The growing plant is a beneficial companion for most plants[54]. The plant is powerfully pungent when handled[245]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

### 7.2.278 Yucca harrimaniae

Spanish Bayonet, New Mexico Spanish bayonet 6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.4 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Yucca harrimaniae is an evergreen Shrub growing to 0.4 m (1ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

pcista The roots contain saponins[222]. Whilst saponins are quite toxic to people, they are poorly absorbed by the body and so tend to pass straight through. They are also destroyed by prolonged heat, such as slow baking in an oven. Saponins are found in many common foods such as beans[K]. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: Flowers Fruit StemEdible Uses: Fruit - the immature fruit is cooked. A bitter taste, but most of the bitterness is in the skin[85]. Flowers - raw or cooked[85]. They are delicious raw, and can also be dried, crushed and used as a flavouring[164]. Flowering stem peeled, cooked and used like asparagus[164]. The whitish inner portion is eaten[85].

tcanta Broom Fibre SoapA fibre obtained from the leaves is used for making ropes, baskets and mats[82, 85 1691 The leaves themselves can be used as paint brushes[92], brooms or woven to make mats etc[85]. The roots are rich in saponins and can be used as a soap substitute[85].

nrakta Central N. America - Utah to Colorado, ksacta High plains grasslands to open coniferous woods[228].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept. at a temperature of 20°c. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their

first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78]. Division of suckers in late spring[111]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Requires a sunny position[11]. Plants are hardier when grown on poor sandy soils[200]. Established plants are very drought resistant, this species is also tolerant of cool damp weather[11]. Hardy to at least -30°c[164]. Closely allied to Y. glauca[1]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be guite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]

### 7.2.279 Pinus ayacahuite

Mexican White Pine

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 55 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dyat hjonli

drutta Pinus ayacahuite is an evergreen Tree growing to 55 m (180ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The wood, sawdust and resins from various species of pine can cause dermatitis in sensitive people[222].

kcakta Edible Parts: SeedEdible Uses: CondimentSeed-raw or cooked[183]. The seed is about 8mm long[200]. Rich in oil, the seed has a resinous flavour. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dve Herbicide Resin WoodA tan or green dve is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 641 In general trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc.

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment

for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

nrakta Southern N. America - Mexico. ksacta Lower pine forests in cool mountains in Mexico[181]. Sheltered valleys and mountain slopes at elevations of 2,400 - 3,300 metres[260].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are guite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Thrives in a light well-drained sandy or gravelly loam[1]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. Growth of older trees tends to be very slow but many younger trees are growing fairly quickly averaging more than 30cm a year[185]. This tree is unique in being the only tree from the tropics (it is found between latitudes 14 and 20°north) to succeed in central Scotland, latitude 57°north[200]. It tolerates temperatures down to about -15°c[260]. The cones open and shed their seed whilst still attached to the tree[226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Seed cones are up to 30cm long[200]. A tree at Kew in January 1995 was about 12 metres tall and had well over 50 large cones on it. Another mature tree of the same species growing nearby had only a very few cones[K]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.280 Quercus myrsinaefolia

6tlin 9 cyuc 2 kcak 0 t<br/>can 2 dwat m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flat<br/>priklwis hpa7tmwatli hjonli

drutta Quercus myrsinaefolia is an evergreen Tree growing to 15 m (49ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in June, and the seeds ripen in November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable formedium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[105, 177]. The seed is up to 25mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

#### 7.2.352 Ilex latifolia

Tarajo

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhien hionli

drutta llex latifolia is an evergreen Tree growing to 10 m (32ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

kcakta Edible Parts: Edible Uses: Coffee TeaThe leaves are used as a tea substitute[177, 183]. The roasted seed is used as a coffee substitute[177, 183].

nrakta E. Asia - China, Japan. ksacta Evergreen broadleaf forests, shrub forests and bamboo forests at elevations of 200 - 1500 metres[266].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged[200]. One report says that this species is hardy to about -15°c[184], another that it is hardy to about -5'c[260], whilst others say that it is not fully hardy in many parts of Britain and is best grown in the milder areas of the country[188, 200]. Plants succeed but they do not thrive outdoors at Kew, though they thrive just a few miles south of there[11]. Resents root disturbance, especially as the plant grows older[1, 11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.353 Lithocarpus edulis

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Lithocarpus edulis is an evergreen Tree growing to 9 m (29ft 6in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[123, 177, 183]. Not of a good taste[105]. The poor taste is probably due, at least in part, to the presence of tannins. These can be removed by soaking the seed in water for a few days, changing the soak water regularly. The process

can be speeded up by grinding the seed into a powder prior to soaking[K]. The seed is an acorn about 25mm long and 8mm wide[K].

nrakta E. Asia - C. and S. Japan. ksacta Not known

propta The seed is best sown as soon as it is ripe in the autumn in a cold frame[200]. It needs to be protected from mice, squirrels and other seed eaters. The seed has a short viability but can be stored for a few months if kept cool and slightly damp - the salad compartment of a fridge is a good storage place. Germination takes place in the winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots. If the plants are 15cm or more tall by the summer they can be planted out into their permanent positions. Give them a good weed-excluding mulch and some protection from the cold for their first couple of years outdoors. If growth is not sufficient then grow them on in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a deep fertile soil with medium drainage[200]. This species is only hardy in the southern half of England[11]. A tree growing in deep shade did not produce seed at Kew in the very hot summer of 1989[K]. A tree at Hilliers produced lots of seed in 1994, but they were not fertile and did not contain endosperm[K]. Plants are often confused with L. glabra[1].

### 7.2.354 Euptelea polyandra

Funtale

6 tlin 7 cyuc 1 kcak 0 tcan 0 dwat 8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euptelea polyandra is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. A famine food, used when all else fails[179].

nrakta E. Asia - Japan. ksacta Forests in mountains, C. and S. Japan[58].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering.

nwatta Landscape Uses:Border, Hedge, Screen, Standard, Specimen. Prefers an open moderately rich free soil[1] and full sun[200]. Grows well in an open situation in a woodland garden or shrub border[200]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

#### 7.2.355 Phillyrea latifolia

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 8 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phillyrea latifolia is an evergreen Tree growing to 8 m (26ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - olive-like[2]. It is possibly edible[105]. The fruit is an ovoid drupe about 6mm in diameter with a single seed[200].

tcanta Charcoal Hedge Hedge WoodBears pruning well and can be grown as a hedge, tolerating maritime exposure though it is fairly slow growing[11, 49, 75]. Any trimming is best carried out in the spring[188]. Wood - fine grained.

drutta Sorbus vestita is a deciduous Tree growing to must be viewed with some scepticism, the plant is unlikely 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista The seeds probably contain hydrogen cyanide. This is the ingredient that gives almonds their characteristic flavour. Unless the seed is very bitter it should be perfectly safe in reasonable quantities. In small quantities, hydrogen cvanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 146, 272]. The fruits are up to 2cm across[200]. nrakta E. Asia - Himalayas. ksacta Mixed forests at elevations of 2500 - 3700 metres from Uttar Pradesh to Sikkim[51, 272].

propta Seed - best sown as soon as it is ripe in a cold frame[78, 80]. If you have sufficient seed it can be sown in an outdoor seedbed[78, 80]. Stored seed germinates better if given 2 weeks warm then 14 - 16 weeks cold stratification[98], so sow it as early in the year as possible. Prick out the seedlings into individual pots when they are large enough to handle. Seedlings are very slow to put on top-growth for their first year or two[11], but they are busy building up a good root system. It is best to keep them in pots in a cold frame for their first winter and then plant them out into their permanent positions in late spring.

nwatta Succeeds in most reasonably good soils in an open sunny position[11]. Tolerates light shade[188], though it fruits better in a sunny position[K]. Plants are susceptible to fireblight[188]. A very ornamental tree[11], unfortunately the fruit is not freely borne in Britain[11]. Plants are apt to die back without any warning[11].

### 7.2.350 Euphorbia tetragona

6 tlin 9 cvuc 1 kcak 2 tcan 1 dwat 10 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Euphorbia tetragona is an evergreen Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista The sap contains a latex which is toxic on ingestion and highly irritant externally, causing photosensitive skin reactions and severe inflammation, especially on contact with eyes or open cuts. The toxicity can remain high even in dried plant material[200]. Prolonged and regular contact with the sap is inadvisable because of its carcinogenic nature[214].

kcakta Edible Parts: NectarEdible Uses: The flowers are rich in nectar and this is sometimes used in confectionery[183].

tcanta MiscellanyWildlife - The flowers are rich in nectar. Dynamic accumulator.

dwatta MiscellanyOne report says that this species also supplies the drug, though it fails to say what the drug is or its medicinal actions[4]

nrakta S. Africa - Cape Province ksacta Not known

propta Seed - sow spring in a shaded position in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a light well-drained moderately rich loam in an open position[200]. Succeeds in dry soils[1]. According to [200] this species is hardy to climatic zone 7 (tolerating temperatures down to about -10°c). This statement

1194

to be at all frost-tolerant. Hybridizes with other members of this genus[200]. The ripe seed is released explosively from the seed capsules[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This genus has been singled out as a potential source of latex (for making rubber) for the temperate zone, although no individual species has been singled out[141].

#### 7.2.351 Cornus nuttallii

Mountain Dogwood, Pacific dogwood, Western Dogwood 6 tlin 8 cyuc 1 kcak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cornus nuttallii is a deciduous Tree growing to 10 m (32ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: The fruit is possibly edible[177]. The fruit is about 10mm in diameter[200] and has a thin, mealy flesh[82].

tcanta Basketry Dye Tannin WoodAn intense brown dye is obtained by boiling the bark[257]. The bark is rich in tannin and has been used as a preservative [257]. The long slender branches have been used in making baby baskets[257]. Wood - exceedingly hard, heavy, strong, close grained. It is used for tool handles, cabinet making etc[46, 61, 82, 118].

dwatta Antiperiodic Febrifuge Laxative Malaria Tonic-The bark is antiperiodic, cathartic, febrifuge, laxative and tonic[46, 61, 118, 257]. An infusion is used as a quinine substitute in the treatment of malaria[46, 118, 226]. The infusion has also been used in the treatment of stomach complaints[257]. Externally, it is used to treat ulcers[257].

nrakta Western N. America - British Columbia to California and east to Idaho. ksacta Usually found in moist welldrained soils in the shade of coniferous trees to 1800 metres[82].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of about 3 days warm stratification at 15°c before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta Landscape Uses:Border, Specimen, Woodland garden. An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Another report says that it does not thrive in poor chalky soils[182]. Grows well in heavy clay soils. Succeeds in full sun or light shade[[188]. Plants are hardy to about -15°c[184], but they require long hot humid summers in order to promote good growth[200]. A very ornamental tree[1], but it is usually short-lived in Britain and does not do well in the north of this country[11]. There is some evidence to suggest that trees grow better on poor soils and can be killed by too much kindness. A very good tree has been seen on a poor gravel soil[182]. Closely related to C. florida[226]. This species is the floral emblem of British Columbia [226]. A number of named varieties have been developed for their ornamental value[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Blooms are very showy.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dvestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta E. Asia - S. China, Japan. ksacta Warmer areas of Japan[58]. Mixed mesophytic forests in mountain valleys at elevations of 200 - 2500 metres[266].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best. sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The seed ripens in its first year[200]. Plants grown under this name in Britain are often O. bambusifolia, Q. glauca, Q. salicina or Q. stenophylla[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.281 Saussurea costus

6 tlin 9 cyuc 2 kcak 0 tcan 3 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Saussurea costus is a PERENNIAL growing to 3 m (9ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe aromatic root is sometimes used as a spice[183]. It has a characteristic penetrating odour reminiscent of violet, orris and vetiver[183]

tcanta Essential Hair IncenseAn essential oil obtained from the roots is used medicinally, in perfumery, incenses and as a hair rinse when it is said to darken grey hair[61]. It has a strong lingering scent[238]. The smell is at first like violets, but as it ages it can become more fur-like or eventually become unpleasantly goat-like[245]. The roots are cut into lengths about 8cm long and then dried before being exported[211]. Smaller pieces of the root are ground into a powder and then used to make incense sticks[211]. The longer clean pieces are cut into very thin slices and then burnt at shrines or used as a tonic in hot baths[211].

dwatta Anodyne Antibacterial Antispasmodic Aphrodisiac Carminative Emmenagogue Skin Stimulant Tonic VermifugeCostus is a commonly used medicinal herb in China and is considered to be one of their 50 fundamental herbs[218]. It is also used in Avurvedic medicine where it is valued mainly for its tonic, stimulant and antiseptic properties[254]. It is said to be aphrodisiac and to be able to prevent the hair turning grey[254]. The root is anodyne, antibacterial, antispasmodic, aphrodisiac, carminative, skin, stimulant, stomachic, tonic and vermifuge[61, 147, 176, 218]. It is used internally in the treatment of abdominal distension and pain, chest pains due to liver problems and jaundice. gall bladder pain, constipation associated with energy stagnation, and asthma[238]. The root is harvested in the autumn or spring and either dried for later use or decocted for the essential oil[238]. It is normally used with other herbs[218]. The root is also used in Tibetan medicine where it is considered to have an acrid, sweet and bitter taste with a neutral potency[241]. It is used in the treatment of swelling and fullness of the stomach, blockage and irregular menses, pulmonary disorders, difficulty in swallowing and rotting/wasting of muscle tissues[241]. An oil from the root is very beneficial in the treatment of rheumatism[211].

nrakta E. Asia - Himalayas. ksacta A casual in irrigated areas, 2000 - 3300 metres from Pakistan to Himachel Pradesh[51]. Usually found in moist shady situations in Kashmir, sometimes forming the undergrowth in birch

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring might be possible.

nwatta Succeeds in most soils in a sunny well-drained position[1]. Cultivated as a medicinal plant and for its use in perfumery in the Himalayas[51, 245]. The dried root has something of the mossy smell of violets when fresh, becoming fur-like or even unpleasantly goat-like with age[245]. Most of the roots are exported to China and Japan and the plant forms quite a large article of commerce in Kashmir, the trade being controlled by the State[211]. Wild plants have been greatly over-collected and the plant has been placed on the CITES I list of endangered species - it is now illegal to dig them up for export[238].

### 7.2.282 Picea sitchensis

Sitka Spruce

1167

6 tlin 7 cvuc 2 kcak 0 tcan 2 dwat 50 m hkuc

htut cyutli tcuphja7n hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Picea sitchensis is an evergreen Tree growing to 50 m (164ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist or wet soil. The plant can tolerate maritime exposure. It cannot tolerate atmospheric pollution.

kcakta Edible Parts: Flowers Inner bark Seed SeedpodEdible Uses: Condiment Gum TeaYoung shoots raw[118, 256]. Young male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. The cones are 6 - 10cm long[82]. Inner bark - raw or cooked[256]. It can be dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. The inner bark was usually harvested in the spring, though it was also sometimes taken in the summer[256]. An emergency food, it is only used when all else fails. Seed - raw[172]. The seed is about 2 - 4mm long[229]. It is rich in fats and has a pleasant slightly resinous flavour but is too small and fiddly to be worthwhile unless you are desperate[172, K]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172]. A gum obtained from the bark is hardened in cold water and then used for chewing[118, 177, 256]. It should be aged for 3 days or more before using it. The best gum is obtained from the southern side of the tree

tcanta Adhesive Basketry Fuel Gum Pitch String Varnish Waterproofing WoodThe tough and flexible root is used in basket making and as a string[118, 229]. The roots were burnt over an open fire to remove the bark, then they were dried and split to make hats, ropes etc[257]. The main body

material of baskets was made from the roots. These were cut into lengths 75 - 90cm long and 12 - 25mm in diameter. Whilst still full of sap and soft, these were split into broad flat bands and these in turn were sub-divided by knife and teeth until the desired size was obtained - a little larger than coarse thread, about like small twine. The vertical rods were made of hazel (Corylus spp) and the overlay was bear grass (Xerophyllum tenax)[257]. The roots were used by several native North American Indian tribes to make tightly woven baskets that would hold water[226]. The limbs and roots can be pounded, shredded and used to make ropes[257]. A pitch is obtained from the tree and is used for caulking boats, waterproofing boxes etc[118, 257]. The rendered pitch has been used as a glue[257]. The pitch can be melted then used as a protective varnish-like coat on wood[257]. Wood - strong according to some reports[171, 229], not strong according to others[1, 11, 46]. The quality of the wood for aircraft construction is unsurpassed, it is remarkably strong yet light and its resistance - weight ratio is among the highest[226]. The wood is elastic, soft, light, straight grained. Equal in quality to P. abies but more quickly produced, the wood is used for shipbuilding, construction, packing cases, doors, posts etc[1, 11, 46, 226]. The wood is also valued for making musical instruments[226] and is widely used in the pulp industry to make paper[171]. The wood is a good fuel, knotted bits of wood would keep the fire burning all night[257].

dwatta Analgesic Antirheumatic Antiseptic Diuretic Laxative Ophthalmic Pectoral Poultice Salve Stomachic TB Vitamin CSitka spruce was widely employed medicinally by several native North American Indian tribes who used it especially for its antiseptic and pectoral qualities in the treatment of lung complaints, wounds, sores etc[257]. It is little, if at all, used in modern herbalism. The inner bark is laxative[256, 257]. It has been chewed in the treatment of throat problems, coughs and colds[257]. A decoction of the branch tips and the bark has been used in the treatment of rheumatism, stomach pains, constipation and gonorrhoea[257]. A decoction of the cones has been taken in the treatment of pain[257]. The cones have also been used in steam baths to treat rheumatism[257]. A decoction of the bark has been used as a steam bath in the treatment of back aches[257]. The resin is antiseptic and diuretic[257]. A decoction has been used in the treatment of gonorrhoea[257]. A poultice of the resin has been used as a rub on rheumatic joints[257]. Combined with Indian Hellebore roots (Veratrum viride), it has been used as a poultice on rheumatic joints[257]. The resin has also been used as a dressing or poultice on cuts, broken skin, boils, wounds, infections and suppurating sores[257]. The resin has been chewed as a breath freshener and as a treatment for TB[257]. The gum from new shoots and small branches has been placed in the eyes as a treatment for snow blindness[257]. A decoction of the roots has been used in the treatment of diarrhoea[257].

nrakta Western N. America - Alaska to N. California. ksacta Moist, sandy, often swampy soils, occasionally on wet rocky slopes in the far north of its range[82]. Alluvial soils from sea level to 300 metres, usually close to the coast[118].

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame [78]. A position in light shade is probably hest[78] Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semiripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Landscape Uses:Screen, Specimen. Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet, cold, poor and shallow soils[81]. Trees have succeeded on pure chalk when on a north facing hollow deep in beech woods[200]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Very tolerant of exposure[81], resisting salt laden gales[172].

though trees are not very wind firm in shallow soils[1]. A long-lived tree, with specimens 700 - 800 years old being recorded[229]. It is slow growing for its first two or three years, though it soon becomes an extremely fast growing tree and is very widely planted for timber in Britain and other temperate areas[11, 17]. Even trees 30 metres tall are increasing in height by 1 metre a year[185]. New growth takes place from May to July or August and some very vigorous trees will produce a second flush of growth until September 1851. Although the dormant tree is very cold-hardy, growth can be severely checked if the trees are growing in a frost hollow, because the young shoots are very susceptible to damage by late frosts[125, 185]. In Britain the best stands are produced in the sheltered valleys of W. Scotland. Trees are unsurpassed for rapid volume wood production in cool wet mountain sites on blanket peat in W. Britain[200]. In areas with cool wet summers (1200mm of rain per year) it makes a huge specimen tree[200]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[1, 200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus [200]. Many trees do not bear female flowers in most years. Subject to damage by the green spruce aphid[1], trees are also often attacked by a bark beetle and so should be kept away from more valuable plantings[125]. A biological control for the bark beetle is being introduced (1990)[125]. Special Features: North American native, Inconspicuous flowers or

#### 7.2.283 Ehretia dicksonii

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Ehretia dicksonii is a deciduous Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. No further details. The fruit is about 2cm in diameter[200].

tcanta WoodWood - light and tough. Used for carrying poles[46, 109].

nrakta E. Asia - Japan and southern China. ksacta Warm rocky valleys in the warmer areas of C. and S. Japan[58]. In evergreen forests near the sea[275].

propta Seed - we have no information on this species but suggest sowing it as soon as it is ripe in a greenhouse. Sow stored seed in late winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a moderately fertile well-drained sandy loam in a sunny position[200]. Requires a sheltered position[200]. Plants are shade tolerant in continental climates but they require more sun in maritime areas in order to ripen the wood[200]. Rich fertile soils tend to encourage soft sappy growth which is then subject to frost damage over winter[200]. Succeeds on chalky soils[200]. Mature plants are frost hardy, though young plants are often cut back by the frost[200]. The young growth in spring is also susceptible to frost-damage[K]. A tree was 6 metres tall at Kew in 1989[K]. This species closely resembles Ehretia macrophylla Wall. of the E. Himalaya, but the latter has the thin chartaceous, narrower leaves without scabrous on the upper surface and with sparse pubescent hairs on the lower surface, and smaller drupes, ca. 8 mm in diam[275]. The flowers, which are borne

diseases[218]. A gum from the stems is used in the treatment of foul sores[218]. The down of the seeds is used in the treatment of fevers, haemorrhages, jaundice, rheumatism etc[218]. The fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

nrakta The origin of this species is obscure. ksacta Not known in a truly wild situation.

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy. Plant into their permanent positions in the autumn. Cuttings of half-ripe wood. Iune to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Rarely thrives on chalk[200]. This species rarely thrives in Britain[11], it is very subject to canker and has been largely replaced in cultivation by S. 'Chrysocoma'[188]. The root system is rather aggressive and can cause problems with drains[200]. Hybridizes freely with other members of this genus[200]. Hybridizes freely with other members of this genus[200]. Hybridizes freely with other members of this genus[200]. Hybridizes freely with other members or this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Not North American native, Wetlands plant, Inconspicuous flowers or blooms.

### 7.2.347 Platycarva strobilacea

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Platycarya strobilacea is a deciduous Tree growing to 12 m (39ft) by 12 m (39ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177]. A famine food, only used when all else fails[179].

tcanta Dye Fuel IncenseA black dye is obtained from the fruits. It is used for dyeing cloth[46, 61, 109]. A black dye is obtained from the bark. It is used for dyeing nets[46, 61]. (It quite possibly contains tannin which will also help to preserve the nets[K].) The root is very fragrant when it is burnt. It is used in baths[178]. The wood is a good fuel[178].

nrakta E. Asia - China, Korea. ksacta Thickets and woods from sea level to 1300 metres[109]. Mixed forests on mountain slopes, sometimes on limestone, at elevations of 400 -2,200 metres[266].

propta The seed is best sown as soon as it is ripe in a cold frame. Stored seed requires a period of cold stratification[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving the plants some protection from the cold for at least their first winter outdoors. Lavering[200].

nwatta Requires a deep moist humus-rich loam and a sunny sheltered position[200]. Trees are hardy to about - 12°c in Britain[200], but they are not usually a success in our climate[1], preferring a warm dry continental climate[200]. A tree in Hampshire is growing and fruiting well[11]. A tree at Kew flowered heavily in the hot summer of 1989[K].

#### 7.2.348 Rhododendron arboreum

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat

hpa7tmwatli xre7t hjonli

drutta Rhododendron arboreum is an evergreen Shrub growing to 12 m (39ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The leaves are poisonous[51, 240]. The flowers can cause intoxication in large quantities[183].

kcakta Edible Parts: Flowers LeavesEdible Uses: The tender leaves are used as a cooked vegetable[105, 158, 183]. Caution is advised, see the notes above on toxicity. Flowers - raw or cooked[272]. A sweet-sour taste, they are said to make a good sub-acid jelly[183]. Th flowers are sometimes simply pickled by adding salt and chili[272]. Caution is advised, large quantities can cause intoxication[2, 183].

tcanta Charcoal Fuel Repellent WoodThe juice of the leaves is spread over cots and beds to get rid of bed lice[272]. Wood - soft, even grained, seasons badly. Used in turnery, it can also be used to make charcoal and for fuel[51, 158]. Th wood is much employed in Nepal where it is used for making household implements, building small houses and fences[272]. Planks of the wood are carved to make boxes, cupboards and other furniture[272]. It is a very good fuel, burning well with a long-lasting heat - overcollection of the wood for fuel, and also for making charcoal, has become a cause for conservation concern[272].

dwatta Astringent Dysentery Poultice StomachicThe young leaves are astringent and poultice[158]. They are made into a pasteand then applied to the forehead in the treatment of headaches[240, 272]. The juice of the bark is used in the treatment of coughs, diarrhoea and dysentery[272]. A decoction of the flowers is used to check a tendency to vomit, especially if there is also a loss of appetite[272]. The juice of the flowers is used in the treatment of menstrual disorders[272]. The petals are eaten to assist the removal of any animal bones that have become stuck in the throat[262].

nrakta E. Asia - Himalayas to Sri Lanka. ksacta Forests and shrubberies with Pieris ovalifolia and Quercus incana, 1500 - 3600 metres from Pakistan to S.E. Tibet in the Himalayas[51].

propta Seed - best sown in a greenhouse as soon as it is tipe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in most humus rich lime free soils except those of a dry arid nature or heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. Requires a pH between 4.5 and 5.5[200]. Hardy to between -10 and -15°c, the pink flowered form is hardier than the red[184]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. There are many named varieties selected for their ornamental value[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. This plant is the national flower of Nepal[51]. The flowers are sold in local markets and used as offerings to the Gods and Godesses[272]. A very ornamental plant[1], it is not very hardy outdoors in much of Britain, but grows well in the milder areas of the country[1]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.349 Sorbus vestita

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

water[80] then cold stratify for 2 - 3 months[98, 113]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year[240]. Cuttings of halfripe wood, July/August in a frame[113]. Cuttings of mature shoots, November in a frame. Only use vigorous shoots[113]. Layering. Division of suckers in the dormant season[188].

nwatta Prefers a sunny position in a rich strong loam with abundant moisture at the roots[11, 200]. Grows well by water[11]. Succeeds in areas that do not experience prolonged winter temperatures below about -12°c[200], but young plants and the young shoots of older trees can be cut back by winter frosts[11]. A very ornamental tree[1], it fruits freely in Britain[11]. The leaves are sweetly resinous[245]. The deeply furrowed bark is aromatic[245]. Produces suckers profusely[98]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.344 Aphananthe aspera

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 20 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Aphananthe aspera is a deciduous Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. The fruit is about 6 - 8mm in diameter[200].

tcanta Fibre Paper Sandpaper WoodThe leaves, gathered in autumn, are used as a sandpaper on wood[46, 61]. The fibre from the bark is used for manufacturing ropes and staple rayon[266]. The wood is fine and strong[266].

nrakta E. Asia - China, Japan, Korea. ksacta Lowlands and hills, C. and S. Japan[58]. Hills, valleys, stream sides and slopes at elevations of 100 - 600 metres (500 - 1000 metres in E and N China)[266].

propta Seed - it probably requires 2 - 3 months stratification. It is best to sow the seed as soon as it is ripe in a cold frame, otherwise sow as soon as possible in the year. Remove any pulp from the seed before sowing it[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter before planting them out in late spring or early summer, after the last expected frosts.

nwatta Succeeds in most soils, including dry gravels, but prefers a deep fertile soil[200]. Plants are frost tender when young but they are able to regrow from the base if cut back[11]. A tree growing outdoors at Kew Botanical Gardens has reached a height of 8 metres[11].

#### 7.2.345 Juniperus recurva

Himalayan Juniper 6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus recurva is an evergreen Tree growing to 12 m (39ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The cones are up to 11mm long and 8mm wide[200].

tcanta Essential IncenseThe wood and leaves are used as an incense[272]. The resinous twigs are burnt as an

incense[2, 146]. The leaves contain about 1.7% essential oil[272].

dwatta EmeticSmoke from the green wood is emetic and produces long-continued vomiting[240].

nrakta E. Asia - Himalayas to N. Burma. ksacta Wetter areas of the Himalayas, to 4600 metres[51]. Forests and thickets at elevations from 1800 - 3900 metres in SE Xizang and NW Yunnan[266].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 811. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78], Lavering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11] and succeeding on chalk[200]. Prefers a humid sheltered site, doing well in areas with high rainfall[200]. Does not succeed in dry areas[200]. Unlike most members of the genus, this species grows better in the wetter western part of Britain[11]. A very ornamental plant[1] but slow growing in Britain, even young trees fail to average 25cm a year[185]. Plants are resistant to honey fungus[88]. Dioecious. Male and female plants must be grown if seed is required.

#### 7.2.346 Salix babylonica

Weeping Willow, Babylon Weeping Willow 6 tlin 9 cyuc 1 kcak 4 tcan 3 dwat 12 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Salix babylonica is a deciduous Tree growing to 12 m (39ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in April, and the seeds ripen in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Inner bark Leaves MannaEdible Uses: TeaInner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots and flower buds - cooked[105, 177, 183]. Not very palatable[172]. Older leaves are used to adulterate tea[183]. A source of a mannalike substance[183].

tcanta Basketry Hair Soil stabilizationLandscape Uses: Erosion control, Aggressive surface roots possible, Pollard, Specimen. The stems are very flexible and are used in basket making[146, 272]. The plant is usually coppiced annually when grown for basket making, though it is possible to coppice it every two years if thick poles are required as uprights. The extensive root system makes this species useful for binding soils[146, 272]. A decoction or infusion of the bark has been used as a wash to make the hair grow[257]. Dynamic

dwatta Anodyne Antirheumatic Astringent Febrifuge Poultice SkinThe leaves and bark are antirheumatic, astringent and tonic[178, 240]. A decoction of the leaves is used in the treatment of abscesses, carbuncle, fever, rheumatism, skin diseases, ulcers etc[218]. An infusion of the bark has been used to treat diarrhoea and fevers[257]. The bark can be used as a poultice[257]. The stem bark is used in the treatment of skin eruptions due to parasities[218]. The root bark is used in a bath for the treatment of parasitic skin

on the ripened wood of the previous season's growth, emit a powerful spicy fragrance [245].

A polymorphic species [17], it also hybridizes readily with other members of the genus [230]. This species is a colo-

### 7.2.284 Dactylorhiza incarnata

Marsh Orchid

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Dactylorĥiza incarnata is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. Very nutritious[4, 46, 61]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe, including Britain, north to Norway and east to W. Asia. ksacta Wet meadows and marshes in rich soils[17, 42].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division in autumn. The plant is very intolerant of root disturbance, any moving or dividing should be attempted in the autumn, keep a large ball of soil around the plant[1]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Very easily grown in any good moist soil[42]. Another report says that it requires a deep rich soil[1]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

A polymorphic species[17], it also hybridizes readily with other members of the genus[230]. This species is a colonizer of disturbed ground and bare soils, new colonies can spring up many kilometres from the plants nearest known locality[230]. They have been known to colonize sites such as waste heaps of clinker at power stations[230]. Plants are very impatient of root disturbance[1].

### 7.2.285 Dryopteris carthusiana

Narrow Buckler Fern, Spinulose woodfern 6 tlin 8 cyuc 2 kcak 0 tcan 4 dwat 1 m hkuc hmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Dryopteris carthusiana is a FERN growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

pcista Although we have found no reports for this species, a number of ferns contain carcinogens so some caution is advisable[200]. The fresh plant contains thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people eating an adequate diet that is rich in vitamin B, though large quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172]. However, there have been reports for other species of ferns suggesting that even cooked fronds can have a long term harmful effect. Some caution is therefore advised.

koakta Edible Parts: Leaves RootEdible Uses: Root -baked[61]. Some caution is advised, see notes above on toxicity. Old leafstalks on the underground stems can be roasted, peeled and the inner portion eaten[257]. Young curled fronds, harvested as they are developing in the spring, can be boiled and eaten like asparagus[257].

tcanta When spaced about 30cm apart each way, the plants can be grown as a ground cover[208].

dwatta VermifugeThe root contains 'filicin', a substance that paralyses tapeworms and other internal parasites and has been used as a worm expellent[4, 222, 238]. It is one of the most effective treatments known for tapeworms - its use should be immediately followed by a non-oily purgative such as magnesium sulphate in order to expel the worms from the body[238]. An oily purge, such as caster oil, increases the absorption of the fern root and can be dangerous[238]. The root is harvested in the autumn and can be dried for later use, it should not be stored for longer than 12 months[238]. This remedy should be used with caution and only under the supervision of a qualified practitioner[238]. The root is toxic and the dosage is critical[238]. See also the notes above on toxicity.

nrakta Europe, including Britain, from Scandanavia south and east to Spain and Siberia. N. America.. ksacta Damp and wet woods, marshes and wet heaths[17].

propta Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at  $20\,^\circ\text{c}$ . Pot up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Landscape Uses:Foundation, Ground cover, Massing, Woodland garden. Prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position[175, 200]. Requires permanently moist conditions at its roots. A very ornamental plant[1], it is often evergreen in mild winters[188]. Plants spread slowly at the rootstock[233]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features:Attractive foliage, Not North American native, Naturalizing, There are no flowers or blooms.

### 7.2.286 Gymnadenia conopsea

Fragrant Orchid

6 tlin 9 cvuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Gymnadenia conopsea is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Moths. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. Very nutritious[4, 46, 61]. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a flour[2, 105, 177]. Salep is a starch-like substance with a sweetish taste and a faint somewhat unpleasant smell[4]. It is said to be very nutritious and is made into a drink or can be added to cereals and used in making bread etc[100, 183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe, including Britain, to north and west Asia. ksacta Locally abundant in base-rich grassland, especially on chalk or limestone, fens and marshes[17].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division in autumn. The plant is very intolerant of root disturbance, any moving or dividing should be attempted in the autumn, keep a large ball of soil around the plant[1]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths. whilst the new rosette should continue in growth and flower normally[230]

nwatta Very easily grown in any good moist soil[42]. Requires a deep rich soil[1]. Orchids are, in general, shallowrooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. A polymorphic species[17], it also hybridizes readily with other members of the genus[230]. The flowers have a delicious perfume which is more pronounced at night in order to attract Night Hawkmoths for pollination[245]. The sub-species G. conopsea densiflora has larger, more strongly scented flowers[245]. This species is a colonizer of disturbed ground and bare soils, new colonies can spring up many kilometres from the plants nearest known locality[230]. They have been known to colonize sites such as waste heaps of clinker at power stations[230]. Plants are very impatient of root disturbance[1].

### 7.2.287 Acer palmatum

Japanese Maple

6 tlin 8 cyuc 2 kcak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasilutnyikfrip hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Acer palmatum is a deciduous Tree growing to 8 m (26ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH; mildly acid. neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves SapEdible Uses: The sap contains a certain amount of sugar and can either be used as a drink, or can be concentrated into a syrup by boiling off the water[105, 177, 183]. The syrup is used as a sweetener on many foods. The concentration of sugar is considerably lower than in the sugar maples (A. saccharum). The tree trunk is tapped in the early spring, the sap flowing better on warm sunny days following a frost. The best sap production comes from cold-winter areas with continental climates. Leaves - cooked[105, 177, 179]. We have eaten nicer

tcanta PreservativeThe leaves are packed around apples, rootcrops etc to help preserve them[18, 20].

nrakta E. Asia - Japan ksacta Woods and thickets in a wide range of soils and exposures in lowland and mountains to 3000 metres in C. and S. Japan[58, 200].

propta Seed - best sown as soon as it is ripe in a cold frame, it usually germinates in the following spring. Pre-soak stored seed for 24 hours and then stratify for 2 - 4 months at 1 - 8°c. It can be slow to germinate. The seed can be harvested 'green' (when it has fully developed but before it has dried and produced any germination inhibitors) and sown immediately. It should germinate in late winter. If the seed is harvested too soon it will produce very weak plants or no plants at all[80, 113]. When large enough to handle, prick the seedlings out into individual pots and grow them on until they are 20cm or more tall before planting them out in their permanent positions. Layering, which takes about 12 months, is successful with most species in this genus. Cuttings of young shoots in June or July. The cuttings should have 2 - 3 pairs of leaves, plus one pair of buds at the base. Remove a very thin slice of bark at the base of the cutting, rooting is improved if a rooting hormone is used. The rooted cuttings must show new growth during the summer before being potted up otherwise they are unlikely to survive the winter. Only strong-growing cultivars succeed from cuttings, plants of the dissected or variegated cultivars will rarely grow into good

nwatta Landscape Uses:Border, Pest tolerant, Rock garden, Standard, Specimen, Woodland garden. Of easy cultivation, it succeeds in most soils preferring a good moist well-drained soil on the acid side and partial shade[11, 182]. Grows well in heavy clay soils. Chlorosis can sometimes develop as a result of iron deficiency when the plants are grown in alkaline soils, but in general maples are not fussy as to soil pH. Requires some shelter in the cooler areas of Britain and protection from cold drying winds[1]. Plants are hardy to about -25°c[184], but spring growth is subject to damage by late frosts[11]. A very ornamental tree[1], it is a polymorphic species[1] and there are many named varieties[11, 1821. Grows well with rhododendrons. Most maples are bad companion plants, inhibiting the growth of nearby plants[18, 20]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

increase in height for at least the first 50 years[185]. Trees can produce cones when only 10 years old, though 30 - 40 years is more usual[229]. Good crops are produced most years in the wild[229]. The cones are 5-15cm long, they open and shed their seed whilst still attached to the tree and usually persist on the tree for a further year [82, 226]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow under the trees[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Attracts birds, North American native, Inconspicuous flowers or blooms.

### 7.2.341 Nothofagus pumilio

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 40 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hna7tmwatli hionli

drutta Nothofagus pumilio is a deciduous Tree growing to 40 m (131ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Inner bark SapEdible Uses: The sap and scrapings are eaten in spring[69]. The term scrapings probably refers to the inner bark. Inner bark is often dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread.

tcanta Lighting WoodUsed for making torches[69]. This is probably a reference to the bark, since this is the part used in N. betuloides. Wood - useful[11]. No further details are

nrakta Southern S. America. ksacta Dominant or codominant in deciduous forest on better drained sites and well developed soils from sea level to 1800 metres[69].

propta The seed is best sown as soon as it is ripe in a cool greenhouse or cold frame. Spring-sown seed requires 2 - 3 months stratification at 1 - 5°c[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed must not be allowed to dry out according to one report[80] whilst another says that the seed can be stored dry at 2°c for long periods[200]. Cuttings of half-ripe wood, 6 - 10cm with a heel, July/August in a frame[78]. Layering.

nwatta Prefers an open well-drained loamy soil in a sunny position[1, 200]. Succeeds on most soils but dislikes calcareous soils[11]. Prefers a pH between 5 and 7, but dislikes acid peats[200]. Prefers cool wet summers in temperate maritime zones[200]. This species is closely related to N. Antarctica[11]. Trees have poor wind resistance in Britain, probably because they grow so fast[11]. Plants at Crarae in western Scotland are very hardy but fairly slow growing[191]. Trees up to 4 metres tall can be successfully established, though the optimum size for transplanting is about 30 - 80cm. The roots are very sensitive to desiccation and extreme care should be taken when transplanting them[200]. Plants in this genus are notably resistant to honey fungus[200].

### **7.2.342** Abies firma

Momi Fir, Japanese Fir

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 30 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hionli

drutta Abies firma is an evergreen Tree growing to 30 m (98ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes

can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist

kcakta Edible Parts: SeedEdible Uses: Seed roasted[105, 177]. No more details are given, but the seed is very small and fiddly to utilize[K].

tcanta WoodWood - light, soft, coarse grained, not very durable. Used for construction, pulp, etc[61].

nrakta E. Asia - S. Japan ksacta Hills and mountains, C. and S. Japan[58].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks [78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Landscape Uses:Christmas tree, Pest tolerant, Screen, Specimen. Prefers a good moist but not waterlogged soil[1]. Grows well in heavy clay soils. Plants are very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions, down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. New growth of the side shoots starts in April and this is very susceptible to damage by late frosts[11, 185]. The terminal buds do not open until mid-May and usually escape damage[185]. Trees are fairly fast growing when young, sending up new growth of 60cm a year from the age of about 6 years[185]. Side shoots grow with equal vigour, however and the tree often loses apical dominance[185]. Trees grow best in the Perthshire valleys of Scotland[11]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. The flowers are produced in axils of the previous year's shoots[275]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Special Features:Not North American native. There are no flowers or blooms

### 7.2.343 Pterocarya fraxinifolia

Caucasian Wingnut

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 30 m hkuc

htut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Pterocarva fraxinifolia is a deciduous Tree growing to 30 m (98ft) by 20 m (65ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed[2, 105]. No more details are given but the seed is very small and would be very fiddly to use[K].

tcanta Weaving WoodThe bast from the bark is used for weaving hats etc[74]. Wood - soft, hard to split. Used for matches, shoes etc[46, 61].

dwatta DiaphoreticDiaphoretic[74].

nrakta W. Asia - Iran and the Caucasus, ksacta Mixed woods near rivers in boggy or inundated places[74].

propta Seed - best sown as soon as it is ripe in a cold frame[80, 113]. Pre-soak stored seed for 24 hours in warm 61, 82, 171, 226, 229]. It is also a major source of pulp[226]. The wood makes a slow-burning fuel and so can be used to bank up a fire to keep it burning overnight[257].

dwatta Astringent Diaphoretic Diuretic Parasiticide Poultice SkinWestern hemlock was commonly employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. It is little, if at all, used in modern herbalism. The bark is astringent, diaphoretic and diuretic[21]. A decoction of the pounded bark has been used in the treatment of haemorrhages, tuberculosis and syphilis[257]. The boiled bark, combined with liquorice fern (Polypodium glyccyrhiza), has been used in the treatment of haemorrhages[257]. An infusion of the inner bark or twigs is helpful in the treatment of kidney or bladder problems[21]. It can also be used as a good enema for treating diarrhoea and as a gargle or mouthwash for mouth and throat problems[21]. Externally, it can be used as a wash on sores and ulcers[21, 257]. A poultice of the plant has been applied to bleeding wounds[257]. A moxa of the twigs has been used to get rid of warts[257]. The powdered bark can be put into shoes for tender or sweaty feet or for foot odour[21]. The gum obtained from the trunk has been applied to cuts[257]. It has been applied to the skin to prevent chapping and sunburn[257]. A poultice of the chewed leaves has been used in the treatment of burns[257].

nrakta Western N. America - Alaska to N. California, ksacta Forests, especially where moist and especially in deep forests from sea level to 1500 metres[60, 270].

propta Seed - it germinates better if given a short cold stratification[80, 113] and so is best sown in a cold frame in autumn to late winter. It can also be sown in early spring. though it might not germinate until after the next winter. If there is sufficient seed, an outdoor sowing can be made in spring[78]. Pot-grown seedlings are best potted up into individual pots once they are large enough to handle - grow them on in a cold frame and plant them out in early summer of the following year. Trees transplant well when they are up to 80cm tall, but they are best put in their final positions when they are about 30 - 45 cm or less tall, this is usually when they are about 5 - 8 years old[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

nwatta Landscape Uses:Hedge, Aggressive surface roots possible, Screen, Specimen, Woodland garden. An easily grown plant, it thrives best when growing in a deep welldrained soil in the western parts of Britain where it appreciates the higher rainfall[11]. However, it succeeds in most soils and positions, being especially good on acidic sandy soils[81] but also tolerating some lime[11] so long as there is plenty of humus in the soil[208]. Plants are very shade tolerant when young, but need more sunlight as they grow older[81, 200]. Plants are thin and poor when grown in dry or exposed places[200]. Occasionally cultivated for its timber in Britain, it can grow 60 - 150cm per year[11, 185]. New growth takes place from mid-May to mid-September, at first it hangs downwards but begins to straighten towards the end of the season[185]. There are trees more than 50 metres tall in Britain[200]. Trees live for several centuries in the wild and often produce large quantities of seed[229]. Plants often form pure stands and cast a dense shade, thus preventing the regeneration of other trees whilst being able to reproduce itself[226]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native. Inconspicuous flowers or blooms

#### **7.2.340** Pinus taeda

Loblolly Pine

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 40 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprik

hpa7tmwatli dyat hjonli

drutta Pinus taeda is an evergreen Tree growing to 40 m (131ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from March to May, and the seeds ripen from October to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the

shade. It prefers dry or moist soil and can tolerate drought. pcista The wood, sawdust and resins from various species of pine can cause dermatitis in sensitive people[222].

kcakta Edible Parts: Edible Uses: CondimentA vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Herbicide Resin WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. This tree is a source of resin but it is not exploited commercially [64]. The flow of resin checks too guickly and labour costs are too high[227]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile [64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - weak, brittle, coarse grained, resinous, not durable[61, 82, 171, 229]. The wood weighs 34lb per cubic foot[227]. Used for lumber, cooperage, crates, the interior of buildings, pulp etc[61, 82, 171,

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

nrakta South-eastern N. America - New Jersey to Florida and Texas. ksacta Flatlands or rolling hills from sea level to 700 metres[229]. Found on a variety of soil types from low poorly drained areas to well drained soils, but usually on poor upland soils[229].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are guite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Agroforestry Services: Windbreak Industrial Crop: Hydrocarbon Management: Standard Regional TimberLandscape Uses:Pest tolerant, Aggressive surface roots possible, Specimen. Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200]. This species comes from an area with long hot summers and mild winters[229]. It is fast growing and is cultivated as a timber tree on a small scale in Europe[50]. It does not grow well in Britain, however[1]. The trees are fully hardy in this country except when they are young[81]. Rarely found in Britain, the few trees that have been planted are all found in southern England and are all growing well[185]. It is proving to be a fairly vigorous tree here, averaging 30cm annual

#### 7.2.288 Carduus nutans

Musk Thistle, Nodding plumeless thistle 6 tlin 9 cyuc 2 kcak 3 tcan 2 dwat 0.9 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Carduus nutans is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist

kcakta Edible Parts: Oil StemEdible Uses: Curdling agent OilPith of stem - boiled[61]. A pleasant taste[105], it is eaten like asparagus[177]. Said to be delicious[183]. The dried flowers are used as a curdling agent for plant milks etc[61, 183].

tcanta Oil PaperThe down of the plant is used to make paper[4]. The seed of all species of thistles yields a good oil by expression[4]. This species contains 41 - 44% oil[240]. The plant is very attractive to bees, hoverflies and butterflies[13, 245], it is a food plant for the caterpillars of many lepidoptera species[30]. Dynamic accumulator.

dwatta Blood purifier FebrifugeThe flowers are febrifuge and are used to purify the blood[145, 240]. The seeds contain a fixed oil that is rich in linoleic acid[240]. This has proved of benefit in the prevention of atherosclerosis[240].

nrakta Most of Europe, including Britain, north to Norway, south and east to N. Africa, Siberia and W. Asia ksacta Pastures, arable fields and waste places on calcareous soils[17].

propta Seed - sow spring in situ.

nwatta Succeeds in a sunny position in ordinary garden soil[1, 200]. The flowers, and indeed the whole plant, give off a pleasing musk-like perfume[245]

### 7.2.289 Berberis empetrifolia

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis empetrifolia is an evergreen Shrub growing to 0.3 m (1ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 69, 105, 177]. The fruits are about 7mm long[200]. tcanta DyeA yellow dye is obtained from the root and

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine [218]. Berberine has also shown antitumour activity[218].

nrakta S. America - S. Argentina, S. Chile. ksacta Waste ground near the sea and at elevations up to 1300 metres[67,

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it

can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Pot up in the spring[113]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Plants are hardy to about -15°c[184]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back guite severely, they resprout well from the base[200].

### 7.2.290 Gaultheria pumila

6 tlin 9 cvuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Gaultheria pumila is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.6 m (2ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Used like huckleberries[11, 69, 177]. The fruit is up to 22mm in diameter[200].

nrakta S. America - Falklands, S. Chile. ksacta Heath, bogs, swamps, open wet places and woods to 900 metres, north to latitude 50° south in Chile[69].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a limefree compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°c, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping of[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins. 'Drop' the plants 12 months earlier by digging them up and replanting them deeper in the soil so that the branches are buried and can form roots. This works best in a sandy soil[78]. It is best to pot up the divisions and grow them on in a lightly shaded position in a greenhouse until they are established. Plant them out in the summer. Layering in September/October. Takes 12 months[78].

nwatta Requires a light moist but well-drained humusrich lime-free soil in sun or semi-shade[1, 11]. Grows well in a rock garden[11]. Fruits are produced abundantly on plants growing in the wild[11]. Dioecious. Male and female plants must be grown if seed is required. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.291 Lavandula latifolia

Spike Lavender, Broadleaved lavender 6 tlin 9 cvuc 2 kcak 5 tcan 2 dwat 0.4 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Lavandula latifolia is an evergreen Shrub growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is

pollinated by Bees, Lepidoptera (Moths and Butterflies). It August, The species is hermaphrodite (has both male and feis noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers welldrained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: CondimentLeaves raw[2, 15]. Used as a condiment in salads[177]. Very aromatic[7], they cannot be eaten in quantity[K]. An essential oil from the flowers is used as a food flavouring[183].

tcanta Essential Incense Pot-pourri RepellentAn essential oil is obtained from the flowers - used in soap making, perfumery, food flavouring, veterinary medicines, porcelain painting etc[46, 61]. This species yields up to three times the quantity of essential oil than is obtained from L. angustifolia, but the quality is inferior to that species[4, 11, 171]. When growing the plant for its essential oil content, it is best to harvest the flowering stems as soon as the flowers have faded[245]. The aromatic leaves and flowers are used as an insect repellent in the linen cupboard etc[46, 61]. They are also used in pot-pourri[245] and are said to repel mice[20]. The flowering stems, once the flowers have been removed for use in pot-pourri etc, can be tied in small bundles and burnt as incense sticks[245].

dwatta Abortifacient Antibacterial Antiseptic Antispasmodic Aromatherapy Carminative EmmenagogueSpike layender has similar medicinal properties to common layender (L. angustifolia). It yields more essential oil than that species but is of inferior quality[254]. The flowering stems, and the essential oil obtained from them, is abortifacient, antibacterial, antiseptic, antispasmodic, carminative and emmenagogue[46, 61, 254]. They can be used in all the ways that common layender is used, externally to treat wounds. burns, insect stings etc and internally to treat digestive disorders[254]. The essential oil is used in aromatherapy. Its keyword is 'Immune system'[210].

nrakta Europe - W. Mediterranean. ksacta Arid hillsides, especially on limestone[184].

propta Seed - sow spring in a greenhouse and only just cover the seed[4]. It usually germinates in 1 - 3 months at 15°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings of half-ripe wood 7 - 10cm with a heel, July/August in a frame. Usually very east, a high percentage will root within a few weeks[78]. Grow them on in the greenhouse for their first winter and plant them out in late spring after the last expected frosts. Cuttings 7cm with a heel succeed at almost any time of the vear[1]. Lavering.

nwatta Succeeds in almost any soil so long as it is welldrained and not too acid[1, 200]. Prefers a sunny position in a neutral to alkaline soil[14, 200]. Prefers a light warm dry soil[37]. When grown in rich soils the plants tend to produce more leaves but less essential oils[4]. Very tolerant of salt wind exposure. Established plants are drought tolerant[190]. When growing for maximum essential oil content, the plant must be given a very warm sunny position and will do best in a light sandy soil, the fragrance being especially pronounced in a chalky soil[245]. This species of layender is cultivated for its essential oil in S. France and England[46, 61]. It is very closely related to L. angustifolia but perhaps not so hardy, tolerating temperatures down to about -10°c[11, 200]. Plants are not very long-lived and soon become straggly unless pruned. Any trimming of the plant is best done in spring and should not be done in the autumn since this can encourage new growth that will not be very cold-hardy[200]. A good bee plant[7, 24], also attracting butterflies and moths[30]. A good companion for most plants[54], growing well with cabbages[14].

## 7.2.292 Thymus mastichina

6 tlin 9 cvuc 2 kcak 0 tcan 2 dwat m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Thymus mastichina is an evergreen Shrub growing to 0.3 m (1ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to

male organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe leaves are used as a seasoning[183]. They have a pungent eucalyptus-like aroma[238]. If the leaves are to be dried, the plants should be harvested in early and late summer just before the flowers open and the leaves should be dried quickly[200]. The plant is also the source of an essential oil, called 'oil of marjoram', that is used extensively as a flavouring for soups etc[4, 61, 177, 183, 238].

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantThe leaves. and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[4, 200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

nrakta S.W. Europe - Spain, Portugal. ksacta Dry hills[50], rocky ground and roadsides[238].

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Requires a light well-drained preferably calcareous soil in a sunny position[1, 200]. Succeeds in dry soils. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to about -10°c[200], but are best given some protection in the winter - a pane of glass supported over the plant is usually sufficient[1]. The flowers are rich in nectar and are very attractive to honey bees[200]. The bruised leaves are powerfully aromatic[245]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[1].

### 7.2.293 Camellia oleifera

Tea-Oil Plant, Tea Oil Camellia 6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia oleifera is an evergreen Shrub growing to 4 m (13ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from October to April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers welldrained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Oil OilEdible Uses: Oil OilAn oil obtained from the seed is used in cooking[2, 11, 109].

tcanta Dve Insecticide Oil OilA non-drying oil is obtained from the seed - used in textile manufacture, soap making and as an illuminant[1, 11, 166, 178]. The oil consists mainly of olein. It is not subject to polymerize or oxidize, nor does it form solids at low temperatures[174]. A grey dye is obtained from the pink or red petals[168]. The seed cake has insecticidal activity[218].

dwatta AnthelminticThe seed oil is used in the treatment of ringworm[218].

tcanta DveA vellow dve is obtained from the fresh or dried leaves[168]. Plants can be used as a ground cover in a sunny position[188]. They are best spaced about 3.5 metres apart each way[208]. They can be encouraged to cover the ground by laying brushwood flat on the ground and pegged into position. The twigs would eventually rot and the plant would assume complete and constant control[208].

nrakta E. Asia - China. ksacta Usually found growing into trees and shrubs in thickets on hillsides and in valleys[109, 266].

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth. December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. The young growth in spring can be damaged by late frosts. Plants climb by means of tendrils[182]. They grow particularly well into elm trees[18]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants are occasionally cultivated for their edible fruits[46, 61]. Plants in this genus are notably susceptible to honey fungus[200].

#### 7.2.338 Ouercus acuta

Japanese Evergreen Oak 6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 25 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Quercus acuta is an evergreen Tree growing to 25 m (82ft 0in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed cooked[105, 177]. About 2cm long[200]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tanning, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is guicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dvestuff[4].

dwatta Astringent DysentervAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta E. Asia - China, Japan, N. Korea. ksacta Not

propta Seed - quickly loses viability if allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed but must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Screen, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Unsuitable for chalky soils[1]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. A very ornamental tree[1], it grows best in the milder areas of the country[11]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus [200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or

### 7.2.339 Tsuga heterophylla

Western Hemlock

6 tlin 7 cyuc 1 kcak 0 tcan 2 dwat 70 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli hionli

drutta Tsuga heterophylla is an evergreen Tree growing to 70 m (229ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Inner barkEdible Uses: Condiment Gum TeaInner bark - raw or cooked[213, 257]. It can be dried, ground into a powder and then used as a thickening in soups etc or mixed with cereals when making bread[161]. It has also been used as a sweetener for other foods[257]. The inner bark was often cooked and then dried for use in the winter[256]. At its best in spring[172], it was one of the staple foods of the Alaskan Indians[82]. An emergency food, it is only used when all else fails[183]. The leaves and twigs yield 'spruce oil', used commercially to flavour chewing gum, soft drinks, ice cream etc[183]. Pitch, obtained from crevices in the bark, has been chewed as a gum[257]. The leaves and young shoots have been chewed as an emergency food to keep one alive when lost in the woods[257]. A herbal tea is made from the leaves and shoot tips[172, 183]. These tips are also an ingredient of 'spruce beer'[183].

tcanta Dye Fuel Gum Hedge Hedge Parasiticide Resin Rust Tannin WoodYields a resin similar to Abies balsamea, it is gathered by incisions in the trunk or by boiling the wood[46, 61, 64]. The bark contains 8 - 18% tannin and is a major source of tannin in America[46, 82, 171, 226]. A reddish-brown dve is obtained from the bark[21, 46, 257]. A decoction of the bark has been used to clean rust off iron and steel[257]. A pitch (called hemlock pitch), is obtained by distillation of the young branches[46]. The pitch is rubbed on the hair to get rid of head lice[257]. Tolerant of light trimming, plants can be grown as a hedge[81]. This species makes a good hedge in Britain[124, 200]. Wood - light, hard, tough, easy to work. Commercially superior to other members of this genus, it is an important tree for construction, the outside of buildings etc and for carving into spoons etc[46,

nwatta Prefers a woodland soil or a sandy loam with leafmould[1]. Grows well in shady rather moist places[1]. A Mediterranean plant, it commences growth in the autumn and, since the leaves are not very hardy, the plant is best grown under protection[90]. It should succeed outdoors at least in the milder parts of the country, if grown in a sheltered woodland. The plant is hardy to about -10°c for short periods but should be given a good mulch in the winter[200]. The plant becomes dormant in spring/summer[200].

### 7.2.335 Crataegus apiifolia

Parsley-Leaved Hawthorn

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 4 m hkuc

hmimhtut cyutli hgattcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Crataegus apiifolia is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Midges. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The fruit can be used in making pies, preserves, etc. and can also be dried for later use. About 7.5mm in diameter[200] with a thin flesh[227]. There are up to five fairly large seeds in the centre of the fruit, these often stick together and so the effect is of eating a cherry-like fruit with a single seed[K].

tcanta RootstockUsed as a dwarfing rootstock for C. aestivalis[183]. Wood - heavy, hard, strong, close-grained[82, 227, 235]. It weighs 46lb per cubic foot[227, 235]. It has no particular commercial value[227], though it is useful for making tool handles, mallets and other small items[82].

dwatta Cardiotonic HypotensiveAlthough no specific mention has been seen for this species, the fruits and flowers of many hawthorns are well-known in herbal folk medicine as a heart tonic and modern research has borne out this use. The fruits and flowers have a hypotensive effect as well as acting as a direct and mild heart tonic[222]. They are especially indicated in the treatment of weak heart combined with high blood pressure[222]. Prolonged use is necessary for it to be efficacious[222]. It is normally used either as a tea or

nrakta Southern N. America - Virginia to Florida, west to Texas and Missouri. ksacta Along streams and the borders of swamps[235]. Also found in hummocks in pine barrens near the coast[82]. Acidic sandy soils, woods and roadsides in Texas[274].

propta Seed - this is best sown as soon as it is ripe in the autumn in a cold frame, some of the seed will germinate in the spring, though most will probably take another year. Stored seed can be very slow and erratic to germinate, it should be warm stratified for 3 months at 15°c and then cold stratified for another 3 months at 4°c[164]. It may still take another 18 months to germinate[78]. Scarifying the seed before stratifying it might reduce this time[80]. Fermenting the seed for a few days in its own pulp may also speed up the germination process[K]. Another possibility is to harvest the seed 'green' (as soon as the embryo has fully developed but before the seedcoat hardens) and sow it immediately in a cold frame. If timed well, it can germinate in the spring[80]. If you are only growing small quantities of plants, it is best to pot up the seedlings as soon as they are large enough to handle and grow them on in individual pots for their first year, planting them out in late spring into nursery beds or their final positions. When growing larger quantities, it might be best to sow them directly outdoors in a seedbed, but with protection from mice and other seed-eating creatures. Grow them on in the seedbed until large enough to plant out, but undercut the roots if they are to be left undisturbed for more

nwatta A very easily grown plant, it prefers a welldrained moisture retentive loamy soil but is not at all fussy[11, 200]. Once established, it succeeds in excessively moist soils and also tolerates drought[200]. It grows well on

a chalk soil and also in heavy clay soils[200]. A position in full sun is best when plants are being grown for their fruit, they also succeed in semi-shade though fruit yields and guality will be lower in such a position[11, 200]. Most members of this genus succeed in exposed positions, they also tolerate atmospheric pollution[200]. This species is not hardy in all parts of Britain, it usually succeeds outdoors for a number of years at Kew, but is killed in severe winters there[11]. It does not seem to fruit well in Britain[11]. The flowers have a foetid smell somewhat like decaying fish. This attracts midges which are the main means of fertilization. When freshly open, the flowers have more pleasant scent with balsamic undertones[245]. Hybridizes freely with other members of this genus[200]. Seedling trees take from 5 - 8 years before they start bearing fruit, though grafted trees will often flower heavily in their third year[K]. Seedlings should not be left in a seedbed for more than 2 years without being trans-

### 7.2.336 Pyrus persica

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Pyrus persica is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is about 3cm in diameter[200].

nrakta S. Europe to W. Asia. ksacta Not known in a truly wild situation[11]

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn, it will then usually germinate in mid to late winter. Stored seed requires 8 - 10 weeks cold stratification at 1°c and should be sown as early in the year as possible[200]. Temperatures over 15 - 20°c induce a secondary dormancy in the seed[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for their first year. Plant them out in late spring or early summer of the following year.

nwatta Prefers a good well-drained loam in full sun[200]. Grows well in heavy clay soils. Tolerates light shade but does not fruit so well in such a position. Tolerates atmospheric pollution, excessive moisture and a range of soil types if they are moderately fertile[200]. Established plants are drought tolerant[200]. Plants are hardy to about -15°c[200]. This species is closely related to P. amygdaliformis[11].

### 7.2.337 Vitis davidii

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Vitis davidii is a deciduous Climber growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or dried for winter use[1, 61]. A harsh flavour[22, 183]. A pleasant flavour according to other reports[11, 200]. Small but sweet[182]. The fruit is about 16mm in diameter[200]. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour[55]. Young tendrils - raw or cooked[55, 85].

nrakta E. Asia - China ksacta Forests, thickets, banks of 7.2.295 Passiflora x colvillii streams and foothills at elevations of 500 - 1300 metres[109,

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame

nwatta Landscape Uses:Pest tolerant, Standard, Specimen. Prefers a woodland soil but thrives in a warm open welldrained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It succeeds on a wall at Kew and outdoors in milder areas[11]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species has been cultivated for many centuries in China for the oil in its seed[109, 219]. A very ornamental plant, some named forms have been developed for their ornamental value. This species is closely related to C. sasangua[11]. Special Features: Not North American native, Attractive flowers or blooms

### 7.2.294 Polygonatum stenanthum

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 1.2 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Polygonatum stenanthum is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista Although no reports of toxicity have been seen for this species, some members of this genus have poisonous fruits and seeds.

kcakta Edible Parts: Leaves RootEdible Uses: Young shoots - cooked[105, 177]. They can be used as an asparagus substitute. Root - cooked[105, 177]. Rich in starch.

nrakta E. Asia - Japan, ksacta Mountains and woods all over Japan[58].

propta Seed - best sown as soon as it is ripe in early autumn in a shady part of a cold greenhouse[200]. Sow stored seed as early in the year as possible. Germination can be slow, they may not come true to type[200] and it takes a few years for them to reach a good size. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in March or October. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a fertile humus rich moisture-retentive well-drained soil in cool shade or semi-shade[200] Plants are intolerant of heat and drought but they tolerate most other conditions[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. The young shoots of most members of this genus are very attractive to slugs. Hybridizes with other members of this genus[200].

Passion Flower

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc

htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Passiflora x colvillii is an evergreen Climber growing to 10 m (32ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Fruit - raw or cooked[262].

nrakta A hybrid of garden origin, P. incarnata x P. caerulea, ksacta Not known in a wild situation

propta Pre-soak the seed for 12 hours in warm water and then sow late winter or early spring in a warm greenhouse. If sown in January and grown on fast it can flower and fruit in its first year[88]. The seed germinates in 1 - 12 months at 20°c. Prick out the seedlings into individual pots when they are large enough to handle. It you are intending to grow the plants outdoors, it is probably best to keep them in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Mulch the roots well in late autumn to protect them from the cold. This species is a hybrid and, as such, will not breed true from seed. Cuttings of young shoots, 15cm with a heel, in spring[1]. Leaf bud cuttings in spring. Cuttings of fully mature wood in early summer. Takes 3 months. High percentage[3].

nwatta Requires a well-drained soil with plenty of moisture in the growing season, otherwise it is not fussy[1, 200]. Dislikes highly alkaline soils[202]. Hardy to about -15°c, if plants are cut down to the ground by frost they can regenerate from the base[200]. It is best to apply a good mulch to the roots each winter in order to protect them from the cold[262]. Very fast growing[11]. Roots of outdoor grown plants should be restricted to encourage fruiting[1]. Plants produce tendrils and climb by attaching these to other plants. If fruit is required, especially when the plant is grown indoors, it is best to hand pollinate using pollen from a flower that has been open for 12 hours to pollinate a newly opened flower before midday[88, 200]. The flowers open in sunny weather and do not open on dull cloudy days[219]. Plants are very tolerant of pruning and can be cut back to ground level if required to rejuvenate the plant[202]. Any pruning is best carried out in the spring[219]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.296 Duchesnea filipendula

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli fvifxre7t hionli

drutta Duchesnea filipendula is a PERENNIAL growing to 0.1 m (0ft 4in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[61, 177]. The fruit has the appearance and texture of a strawberry but very little flavour[K].

nrakta E. Asia - China, ksacta Not known

propta Seed - sow spring in a sunny position in a greenhouse. Germination usually takes place within 1 - 6 weeks or more at 15°c. A period of cold stratification may speed up germination. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division of runners in spring or late summer. Very easy, they can be planted out straight into their permanent

nwatta We have very little information on this species and do not know if it will be hardy in Britain. Judging by other members of this genus it probably prefers a moist but welldrained soil in a sunny position and grows well in a rock garden. This species is cultivated for its edible fruit in China[61].

#### 7.2.297 Berberis calliantha

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.7 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis calliantha is an evergreen Shrub growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy). medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[K]. An acid flavour[K].

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine [218]. Berberine has also shown antitumour activity[218].

nrakta E. Asia - S.E. Tibet. ksacta Montane regions.

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Roots in 4 - 8 weeks[113]. Pot up in spring[113]. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils and in full sun[11, 200]. Grows well in heavy clay soils. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely and resprout well from the base[200].

#### **7.2.298** Ulmus alata

Winged Elm

6 tlin 9 cvuc 2 kcak 0 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ulmus alata is a deciduous Tree growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in May, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked.

tcanta String WoodThe inner bark is very fibrous and can be used as a string[46, 61, 82, 149]. Wood - closegrained, heavy, hard, not strong, brittle, difficult to split. It weighs about 46lb per cubic foot, is not considered to be as

strong as other elms, but is used for tool handles, wheel hubs etc[46, 61, 82, 149, 227, 229].

nrakta Eastern and Central N. America - Virginia to Florida, west to Illinois, Missouri and Texas. ksacta Dry gravelly uplands, less often in alluvial soils on the borders of swamps and banks of streams, occasionally in inundated swamps[82].

propta Seed - if sown in a cold frame as soon as it is ripe, it usually germinates within a few days[200]. Stored seed does not germinate so well and should be sown in early spring[200]. The seed can also be harvested 'green' (when it has fully developed but before it dries on the tree) and sown immediately in a cold frame. It should germinate very guickly and will produce a larger plant by the end of the growing season[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Plants should not be allowed to grow for more than two years in a nursery bed since they form a tap root and will then move badly. Layering of suckers or coppiced shoots[200].

nwatta Landscape Uses:Specimen, Street tree. Prefers a fertile soil in full sun[188], but can be grown in any soil of at least moderate quality so long as it is well drained[1]. A fastgrowing tree in its native range[227], but this species does not thrive in Britain[1]. Closely related to U. thomasii[11]. Susceptible to 'Dutch elm disease', a disease that has destroyed the greater part of all the elm trees growing in Britain. The disease is spread by means of beetles. Mature trees killed back by the disease will often regrow from suckers, but these too will succumb when they get larger. There is no effective cure (1992) for the problem, but most E. Asian, though not Himalayan, species are resistant (though not immune) to the disease so the potential exists to use these resistant species to develop new resistant hybrids with the native species[200]. The various species of this genus hybridize freely with each other and pollen is easily saved, so even those species with different flowering times can be hybridized[200]. Special Features: Attracts birds. North American native, Inconspicuous flowers or blooms.

### 7.2.299 Cardamine lyrata

6 tlin 9 cvuc 2 kcak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fvifxre7t hionli

drutta Cardamine lyrata is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves raw or cooked[105, 177]. Root - raw or cooked[105, 177].

nrakta E. Asia - China, Japan, Korea, Siberia. ksacta Wet places and paddy fields in lowland and foothills, C. and S.

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the

nwatta Succeeds in most soils[1]. Prefers a moist humus rich soil in shade or semi-shade[200]. A stoloniferous species[200].

The stems are a pungent, bitter, warm herb that dilates the 9, 21, 165]. They are often used for their healing effect bronchial vessels whilst stimulating the heart and central nervous system[238]. The stems are also diaphoretic. diuretic and vasodilator[4, 61, 165, 238]. They are used internally in the treatment of asthma, hay fever and allergic complaints[238]. They are also combined with a number of other herbs and used in treating a wide range of complaints 238]. This herb should be used with great caution, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed to patients who are taking monoamine oxidase inhibitors, or suffering from high blood pressure, hyperthyroidism or glaucoma[238]. Ephedrine is seen as a performance-boosting herb and, as such, is a forbidden substance in many sporting events such as athletics[K]. The stems are used in Tibetan medicine, where they are considered to have a bitter taste and a cooling potency[241]. Febrifuge, tonic and vulnerary, they are used in the treatment of severe bleeding and chronic fevers[241]. A decoction of the stems and roots is used in Russia to treat rheumatism and syphilis[243]. The stems can be harvested at any time of the year and are dried for later use[238]. The juice of the berries is used to treat respiratory affections[243].

nrakta E. Asia - S.W. China to the Himalayas. ksacta Stony slopes and gravel terraces in drier areas of the Himalayas at 2400 - 5000 metres from Afghanistan to Bhutan[51].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. Plants are hardy to about 15°c[200]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.333 Pulmonaria officinalis

Lungwort, Common lungwort, Jerusalem Sage, Jerusalem Cowslip

6 tlin 9 cyuc 2 kcak 0 tcan 3 dwat 0.3 m hkuc

pcimhmim cyutli hgattcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pulmonaria officinalis is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from March to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 7, 8, 9, 105]. They can be added to salads or used as a potherb[183]. A fairly bland flavour but the leaves are low in fibre and make an acceptable addition to mixed salads, though their mucilaginous and slightly hairy texture make them less acceptable when eaten on their own[K]. The young leaves make a palatable cooked vegetable[244], though we have found the texture to be somewhat slimy[K]. The plant is an ingredient of the drink Vermouth[244].

tcanta A tolerant and slow growing ground cover plant for open woodland and border edges[197, 200]. Plants should be spaced about 50cm apart each way[208].

dwatta Astringent Demulcent Diaphoretic Diuretic Emollient Expectorant Homeopathy Ophthalmic ResolventLungwort has a high mucilage content and this makes it useful in the treatment of chest conditions, being of particular benefit in cases of chronic bronchitis[254]. It combines well with other herbs such as coltsfoot (Tussilago farfara) in the treatment of chronic coughs including whooping cough and can also be taken to treat asthma[254]. The leaves and flowering shoots are astringent, demulcent, diaphoretic, diuretic, emollient, mildly expectorant and resolvent[4, 7, in pulmonary complaints[4] and their mucilaginous nature makes them beneficial in treating sore throats[244]. The leaves can also be used externally to stop bleeding[254]. They are harvested in the spring and dried for later use[7]. A distilled water made from the plant is an effective eyewash for tired eyes[7]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of bronchitis, coughs and diarrhoea[9].

nrakta Europe. Naturalized in Britain. ksacta Moist grasslands, damp woods and hedgerows in Britain, avoiding acid soils[13, 17, 244]. Usually found on limestone[200].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn or after flowering in early summer if the soil is not too dry[200]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Specimen, Woodland garden, Grows well in any moderately good soil including heavy clay soils[1, 31]. Prefers full to part shade in a moist humus rich soil[200]. Succeeds in the sunless shade of buildings[200]. Plants growing in shady positions tolerate drought if the soil is rich in humus[190]. The leaves tend to wilt in hot weather when the plant is grown in full sun[190]. Hardy to about -20°c[187]. Members of this genus are rarely if ever troubled by browsing deer and rabbits[233]. A valuable early nectar source for bees[200]. There are several named forms. selected for their ornamental value[233]. Hybridizes freely with other members of this genus[200]. Special Features: Not North American native. Extended bloom season in Zones 9A and above.

### 7.2.334 Arisarum vulgare

Friar's Cowl

6 tlin 9 cvuc 2 kcak 0 tcan 0 dwat 0.5 m hkuc

pcimhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Arisarum vulgare is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from October to July, in flower in May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist

pcista The plant contains calcium oxylate crystals. These cause an extremely unpleasant sensation similar to needles being stuck into the mouth and tongue if they are eaten but they are easily neutralized by thoroughly drying or cooking the plant or by steeping it in water[65].

kcakta Edible Parts: Leaves RootEdible Uses: Root cooked. The acrid juice should first be removed by thorough and repeated washing leaving behind a nutritious and innoxious residue[2, 105, 177]. Thorough drying or cooking will also destroy any harmful elements of this root[K]. The root is frequently used as an emergency food in times of scarcity, it is about the size of a walnut[2]. One report suggests that the leaves might be edible[177]. If they are they must be well cooked first[K]

tcanta A good ground-cover plant for a shady place[1]. nrakta S. Europe. ksacta Grassy places, open ground[45] and rocky ground[90].

propta Seed - we have no details for this species but suggest sowing the seed in a shady part of the greenhouse as soon as it is ripe in the spring if this is possible. Sow stored seed in early spring. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least the first winter in a greenhouse and plant out when dormant in the summer once the tuber has reached a reasonable size. Division in spring after the plant dies down[1].

in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Manna SeedEdible Uses: Condiment GumSeed - ground into a powder and used with cereal flours in making cakes and breads[177, 183]. An oleo-resin obtained from the leaves and stems is eaten raw or used as a commercial food flavouring in baked goods, ice cream, chewing gum etc[2, 105, 177, 183, 238]. The plant is said to yield a sweet manna[183].This report is probably referring to the oleo-resin mentioned above[K].

tcanta Gum ResinThe glandular hairs on the leaves yield the oleo-resin 'ladanum', used medicinally and in soaps, perfumery, fumigation etc[4, 11, 46, 61, 64, 89, 100]. This resin is an acceptable substitute for ambergris (which is obtained from the sperm whale) and so is important in perfume manufacture[238]. The resin is collected by dragging a type of rake through the plant, the resin adhering to the teeth of the rake, or by boiling the twigs and skimming off the resin[64, 89]. Most resin is produced at the hottest time of the year[46].

dwatta Antibiotic Emmenagogue Expectorant StimulantLabdanum is an aromatic, expectorant, stimulant herb that controls bleeding and has antibiotic effects[4, 238]. It is used internally in the treatment of catarrh and diarrhoea[238] and as an emmenagogue[4]. The leaves are harvested in late spring and early summer and can be dried for later use, or the resin extracted from them[238].

nrakta Europe - W. Mediterranean. ksacta Pine woods, copses and on dry usually granitic hills[89, 184].

propta Seed - gather when ripe and store dry[78]. Surface sow in late winter in a greenhouse[164]. The seed usually germinates in 1 - 4 weeks at  $20^{\circ}$ c[164]. Prick out the seedlings as soon as they are large enough to handle into individual pots. Grow them on in the greenhouse for their first winter and plant them out the in the following spring or early summer, after the last expected frosts[164]. The seed stores for at least 3 years[K]. Cuttings of softish to half-ripe wood, 8cm long with a heel or at a node, June/August in a frame. Roots are formed within 3 weeks[78]. High percentage[78]. Cuttings of almost mature wood, 8 - 12cm with a heel or at a node, September/October in a frame. High percentage[78]. Lift and pot up in the spring, plant out when a good root system has formed[78]. Layering in spring.

nwatta Industrial Crop: Hydrocarbon Management: Coppice Regional CropRequires a sunny position in a welldrained light sandy soil[11, 182], growing well in poor soils[238]. Withstands drought once it is established[11, 190]. Plants are fairly wind resistant [166, K], tolerating maritime exposure[188]. Resents root disturbance[11]. Plants are hardy to about -10c[184], but they require protection in severe winters[11]. Plants are somewhat hardier when grown in poor soils[182]. Individual flowers only last one day but there is a long succession of them[11, 200]. Labdanum dislikes pruning, especially as it gets older and so any formative work should be restricted to removing dead, straggly or damaged growths[238]. The plant also resents root disturbance[200]. Plants should be pot grown and then planted out in their final positions whilst still small. Sometimes cultivated for its gum, which is known as 'Labdanum', this is exuded in such quantity in hot weather that the plant becomes very sticky[4, 61]. The leaves have glandular hairs which produce an aromatic gum. The sweet balsamic smell is most apparent in the summer in the early morning[245]. A very ornamental plant, it is very free-flowering and fast growing [49]. There are a number of named forms developed for their ornamental value[182]. An excellent nurse plant for sheltering young seedlings[49]. This species is notably resistant to honey fungus[88, 200]. The flowers are very attractive to bees[108]. Hybridizes freely with other members of this genus[200].

#### 7.2.331 Schisandra repanda

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 6 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Schisandra repanda is a deciduous Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: TeaFruit - raw or cooked[105, 183]. Used in preserves or to make a tea[177, 183]

nrakta E. Asia - Japan, Korea. ksacta Woods all over Japan[58].

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Plants are intolerant of drought[K]. This species has not been properly evaluated for hardiness in Britain but it will probably succeed outdoors in most parts of the country[11], especially if given the protection of a woodland or a wall[K]. The young growth in spring can be damaged by late frosts. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.332 Ephedra gerardiana

Ma Huang, Gerard jointfir 6 tlin 9 cyuc 2 kcak 0 tcan 4 dwat 0.6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ephedra gerardiana is an evergreen Shrub growing to 0.6 m (2ft) by 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 146]. A sweet flavour[158]. The fruit is about 7mm in diameter[200].

tcanta FuelThe wood is very close grained[158]. Too small for commercial exploitation, though it is used locally for fuel[146]. A good ground cover plant for dry soils[188]. Plants should be spaced about 60cm apart each way[208].

dwatta Antiasthmatic Antirheumatic Cardiofonic Diaporetic Diuretic Febrifuge Tonic Vasodilator VD VulneraryMembers of this genus contain various medicinally active alkaloids (but notably ephedrine) and they are widely used in preparations for the treatment of asthma and catarrh[238]. Ephedrine acts promptly to reduce swellings of the mucous membranes and has antispasmodic properties, thus making it valuable in the treatment of asthma[4]. This species concins between 0.28 and 2.79 alkaloids[240]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. The plant also has antiviral effects, particularly against influenza[238].

### 7.2.300 Aquilegia shockleyi

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aquilegia shockleyi is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no records of toxicity have been seen for this species, it belongs to a family that contains a number of mildly toxic species. It is therefore wise to exercise some caution. The flowers are probably perfectly safe to eat.

kcakta Edible Parts: FlowersEdible Uses: Flowers - raw. Rich in nectar, they are sweet and delightful[172], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching munch in the garden[K].

tcanta Parasiticide Parasiticide The seed is used as a parasiticide to rid the hair of lice[172].

dwatta Antispasmodic Diaphoretic Parasiticide Parasiticide Resolvent SalveAntispasmodic, diaphoretic, parasiticide, resolvent, salve[172].

nrakta South-western N. America - California and Nevada. ksacta Moist places in dry woodlands and shrublands at elevations of 1200 - 2700 metres[270].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. Most species are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 7.2.301 Cudrania tricuspidata

Silkworm Thorn, Storehousebush 6 tlin 9 cyuc 2 kcak 2 tcan 2 dwat 6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Cudrania tricuspidata is a deciduous Tree growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - fresh or preserved[1, 22, 61]. Somewhat like a mul-berry[183]. The firm fruit is relatively tasteless, when soft-ripe it is sub-acid to sweet and some forms can be quite delicious[46, 105, 109, 151, 183]. It contains lots of large seeds[151]. The fruit is about 25mm in diameter[200]. Leaves - a famine food[179].

tcanta Dye Fibre WoodA yellow dye is obtained from the wood[178]. The bark fibers are used for making paper[266]. Wood - finely grained. Used for utensils[178].

dwatta Antiperiodic Galactogogue Malaria Ophthalmic Women's complaintsAn infusion of the wood is used to treat sore or weak eyes[178, 218]. The inner bark and the wood are used in the treatment of malaria, debility and menor-rhagia[178, 218]. The root is galactogogue and is also used in the treatment of amenorrhoea[218]. The plant is used to

eliminate blood stasis and stimulate the circulation in cancer of the alimentary system, blood and lungs[218].

nrakta E. Asia - China, Japan and Korea. ksacta Rocky slopes and roadsides in W. China[109]. Sunny forest margins and mountain slopes at elevations of 500 - 2200 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[188]. Sow stored seed in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[18, K]. Cuttings of mature wood, November in a sandy soil in a frame[1].

nwatta Prefers a warm well-drained fertile loam[1, 188]. Requires a sunny position[188]. A very hardy plant[1]. The leaves are a food source for silk-worms[1, 11]. Probably only the male tree is in cultivation in Britain, though at least one selected female form is being grown in N. America[183]. Both male and female plants normally need to be grown if fruit or seed is required but male trees occasionally produce a few small fruits[183]. The plant is heat tolerant in zones 9 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the aboveground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. A sprouting standard sending up shoots from the base [1-2]

### 7.2.302 Ophrys fusca

Brown Bee Orchid

6 tlin 9 cvuc 2 kcak 0 tcan 2 dwat 0.4 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ophrys fusca is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Üses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe - Mediterranean. ksacta Rocky, grassy and bushy places.

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200].

It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants are best grown in the shade[188]. Orchids are, in general, shallowrooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 7.2.303 Lithocarpus densiflorus

Tanbark Oak

 $6 \ {\rm lin} \ 9 \ {\rm cyuc} \ 2 \ {\rm kcak} \ 0 \ {\rm tcan} \ 1 \ {\rm dwat} \ 10 \ {\rm m} \ {\rm hkuc}$ hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Lithocarpus densiflorus is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed -cooked[94, 95]. The seed was a staple food for several native North American Indian tribes[257]. It contains bitter-tasting tannins and there are various ways of removing them. The fastest is by soaking the ground-up seed in hot water - if the water is changed at least once the tannins should be removed within 12 hours. Traditionally, the seeds were placed in a cloth bag and either buried in swampy ground or suspended in a running stream for a few months. Once the tannins have been removed, the seed is then dried, ground into a powder and can be used as a porridge or can be mixed with cereal flours in baking bread etc[183, 257]. It has a pleasant taste after it has been leached[161]. The seed is up to 25mm long and wide[82, 229]. The seed is valued for its oil[161].

tcanta Dye Fuel Oil Preservative Tannin WoodThe bark is exceedingly rich in tannin, yielding up to 29%[11, 82, 123, 171]. It has been used as a brown dye and also to preserve rope that is being used in water[257, K]. Wood - hard, strong, close grained, brittle. It is not commercially important and is used mainly for fuel[82, 229].

dwatta Astringent Odontalgic SkinThe bark is very astringent. An infusion is used as a wash for face sores[257].

The infusion can also be held in the mouth to tighten loose teeth[257].

nrakta South-western N. America - Oregon and California. ksacta Woody slopes below 1500 metres[71] on fertile mountain slopes[229]. It is found on a variety of soil types, but requires a humid atmosphere if it is to thrive[82, 229].

propta The seed is best sown as soon as it is ripe in the autumn in a cold frame[200]. It needs to be protected from mice, squirrels and other seed eaters. The seed has a short viability but can be stored for a few months if kept cool and slightly damp - the salad compartment of a fridge is a good storage place. Germination takes place in the winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots. If the plants are 15cm or more tall by the summer they can be planted out into their permanent positions. Give them a good weed-excluding mulch and some protection from the cold for their first couple of years outdoors. If growth is not sufficient then grow them on in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Prefers a deep fertile soil with medium drainage[200]. Perfectly hardy at Kew[11], trees produced seed at Kew in the very hot summer of 1989[K]. A slow-growing tree in the wild, living up to 300 - 350 years old[229]. Plants usually flower in the spring and sometimes again in the autumn[188]. The seeds take two seasons to ripen[229]. Prolific crops are usually produced every other year in the wild[229].

### 7.2.304 Aciphylla colensoi

Wild Spaniard

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.9 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Aciphylla colensoi is an evergreen Perennial growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: GumRoot - cooked. Aromatic[173]. The plant yields a resin that is used as a chewing gum[173]. Shoots[173]. No further details.

nrakta New Zealand. ksacta Montane to sub-alpine altitudes in North and South Islands between latitudes 38 and 43° 30′ south[44].

propta Seed - best sown in a greenhouse as soon as it is ripe[200]. Stored seed should be sown in a greenhouse in late winter or early spring. Germination can be very slow. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter before planting them out in late spring or early summer, after the last expected frosts.

nwatta Requires a perfectly drained gritty soil in full sun[233]. Prefers a climate with rather damp air[233]. Plants are hardy to about -10°c and are succeeding outdoors in a mild garden in N. Ireland[233]. Dioecious. Female plants sometimes have a few male flowers but usually male and female plants must be grown if seed is required[200].

### 7.2.305 Castanopsis cuspidata

Japanese Chinquapin 6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 25 m hkuc hmim cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli

drutta Castanopsis cuspidata is an evergreen Tree growing to 25 m (82ft) by 10 m (32ft). See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, midges. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral

attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves Root SeedpodEdible Uses: Root - cooked. Boiled and eaten like parsnip[183]. Young shoots - raw or cooked. Added to salads or boiled as a potherb[183]. They are usually blanched before use[183]. A mucilaginous texture. The young pod-like fruits can be eaten when cooked[183].

dwatta PoulticeThe plant has been used in the treatment of colds[257]. A poultice of the roots or the leaves has been used in the treatment of sores and swellings[257].

nrakta North-western N. America. ksacta Dry open soils, meadows and roadsides[204].

propta Seed - sow in situ from late spring to early summer.

nwatta Prefers a dryish well-drained sandy loam and full sun. Heavy clay soils may induce winter rots. Succeeds on poor soils. The flowers open in the evening, they are richly scented and are very attractive to moths. The seeds are a good food source for birds, especially finches. Plants usually mutate freely. This species is very closely related to, and perhaps no more than a part of, O. biennis[204]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 7.2.327 Digitaria sanguinalis

Crab Grass, Hairy crabgrass

6 tlin 9 cyuc 2 kcak 2 tcan 1 dwat 0.5 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Digitaria sanguinalis is a ANNUAL growing to 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista There is a report that the leaves might be cyanogenic[218].

kcakta Edible Parts: SeedEdible Uses: Seed - ground up and used as a flour[2, 57, 105]. It has excellent keeping qualities[74] and makes a fine white flour that can be used for semolina[74, 115].

tcanta Fodder PaperA fibre obtained from the plant is used in making paper[74]. Animals: Fodder/animal feed, For-

dwatta Emetic Ophthalmic VDA decoction of the plant is used in the treatment of gonorrhoea[218]. A folk remedy for cataracts and debility, it is also said to be emetic[178, 218].

nrakta Cosmopolitan. A rare casual in Britain[17]. ks-acta Arable ground and waste places in Britain[17].

propta Seed - best sown in situ in the spring[162]. Only just cover the seed.

nwatta Prefers a sandy soil[50]. Requires a warm sheltered position[162]. This species is occasionally cultivated, especially in Poland, for its edible seed. Special Features: Invasive.

#### 7.2.328 Lycoris squamigera

Resurrection Lily, Hardy Amaryllis, Magic Lily, Autumn Lycoris, Naked Lady

6 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.7 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lycoris squamigera is a BULB growing to 0.7 m (2ft 4in) by 0.2 m (0ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The bulb contains toxins and must be leached before it is used for food[105].

kcakta Edible Parts: RootEdible Uses: Bulb - cooked. It is used as a source of starch[105, 177]. The bulb is 4cm in diameter[200]. Caution is advised, see the notes above on toxicity.

nrakta E. Asia - Japan. ksacta Edges of cultivated fields[200].

propta The seed is best sown as soon as it is ripe in a greenhouse and should germinate in the spring[200]. Sow the seed thinly so that it does not need to be disturbed for its first year of growth. Give an occasional liquid feed during the growing season to ensure the plants do not become nutrient deficient. Pot up the small bulbs when the plants become dormant, placing 2 bulbs in each pot. Grow them on for another 2 years in the greenhouse before planting them out when they are dormant. Division of offsets in the dormant season[200].

nwatta Landscape Uses:Border, Container, Foundation. Massing, Rock garden, Seashore, Specimen, Requires a deep well-drained sandy soil rich in organic matter in full sun[200]. The bulb should be planted quite shallowly so that it can ripen well after flowering[245]. Hardy to at least -15°c, the leaves are produced in early spring and persist until late summer[200]. Plants need a warm period in late summer in order to ripen the bulbs and induce flowering in the following year [188]. A very ornamental species, each bulb producing a number of flowering stems in mid to late summer[245]. The flowers are very sweetly scented, the scent pervading the whole garden[245]. Plants are attractive to slugs and need to be protected from them[200]. Very sensitive to root disturbance, the bulbs can take some years to become well established[200]. Special Features:Not North American native, Naturalizing, Suitable for cut flowers, Fragrant flowers, Attractive flowers or blooms.

### 7.2.329 Duchesnea chrysantha

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Duchesnea chrysantha is a PERENNIAL growing to  $0.1\,\mathrm{m}$  (0ft 4in) by  $1\,\mathrm{m}$  (3ft 3in). See above for USDA hardness. It is hardy to UK zone 7. It is in flower from May to October, and the seeds ripen from July to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[105]. The fruit is about 10mm in diameter[200] with the appearance and texture of a strawberry but very little flavour[K]. Leaves and young plant - cooked[105].

nrakta E. Asia - China, Japan, Korea, Manchuria. ksacta Sunny grassy places in lowland all over Japan[58]

propta Seed - sow spring in a sunny position in a greenhouse. Germination usually takes place within 1 - 6 weeks or more at 15°c. A period of cold stratification may speed up germination. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division of runners in spring or late summer. Very easy, they can be planted out straight into their permanent positions.

nwatta Prefers a moist but well-drained soil in a sunny position[175]. Grows well in a rock garden[1]. This species is hardy to about -15°c. Plants can be invasive, spreading freely by means of runners[187]. This species is sometimes considered to be no more than a form of D. indica[74].

### 7.2.330 Cistus ladanifer

Labdanum, Common gum cistus

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 1.5 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Cistus ladanifer is an evergreen Shrub growing to 1.5 m (5ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year,

active ingredient than P. peltatum[211]. The roots contain several important anti-cancer lignans, including podophyllin and berberine[218]. The roots are also antirheumatic[218]. The root is harvested in the autumn and either dried for later use or the resin is extracted[238]. This plant is highly poisonous and should only be used under the supervision of a qualified practitioner[238]. It should not be prescribed for pregnant women[238].

nrakta E. Asia - China, ksacta Deciduous and mixed forests, often in wet areas beneath Rhododendrons and conifers, at 2.750 - 3350 metres. Also open stony alpine pastures amongst dwarf scrub at 3350 - 3950 metres.

propta Seed - best sown as soon as it is ripe in a cold frame. Sow stored seed in a cold frame in early spring. The seed germinates in 1 - 4 months at 15°c. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse for at least 2 growing seasons. Plant them out into their permanent positions in the winter when the plants are dormant. Division in March/April[111].

nwatta Prefers a moist peaty soil and filtered light or shade[4, 111]. Grows well in a moist open woodland[28, 31] and also succeeds under beech trees in a deep moist leafy soil[130]. Plants are fairly hardy, but the new growth in spring is frost tender[233]. Plants in this genus have excited quite a lot of interest for the compounds found in their roots which have been shown to have anti-cancer activity[124]. There are various research projects under way (as of 1990)[124]. This species is closely related to P. hexandrum[200]. he plant takes some years to become established[124] but is very long lived in a suitable habitat[130].

### 7.2.324 Codonopsis ussuriensis

6 tlin 9 cvuc 2 kcak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasilut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Codonopsis ussuriensis is a PERENNIAL growing to 0.3 m (1ft) by 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to October, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[46, 61, 105]. Plants produce a stout, globose tuber[275]. The ones we grew were quite thin, but they have a reasonable flavour with a slight sweetness[K].

nrakta E. Asia - China, Japan. ksacta Woods in lowland and mountain areas[58], especially on sandy soils[74]. In more or less wet, sunny meadows at low elevations in Japan[275].

propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to cause the least possible disturbance to the plants and to avoid having to dig up the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the fol-

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. Only succeeds in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]l. Dormant plants are hardy to about -20°c[187]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This plant is considered to be a part of C. lanceolata by many botanists[200]. Plants resent root disturbance and should be

planted out into their permanent position as soon as possible[164]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also eaten[K].

### 7.2.325 Petasites palmatus

Sweet Butterbur, Golden Palms Coltsfoot, Sweet Coltsfoot,

6 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.4 m hkuc

pcimhmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhien hionli

drutta Petasites palmatus is a PERENNIAL growing to 0.4 m (1ft 4in) by 1 m (3ft 3in) at a fast rate. It is in flower from February to April, and the seeds ripen in April. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Flowers StemEdible Uses: SaltYoung flower stalks, used before the flower buds appear, are boiled until tender and seasoned with salt[172, 177, 183]. Flower buds - cooked[183]. Leafstalks - peeled and eaten raw[105, 177, 183, 257]. The ash of the plant is used as a salt substitute[46, 61, 95, 102, 183]. To prepare the salt, the stems and leaves are rolled up into balls whilst still green, and after being carefully dried they are placed on top of a very small fire on a rock and burned[213].

dwatta Pectoral Salve TBThe roots have been used in treating the first stages of grippe and consumption[257]. The dried and grated roots have been applied as a dressing on boils, swellings and running sores[257]. An infusion of the crushed roots has been used as a wash for sore eyes[257]. A syrup for treating coughs and lung complaints has been made from the roots of this species combined with mullein(Verbascum sp.) and plum root (Prunus sp.)[257].

nrakta N. America - Newfoundland to Massachusetts, west to Alaska and south to California, ksacta Low woods. glades and damp clearings[43]. Swamps and along the sides of streams[235].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe or in early spring. Only just cover the seed and do not allow the compost to dry out. When they are large enough to handle. prick the seedlings out into individual pots and plant them out in the summer. Division succeeds at almost any time of the year. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Landscape Uses:Seashore, Woodland garden. Succeeds in ordinary garden soil[1], but prefers a deep fertile humus-rich soil that is permanently moist but not stagnant, succeeding in shade, semi-shade or full sun[200]. Requires a moist shady position[187]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Plants are hardy to about -20°c[187]. A very invasive plant, too rampant for anything other than the wild garden[187, 200]. Dioecious, male and female plants must be grown if seed is required. Special Features: Attractive foliage. North American native, Invasive, Wetlands plant,

### 7.2.326 Oenothera elata hookeri

Hooker's Evening Primrose 6 tlin 9 cyuc 2 kcak 2 tcan 1 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Oenothera elata hookeri is a BIEN-NIAL/PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies), bees. The plant is self-fertile. It is noted for

soils. It can grow in semi-shade (light woodland). It prefers rocks[100], usually on calcareous soils[7].

kcakta Edible Parts: SeedEdible Uses: Seed - cooked[2, 46, 63, 105, 177]. The cotyledon of the nut is eaten boiled or roasted[183].

nrakta E. Asia - China, Japan. ksacta Woods and ravines, especially near the sea in western China[109].

propta Seed - requires a period of cold stratification and is best sown as soon as it is ripe in a cold frame[138]. The seed has a short viability and should not be allowed to dry out. It can be stored for a few months if kept cool and moist (putting it in a plastic bag that is placed in the salad compartment of a fridge works well). Stored seed should be soaked in warm water for 24 - 48 hours prior to sowing [138]. Germination usually takes place within 1 - 3 months at 15°c[138]. As soon as they are large enough to handle, prick out the seedlings into individual pots and plant them out in mid summer if possible, otherwise grow them on in a cold frame for their first winter and plant them out in late spring. Give the young plants some protection from cold for their first few winters outdoors.

nwatta Prefers a good deep medium to stiff loam[1]. Requires a sheltered position in semi-shade and a lime-free soil[138]. Although cold hardy in Britain, this species really requires a warm continental climate if it is to prosper and it does not do well in the maritime climate of this country[200]. It succeeds in the London area but does not attain its full size there[11]. It grows well in S.W. England[11]. The catkins have an unpleasant hawthorn-like smell to attract midges for their pollination[245].

### 7.2.306 Santolina chamaecyparissus

Cotton Lavender

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.6 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Santolina chamaecyparissus is an evergreen Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista The bruised leaves have been known to cause a severe rash on sensitive skins[182].

kcakta Edible Parts: Edible Uses: CondimentThe aromatic leaves are used as a flavouring for broths, sauces, grain dishes etc[15, 183].

tcanta Disinfectant Dve Essential Hedge Hedge Potpourri RepellentPlants can be grown as a low formal hedge and used as an edging plant[200]. The plant is very tolerant of shearing[200]. In less exposed areas the plants can be trimmed in the autumn, otherwise they need to be cut by early April if they are to be allowed to flower[245]. Plants can also be grown for ground cover[190]. They are best spaced about 60cm apart each way[208]. The leaves are strewn amongst clothes to repel moths etc[4, 15, 18, 20, 100]. The growing plant repels various insect pests, especially cabbage moths[201]. The dried leaves are used in pot-pourri[238]. An essential oil from the leaves is used in perfumery[4], the oil is also obtained from the flowers[168]

dwatta Antispasmodic Disinfectant Emmenagogue Stings VermifugeThe leaves and flowering tops are antispasmodic, disinfectant, emmenagogue, stimulant and vermifuge[4, 7, 11, 201]. Cotton lavender is rarely used medicinally[238], though it is sometimes used internally as a vermifuge for children and to treat poor digestion and menstrual problems[4, 238]. When finely ground and applied to insect stings or bites, the plant will immediately ease the pain[7]. Applied to surface wounds, it will hasten the healing process by encouraging the formation of scar tissue[7]. The leaves and flowering stems are harvested in the summer and dried for later use[238].

nrakta Europe - Mediterranean. Occasionally naturalized in Britain[17]. ksacta Dry ground, stony banks and

propta Seed - sow spring in a greenhouse. Does not require pre-treatment[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe side shoots, 5 - 8 cm long with a heel, July/August in a frame. Roots within 2 weeks. High percentage[78]. The heeled cuttings can also be placed direct into the open garden in early July and should be well-rooted by the winter[245]. Division in spring or autumn[111]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame. planting them out once they are well established in the sum-

nwatta Landscape Uses:Border, Foundation, Ground cover, Massing, Rock garden, Seashore. An easy and undemanding plant that does not require a rich soil, though it strongly dislikes wet conditions around the roots[1, 11, 15, 200]. Prefers a light sandy fairly poor soil on a sunny slope[200]. Prefers a chalky soil[190]. Established plants are drought tolerant[190]. They succeed in a hot dry position[190]. Hardy to about -15°c when in a well-drained soil. A very wind hardy plant, it succeeds on the top of Cornish drystone walls[49]. A very ornamental plant[1], there are several named varieties[245]. Cotton lavender tolerates shearing so long as this is not done at times of low resistance (winter?)[200]. Plants can be cut back hard in spring to maintain their form[200, 208], though this will prevent them flowering[208]. A good companion plant for roses[201]. Flowers are produced on two year old wood[182]. The leaves are very aromatic[190]. The bruised leaves are pleasantly pungent, though the flowers have an unpleasant smell[245]. The form S. chamaecyparissus nana has a more pungent aroma than the type[245]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage. Fragrant foliage, Not North American native, Suitable for dried

### 7.2.307 Aquilegia buergeriana

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Aguilegia buergeriana is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no records of toxicity have been seen for this species, it belongs to a family that contains a number of mildly toxic species. It is therefore wise to exercise some caution. The flowers are probably perfectly safe to eat.

kcakta Edible Parts: Flowers LeavesEdible Uses: Flowers - raw. Rich in nectar, they have a sweet taste[172, 183], they make a very attractive addition to mixed salads and can also be used as a thirst-quenching munch in the garden[K]. Leaves - cooked[177]. Some caution is advised - see the notes above on toxicity

tcanta ParasiticideThe seed is used as a parasiticide to rid the hair of lice[172].

nrakta E. Asia - C. and S. Japan. ksacta Not known

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be slow to germinate[200]. Stored seed can be sown in late winter in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter. Plant out in late spring or early summer. Division in spring[200].

nwatta Succeeds in ordinary garden soil, preferring a moist but not wet soil and a sunny position[1]. Intolerant of heavy clay[200]. Most species are short-lived, dying out after 2 - 3 years, though they usually produce seed prolifically[200]. However, they are very apt to hybridize with other members of the genus and so it becomes difficult to keep a species true to type if more than one is grown in the garden[200]. Plants seem to be immune to the predations of

rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

#### 7.2.308 Ephedra viridis

Mormon Tea, Brigham Tea, Long Leaf Ephedra, Mountain Joint Fir, Mormon Tea, Ephedra

6 tlin 11 cyuc 2 kcak 0 tcan 3 dwat 1.8 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ephedra viridis is an evergreen Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 9. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit SeedEdible Uses: TeaFruit - raw. A sweet flavour. Seed - cooked. A bitter flavour, it is roasted and ground into a powder and used to make a bread or mush[183]. A delicious tea is made by steeping the green or dried twigs in boiling water[183, 257]. The flavour is said to be improved if the stems are roasted first[183].

tcanta DyeThe twigs, boiled with alum, produce a light tan dye[257]

dwatta Blood purifier Diuretic Kidney Poultice Stomachic Tonic VDThis plant has a wide reputation as a cure for syphilis[216]. A strong decoction of the stems was drunk and a poultice of the pulverized or boiled stems applied to the sores[257]. The stems are blood purifier, diuretic and tonic[257]. An infusion has been used in the treatment of coughs and colds, anaemia, rheumatism, stomach ulcers and other disorders, kidney problems[257]. The dried, powdered stems are used as a dressing on sores and burns[257]. The stems of most members of this genus contain the alkaloid ephedrine and are valuable in the treatment of asthma and many other complaints of the respiratory system[K]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to sideeffects[254]. Ephedra does not cure asthma but in many cases it is very effective in treating the symptoms and thus making life somewhat easier for the sufferer. The stems can be used fresh or dried and are usually made into a tea, though they can also be eaten raw[K]. The young stems are best if eating them raw, though older stems can be used if a tea is made[K]. The stems can be harvested at any time of the year and are dried for later use[238].

nrakta South-western N. America - California to Colorado and Arizona. ksacta Dry rocky slopes, gravel terraces and canyon walls, often on limestone, at elevations of 800 - 2500 metres[270].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse [200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

mwatta Landscape Uses:Erosion control, Ground cover, Massing, Rock garden. Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. This species is not very hardy in Britain, it succeeds well in a cold greenhouse but is often killed outdoors by a combination of cold and wet conditions[200]. Dioecious, male and female plants must be grown if fruit and seed is required.Special Features: Attractive foliage. North American native.

### 7.2.309 Kadsura japonica

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 3.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli nyanhjen hjonli drutta Kadsura japonica is an evergreen Climber growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruit is up to 6mm long[219].

dwatta Antidiarrhoeal Stomachic TonicA decoction of the dried fruits is bechic, stomachic and tonic[218].

nrakta E. Asia - southern China, central and southern Japan. ksacta Climbs trees in woodlands[58]. Forests and slopes at elevaions of 500 - 2000 metres in Fujian and Taiwan Provinces, China[266].

propta Seed - best sown when it is ripe in the autumn in cold frame[200]. Prick out the seedlings into individual pats when they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in early summer and give some protection for their first winter outdoors. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Succeeds in any fertile garden soil[182]. Requires a sheltered position in a moderately fertile well-drained neutral to acid soil[200]. Prefers a position in semi-shade[219]. This species is not very hardy in Britain, though it succeeds when grown against a sunny wall in the milder areas of the country[182]. The flowers emit a soft sweet perfume[245]. Flowers are produced on the current year's growth[219]. Plants do not really require pruning[219]. Dioecious, male and female plants must be grown if fruit and seed is required[182].

### 7.2.310 Cyperus longus

Galingale

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 1.2 m hkuc

htut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Cyperus longus is an evergreen Perennial growing to 1.2 m (4ft) by 2 m (6ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: RootEdible Uses: CondimentTuber - used as a spice in soups, pies and sweets[5, 183].

tcanta Basketry Essential Paper WeavingThe leaves are used in basketry and for weaving hats, matting etc[100]. The root and stem have the scent of violets and are used in perfumery[4, 46, 61, 245]. The aroma becomes more pronounced when the root has been dried and left to age[245]. A fibre obtained from the plant is used in paper making[100].

dwatta Aromatic TonicThe root is an aromatic tonic[4]. It was at one time considered to be a good stomachic and useful in the first stages of dropsy, but it has now fallen into disuse[4, 238].

nrakta Britain and the Mediterranean region north to Lake Geneva. ksacta By water in ditches and marshy

propta Seed - surface sow in the spring and keep the compost moist[164]. The seed usually germinates in 2 - 6 weeks at 18°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow on for their first winter in a greenhouse and plant them out in late spring after the last expected frosts. Division in spring or autumn. Division is simple at almost any time of the year, so long as the roots are not allowed to become dry. Plant them out straight into their permanent positions.

nwatta Prefers a moist sandy loam[95, 117]. Succeeds in any good garden soil so long as it does not dry out[162], it also grows well in up to 30cm of water[200]. Plants are hardy

does not appeal to most people who have tried it[ K ]. Once in the mouth, it takes a lot of chewing before it is ready to be swallowed[ K ]. The leaves are used for making cakes[ 283 ]. This report could refer to the plants use as a poultice[ K ]. They are also used as a dye to make black rice cake. They are also used as a dye to make black rice cake.

tcanta Fibre Fodder PaperAgroforestry Uses: Planted to prevent erosion in gullies[ 331 ]. Other Uses A fibre is obtained from the inner bark of the stem - of excellent quality, it is highly water-resistant and has a greater tensile strength than cotton[ 418 ]. It is used for textiles, linen etc and is said to be moth-proof[ 1 , 46 , 57 , 61 , 74 , 171 ]. It is best harvested as the female flowers open[ 169 ]. The outer bark is removed and then the fibrous inner bark is taken off and boiled before being woven into thread[ 178 ]. The fibres are the longest known in the plant realm.[61, 171] The tensile strength is 7 times that of silk and 8 times that of cotton, this is improved on wetting the fibre [61]. The fibre is also used for making paper[ 189 ]. The leaves are removed from the stems, the stems are steamed and the fibres stripped off. The fibres are cooked for 2 hours with lye, fresh material might require longer cooking, and they are then beaten in a Hollander beater[ 189 ] before being made into paper.

dwatta Antiphlogistic Astringent Demulcent Diuretic Febrifuge Haemostatic Poultice Resolvent Vulnerary Women's complaintsAntiphlogistic, demulcent, diuretic, febrifuge, haemostatic and vulnerary. Used to prevent miscarriages and promote the drainage of pus [147, 178]. The leaves are astringent and resolvent [218, 240]. They are used in the treatment of fluxes and wounds [218]. The root contains the flavonoid rutin [283]. It is antiabortifacient, antibacterial, cooling, demulcent, diuretic, resolvent and uterosedative [218, 283]. It is used in the treatment of threatened abortions, colic of pregnancy, haemorrhoids, leucorrhoea, impetigo etc [283]. The fresh root is pounded into a mush and used as a poultice [283].

nrakta E. Asia - China to the Himalayas of Bhutan, Sikkim and Nepal. ksacta Rocky places to 1200 metres[109]. A very common plant in China, growing in thickets, roadsides, edges of forests in mountains at elevations of 200 - 1700 metres[266].

propta Seed - sow in pots and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and plant them out when at least 20cm tall. Division. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best planted in a nursery until they are growing away well. Layering. Basal cuttings. Harvest new shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade until they are rooting well.

Fodder Management: Hay Minor Global Crop Staple Crop: ProteinA plant of the sub-tropics to the tropics, also succeeding in warm temperate areas. The plant can be grown between latitudes 6 - 45°N and 9 - 38°S. It is adapted to a relative air humidity about 80%. Both excessive rainfall and drought affects the quality of the fibre. Relatively flat areas, not subject to flooding as well as gentle sloping lands, not subject to erosion are suitable for ramie production. It is found at elevations up to 1,300 metres. It grows best in areas where annual daytime temperatures are within the range 17 - 27°c, but can tolerate 10 - 34°c[ 418 ]. It prefers a mean annual rainfall in the range 1,500 - 2,500mm, but tolerates 1.000 - 4.000mm[ 418 ]. Requires a rich warm sandy soil that is very well drained 1 . 57 . 123 . 200 l. Succeeds in a wide range of soils so long as they are fertile[ 418 ]. Intolerant of wet soils[ 200 ]. This is a very greedy plant that can soon impoverish a soil, it requires a lot of feeding if it is to perform well[ 123 ]. All plant remains, after the fibre has been removed, should be returned to the soil 123]. Prefers a pH in the range 5.4 - 6.5, tolerating 4.8 -7.5[418]. Boehmeria nivea is an extremely variable species that is widespread over large areas of subtropical and tropical Asia. Its complex species includes several infraspecific taxa, four varieties of which are found in China[ 266 ]. The sub-species B. Nivea tenacissima. (Gaud.)Miguel., which produces the fibre 'Rhea' is a native of Malaysia and is not hardy in Britain[ 200 ]. Yields are from 375 to 900 kilos of fibre (per acre?)[ 123 ]. Two to four harvests per year are possible depending upon the climate, it is harvested as the stems turn brown 123 ]. Yields of green plants may in temperate regions vary between 15 - 20 tonnes/ha and in tropical

areas 8 - 10 tonnes/ha. Yields of about 1400 kg fibre/ha have been reported[ 418 ]. There are an increase in yields in the 2nd and 3rd year[ 418 ]. Stems can be harvested 2 - 3 times per year in temperate areas, 4 - 5 times in subtropical areas and in the tropics up to 6 crops can be produced annually[ 418 ]. The crop is normally replanted after 7 - 10 years, but may persist for 20 years[ 418 ]. The plant tends to take up whatever minerals are present in the soil. This could cause problems for example high uptake of molybdenum can lead to conditioned copper deficiency[ 289 ]. Found In: Africa, Asia, Australia, Bangladesh, Brazil, China\*, East Africa, Fiji, Haiti, Hawaii, India, Indochina, Indonesia, Japan, Laos, Malaysia, Mozambique, Norfolk Island, Pacific, Philippines, Rwanda, SE Asia, South America, Taiwan, USA, Vietnam.

### 7.2.322 Erysimum hieraciifolium

European wallflower,

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Erysimum hieraciifolium is a BIEN-NIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Édible Parts: LeavesEdible Uses: Tender young shoots and leaves - cooked as a vegetable[272].

nrakta Central and northern Europe to eastern Asia in Siberia, the Himalayas, China and Mongolia. ksacta Open damp grasslands at elevations of 1600 - 3500 metres in Nepal[272].

propta Seed - sow spring or late summer in situ. Germination should take place within 3 weeks.

nwatta Prefers a position in full sun in a circumneutral soil[200]. Succeeds in ordinary garden soils, tolerating poor and dry soils[200]. Plants are short-lived perennials and are often biennial[200]. A good nectar source for butterflies[200].

### 7.2.323 Podophyllum aurantiocaule

6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc

I'm in this state with they are to this well.

nwatta Fodder: Bank Industrial Crop: Fiber Management. Ecimhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis ler Management: Hay Minor Global Crop Staple Crop: hpa7tmwatli dyatxre7t hjonli

drutta Podophyllum aurantiocaule is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista We have seen no reports of toxicity for this species but all parts of the plant, except the fully ripe fruit, are almost certainly poisonous [K].

kcakta Edible Parts: FruitEdible Uses: We have no reports for this species but the following report is for the closely related P. hexandrum. Fruit - raw. It must only be eaten when it is fully ripe[1, 2, 61, 105]. Juicy but insipid[130]. The fruit is about 5cm long[200].

dwatta Antiphlogistic Cancer Cholagogue Cytostatic Depurative PurgativeThe plant is antiphlogistic and depurative[147]. The following report is for the related P. hexandrum. It quite probably also applies to this species. The whole plant, but especially the root, is cholagogue, cytostatic and purgative. The plant contains podophyllin, which has an antimyotic effect (it interferes with cell division and can thus prevent the growth of cells). It is, therefore, a possible treatment for cancer, and has been used especially in the treatment of ovarian cancer[46, 51, 57, 64, 65, 124, 244]. However, alopecia is said to be a common side-effect of this treatment[244]. This species contains about twice the quantity of

A decoction of the leaves is used as a gargle in treating inflammation of the vocal chords[240]. The root is anthelmintic and astringent[240]. A decoction of the root is used in the treatment of internal parasited[272].

nrakta E. Asia - China, Japan, Korea. ksacta Woods[11]. Forest margins, mountain slopes, fallow land and scrub in valleys in limestone areas at elevations of 500 - 2000 metres[266].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside [78, 113, 200]. Bury the cuttings to threequarters of their depth. Layering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. This species is closely related to M. indica, and is seen as conspecific by some botanists[266]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

#### 7.2.319 Physalis virginiana

Virginia Ground Cherry 6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Physalis virginiana is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention has been seen for this species, it belongs to a genus where many of the members have poisonous leaves and stems, though the full ripe fruits are usually edible[19, 65].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 105, 170]. The fruit is best after it has been touched by a frost[257]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calvx is toxic and should not be eaten

dwatta Cancer MiscellanyExtracts from the plant have shown anticancer activity[218]. An infusion of the whole plant has been used in the treatment of dizziness[257].

nrakta Eastern N. America - Ontario to Manitoba, Connecticut, Florida, Louisiana and Texas, ksacta Dry sandy or rocky woods, openings and clearings[43]. Rich soils in open woods and prairies[170].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170]. Division in spring[111]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in early summer[111]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots

and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any well-drained soil in full sun or light shade[200]. This plant has been growing successfully with us in Cornwall since 1990, though it is not setting

### 7.2.320 Levmus condensatus

Giant Wild Rve

6 tlin 9 cvuc 2 kcak 0 tcan 1 dwat 2 m hkuc

htut cyutli haatkyuctcup hwicli hyishrasilutnyik hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hionli

drutta Leymus condensatus is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed cooked[22, 46, 105, 161]. It can be ground into a flour and used to make bread[61, 95, 177]. The seed is rather small and rather difficult to extract[K].

tcanta Brush Thatching WeavingThe leaves are used for making mats, rope, paper etc. The stems are used for thatching roofs etc[257]. The roots can be tied together and used as a hair comb[257].

dwatta OphthalmicA decoction or infusion of the leaves has been used as a wash for sore eyes[257]. The dried leaves have been used to scrape pimples from the underside of the evelid[257].

nrakta Western N. America - Alberta to British Columbia, south to Nebraska, Arizona and California. ksacta Dunes by the coast, dry plains and slopes[43]. Also found in damp alkaline soils near streams[95].

propta Seed - sow mid spring in situ and only just cover the seed[162]. Germination should take place within 2 weeks. If the supply of seed is limited, it can also be sown in mid spring in a cold frame. Only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and plant them out in summer[K] Division in spring or summer[162]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils, preferring a sandy soil and a sunny position[1, 162]. Established plants are drought resistant[61]. Plants are tolerant of saline and alkaline soils[61]. A very variable species[1], it is possibly suitable for cultivation as a perennial cereal[95].

#### 7.2.321 Boehmeria nivea

Ramie, Chinese Grass, Chinese Silk Plant 6 tlin 9 cvuc 2 kcak 5 tcan 2 dwat 1.8 m hkuc hmimhtut cyutli kyuctcup hwicli hras hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Boehmeria nivea is an evergreen Perennial growing to 1.8 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers

pcista Although members of the nettle family, plants in this genus do not have stinging hairs[235].

kcakta Edible Parts: Leaves RootEdible Uses: Edible portion: Root, Leaves, Seeds - oil. Root - peeled and boiled. A pleasant, sweet taste[ 179 ]. We can detect very little flavour, but the root has a very strange mucilaginous texture that to about -15°c[200]. A very ornamental plant[1], though it basic (mildly alkaline) soils. It can grow in semi-shade (light can spread freely at the roots when well-suited[233]. Galingale was one of the favourite spices of the medieval kitchen and was an ingredient of 'pokerounce', a kind of medieval cinnamon toast[183]. It is rarely used at present. Both the root and the stem have a sweet moss-like perfume, resembling that of the violet but not so pure. The aroma becomes more fragrant with age[245].

### 7.2.311 Chrysolepis chrysophylla

Golden Chinguapin, Giant chinguapin 6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 20 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Chrysolepis chrysophylla is an evergreen Tree growing to 20 m (65ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, midges. Suitable for: light (sandy) and medium (loamy) soils and prefers welldrained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[22, 46]. Very sweet and much appreciated[63, 71, 82, 105, 183]. The seed can also be dried, ground into a powder and used as a thickening in soups, mixed with cereals when making bread etc[257]. The seed is about 1cm long and has a hard shell[183].

tcanta WoodWood - fine-grained, light, soft, not strong Occasionally used for making ploughs and other agricultural implements, and also as a fuel[46, 61, 82, 229].

nrakta South-western N. America - Washington to Oregon and California. ksacta Forested slopes near the coast in California[71]. Found in many soil types ranging from dry and rocky to deep rich soils[229].

propta Seed - best sown in a cold frame as soon as it is ripe, the seed must be protected from mice etc[200]. The seed has a short viability and should not be allowed to dry out. If stored overwinter it should be kept cool and moist. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors.

nwatta Requires a lime-free soil[1]. Prefers a sheltered semi-shaded position and a light deep moist soil[1, 11]. A very ornamental tree[183], it is slow to moderate growing and can live 400 - 500 years in the wild[229]. One report says that this species only succeeds in Oceanic and Mediterranean climates[200]. This species has a very wide natural range in N. America, seeds should be tried from various provenances to find more suitable selections for Britain[11]. Another report says that the plant is only found in a small area of California and Oregon, but that it grows on a wide range of soil types[229]. There are trees 16 metres tall in Surrey and Buckinghamshire[11], it also fruits in Cornwall[59] and fruits well in addition to self-sowing at Edinburgh botanical gardens[11]. Flowers are produced on the current years growth, the seed taking two summers to mature[229]. The catkins have an unpleasant hawthornlike smell to attract midges for their pollination[245]. This species resists chestnut blight[200].

### 7.2.312 Chusquea guila

Argentinian guila

6 tlin 9 cvuc 2 kcak 0 tcan 0 dwat 5 m hkuc hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Chusquea quila is an evergreen Bamboo growing to 5 m (16ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and

woodland). It prefers moist soil and can tolerate drought.

kcakta Edible Parts: StemEdible Uses: Young shoots cooked[25, 177].

tcanta Musical WoodThe canes are used in making musical instruments, plain furniture and fencing[139].

nrakta S. America - Argentina, Chile. ksacta Not known propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Very difficult[200]. Take divisions with at least four canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Prefers a damp humus rich soil[200]. Prefers an open loam of reasonable quality, doing well on peat[11]. Likes plenty of moisture in the growing season[11]. Established plants are drought tolerant[25, 162, 195]. They reguire a position sheltered from cold north and east winds[11]. 200]. A very hardy plant[25, 162], tolerating temperatures down to about -15°c[200]. Another report says that the plant is probably only hardy in the milder areas of the country[1]. It succeeds outdoors at Edinburgh Botanical Gardens[195] and is growing well at Kew[K]. This species is found further south in the world than any other species of bamboo, it grows in Chile as far south as latitude 47° south[195]. The rootstock is caespitose, new shoots are produced from late April and can grow 15cm overnight[25]. Plants take 2 - 3 years to settle down after being moved but are then guite fast growing[162]. Another report says that they are slow growing[188]. This species is notably resistant to honey fungus[200]. Plants flower and produce seed annually in the wild without dving as a result of the flowering[162]. Plants of the cultivar 'Tenuis' have been observed to be flowering in 1994, this is the first record of this species flowering in the northern hemisphere[214].

#### 7.2.313 Paederia foetida

Skunk Vine

6 tlin 12 cyuc 2 kcak 2 tcan 4 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwishsom hpa7tmwatli dvat hionli

drutta Paederia foetida is a CLIMBER growing to 4 m (13ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Bees, Butterflies. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: Leaves StemEdible Uses: Leaves raw or cooked[301]. Although they have a strong flavour, the leaves are sometimes mixed with grated coconut and spices, and then eaten raw as a side-dish with rice[301, 310]. The minced leaves are steamed and eaten; they can be added to soups; or are mixed with various vegetables and spices, then wrapped in a banana leaf and cooked over a fire[301]. Any offensive smell disappears as the leaves are cooked[301]. The leaves are valued more for their medicinal virtues than for their flavour![K]. The sweet stem juice is sucked in Taiwan[177 . 183 ].

tcanta Other Uses The stem yields a strong and silky fibre, but it is not commercially exploited[310]. An ethanolic extract of the leaves and stem has been shown to be significantly toxic against the aphid Myzus persicae infesting cabbage in India[310]

dwatta DysenteryThe leaves are widely used in Asia and South-East Asia, where they are especially valued for treating digestive problems[310]. Considerable research has been carried out into the medicinal benefits of the plants, with several active compounds having been recorded[310]. Several iridoid glucosides such as asperuloside, scandoside

and paederoside have been isolated from the aerial parts of the plant[310]. These glucosides have displayed antitumor activity with paederoside displaying the highest degree of antitumor-promoting activity[310]. Scandoside has been shown to promote the growth of lettuce seedlings. Paederoside showed a similar inhibitory activity to that of asperuloside and daecetyl-asperulosidic acid in a plant growth inhibition test and in an antimicroorganism activity test[310]. The bruised aerial parts of the plant have the fetid odour of indole (methyl-mercaptan). Damage to the tissue releases an enzyme which splits off this sulphur-containing group from paederoside, and is therefore responsible for the unpleasant odour. The most abundant sulphur-containing compound was dimethyl disulphide[310]. The presence of alkaloids and an essential oil have also been recorded[310] ]. Monoterpenes such as linalol constitute the major components in the oil[310]. In older investigations, decoctions of the plant showed significant anti-inflammatory action against arthritis[310]. The decoction also exhibited marked activity against degenerative osteo-arthritis[310]. The water soluble fraction of the aerial parts displayed antiinflammatory activity in oedema[310]. It failed to exhibit any analgesic or antipyretic action and showed no ulcerogenic potential[310]. An ethanolic extract of the leaves has shown anticancer activity against human epidermoid carcinoma of the nasopharynx[310]. A methanol extract of the leaves has shown hepatoprotective potential, being effective in reversing 6 out of 12 common biochemical (enzymatic) parameters assessed[310]. Another study has shown that the plant has antidiarrhoeal activity, acting by inhibiting intestinal motility - thus supporting its use in traditional medicine[360]. The leaves are anodyne, antirheumatic, antivinous, astringent, carminative, depurative, diuretic, restorative and vermifuge[147, 218, 310]. They are commonly used for the treatment of intestinal complaints such as abdominal pain, colic, cramps, flatulence and dysentery; and are also used for treating rheumatism and gout[147, 218, 310]. The leaves are also used to treat infertility and paralysis[218]. The leaves and stems are also used as a diuretic for inflammation of the urethra[310 ]. For treating intestinal problems, the fresh leaves are pounded, water added, and the filtered infusion is drunk regularly till convalescence[310]. The plant is considered to have great restorative powers, and the leaves may thus be mixed with food, boiled and eaten - in India, they are often boiled in soup to lessen their smell[310 1. Applied externally, the leaves are used to treat swellings and bruises in general, and are mashed then applied for earache, ulcerations of the nose and swollen eyes[272, 310]. They are used as a poultice for treating a swollen belly, distension, herpes or ringworm; and are used in antirheumatic baths[310]. They are applied to the abdomen as a diuretic, and also as a solvent for vesical stones[310]. The juice of the leaves is considered astringent, and is used to treat diarrhoea in children[310]. The bark and the root are considered to be emetic[310]. The juice of the root is prescribed in cases of indigestion, piles, inflammation of the spleen, and pain in the chest and liver[272, 310]. It may help to eliminate poisons collected in the system[310]. In some parts of India, the fruit is used to blacken teeth, and it is also considered a medicine to prevent and treat toothache[310, 360].

nrakta E. Asia - China, Japan, Korea, Indian subcontinent, Myanmar, Thailand, Cambodia, Laos, Vietnam, Malaysia, Indonesia, Philippines. ksacta A ruderal in thickets and woodland, also along forest edges, in secondary evergreen to deciduous forest and clearings in primary forest[310]. Also grows in montane vegetation up to 3,000 m, on steep, forested slopes, or on sandy or rocky sea coasts[310].

propta Seed - despite its weediness, the plant germinates rather slowly, with tetraploids germinating quicker than hexaploids, in 5 - 22 days, or in 17 - 24 days, respectively[310]. Layering. Sometimes, shoots produce adventitious roots when they come in contact with the soil, and can thus be propagated[310]

nwatta Found in a range of environments from the warm temperate zone to the tropics. It is tolerant of at least some frost[413]. Succeeds in any fertile soil so long as it is well drained[182, 219]. Plants have a wide ranging adaptability to different levels of light, types of soil, and salt conditions[413]. Requires a sunny sheltered position[219]. A very variable plant[58]. The plant has escaped from cultivation and become naturalised in many areas[310]. It has become a serious weed of young sugarcane[305]. The vines

climb over shrubs and trees, weighing them down and impeding regeneration[413]. They also invade pastureland and are troublesome along roads and on power lines[413]. The seeds may be dispersed by birds and the plant is also spread by the transport of rooted fragments[413]. The plant can be found flowering and fruiting throughout the year in tropical and subtropical conditions; in other localities, it flowers during the rainy season, and fruits early in the dry season[310]. Individual flowers are short-lived, open early in the morning and fall off after 2 days; entire inflorescences, however, bear flowers for a long period of time[310]. Flowering Time: Mid Summer Late Summer/Early Fall. Bloom Color: Red White/Near White.

### 7.2.314 Artemisia tripartita

Threetip Sage Brush, Wyoming threetip sagebrush 6 tlin 9 cyuc 2 koak 0 tcan 1 dwat 1.8 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Artemisia tripartita is a SHRUB growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista Although no reports of toxicity have been seen for this species, skin contact with some members of this genus can cause dermatitis or other allergic reactions in some people[222].

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves[61]. No further details are given. Seed[46, 61, 105, 161, 257]. No further details are given, but the seed is very small and fiddly to use[K].

tcanta TinderThe bark is used as a tinder when making fires[257].

dwatta Diaphoretic VulneraryAn infusion of the roots, or a decoction of the leaves and branches, is used in the treatment of colds, sore throats, tonsillitis, headaches etc[257]. An infusion of the plant is used as a wash for wounds caused by the removal of corns[257].

nrakta North-western N. America. ksacta Dry plains and hills, often in somewhat moister or more favoured sites or at slightly higher elevations than A. tridentata to which it is akin[60].

propta Seed - surface sow from late winter to early summer in a greenhouse in a very free-draining soil, but do not allow it to dry out. The seed usually germinates in 1 - 2 weeks in a warm greenhouse[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter, planting them out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame. Very slow to root[11] Division in spring or autumn. Lavering[164].

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Succeds in most soils including those of low fertility[164]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Established plants are very drought tolerant[200]. Plants resprout freely after a fire[60, 164]. The sub-species A. tripartita rupicola is a dwarf form growing only 15cm tall, whilst A. tripartita tripartita grows to 1.8 metres[164]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.315 Cichorium spinosum

1180

6tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cichorium spinosum is a BIENNIAL/PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil.

Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - boiled[148].

nrakta Europe - Mediterranean. ksacta Seashores in Greece[148].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Succeeds in any moderately fertile well-drained soil[200]. Prefers a medium to light sandy or gravelly soil that is rich in humus[1]. Prefers a sunny position[200] but with light shade in the summer to prevent plants running to seed.

#### 7.2.316 Vaccinium arboreum

Farkleberry

6 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium arboreum is an evergreen Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Dry and slightly astringent but with a pleasant flavour[82]. Dry and insipid according to another report[183] whilst another says that it is dry, sweet and mealy[227] and yet another says that it is bitter and inedible[200]. The fruit is about 6mm in diameter[2001.

tcanta Rootstock Tannin WoodSaid to be an excellent rootstock for 'Rabbiteye' blueberries (V. ashei)[183]. Tannin is obtained from the bark and root[82, 227]. Wood - heavy, hard, very close grained. It weighs 48lb per cubic foot. Used for making tool handles and other small articles [82, 227].

dwatta Astringent DysenteryThe berries, root-bark and leaves are very astringent and have been used internally in the treatment of diarrhoea, dysentery etc[4, 82, 229]. The infusion is valuable in treating sore throats, chronic ophthalmia leucorrhoea etc[4]

nrakta South-eastern N. America - Virginia to Florida, west to Texas. ksacta Moist sandy soils by ponds and streams[82]. Usually found in most shady slightly alkaline soils along stream banks, bluffs, hammocks and in open woods[229].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants are deciduous when growing in cold climates[11]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.317 Arisaema costatum

6 tlin 9 cyuc 2 kcak 0 tcan 0 dwat 0.6 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli dvat hionli

drutta Arisaema costatum is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The plant contains calcium oxylate crystals. These cause an extremely unpleasant sensation similar to needles being stuck into the mouth and tongue if they are eaten but they are easily neutralized by thoroughly drying or cooking the plant or by steeping it in water.

koakta Édible Parts: RootÉdible Uses: Root - cooked. It is boiled, dried and then ground into a powder[2, 177]. The tuber is 3 - 5cm in diameter[266]. Some caution is advised, see the notes above on toxicity.

nrakta E. Asia - Himalayas in C. and E. Nepal. ksacta Wet cool woodlands and cliffs, often forming large colonies. Shrubberies, 2000 - 2600 metres[51]. Grasslands in forest areas at elevations of 2300-2400 metres[266].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame [134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1-6 months at  $15\,^{\circ}\text{c}[134]$ . When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a coupe of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog, woodland garden or a sheltered border in semi-shade[200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. Plants are nearly hardy in Britain, they normally succeed outdoors in the milder areas of the country[1]. Tubers should be planted about 15cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants meld protection from slugs[200]. This species has very large leaves, to 40cm long[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

#### 7.2.318 Morus australis

Korean Mulberry, Aino Mulberry 6 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 7.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Morus australis is a deciduous Tree growing to 7.5 m (24ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June, and the seeds ripen from July to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[3, 272]. Sweet and juicy[183] but insipid[1, 11]. The fruit is about 15mm in diameter[200].

tcanta FibreThe bark fibers are used for making pa-

dwatta Anthelmintic Aromatic Astringent Febrifuge Laxative PurgativeThe fruit is aromatic, cooling and laxative[240]. Its use allays thirst and it is of help in the treatment of fevers[240]. The bark is anthelmintic and purgative[240]. A paste of the bark is used in the treatment of qinqivitis[272].

finely grated root was applied externally to relieve rheumatic pains, ulcers and scrofulous tumours[244]. It was also used internally to treat melancholy, convulsions and mania[244]. When taken internally in large doses, however, it is said to excite delirium and madness[4]. The root should be used with caution, and only under the supervision of a qualified practitioner[21, 238]. See the notes above on toxicity. The leaves are harmless and cooling. They have been used for ointments and other external applications to ulcers etc[4].

nrakta South-eastern Europe. ksacta Open woodland, deserted fields and stony places[21, 89].

propta Seed - best sown in a cold frame in the autumn[188]. The seed can also be sown in spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Root cuttings in winter[200]. Division. This can be rather difficult since the plants resent root disturbance.

nwatta Prefers a deep humus-rich light soil and a sheltered position in full sun[238]. It also tolerates some shade[200]. Prefers a circumneutral soil[200] and dislikes chalk or gravel[4]. Plants are liable to rot in wet or illdraining soils[4]. Plants are hardy to about -15°c[187]. The roots are somewhat carrot-shaped and can be up to 1.2 metres long[4]. Plants are intolerant of root disturbance and should be put out into their permanent positions as soon as possible [188]. The root often divides into two and is vaguely suggestive of the human body. In the past it was frequently made into amulets which were believed to bring good fortune, cure sterility etc[244]. There is a superstition that if a person pulls up this root they will be condemned to hell[244]. Therefore in the past people have tied the roots to the bodies of animals and then used these animals in order to pull the roots out of the soil

## 7.2.486 Athyrium yokoscense

6tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc pcimhmim cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Athyrium yokoscense is a FERN growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist or wet soil.

pcista Although we have found no reports of toxicity for this species, a number of ferns contain carcinogens so some caution is advisable[200]. Many ferns also contain thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people eating an adequate diet that is rich in vitamin B, though large quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172].

kcakta Edible Parts: LeavesEdible Uses: Very young fronds (croziers) - boiled[177]. Some caution is advised. See the notes above on toxicity.

nrakta E. Asia - China, Japan, Korea. ksacta Woods in lowland and mountains all over Japan[58]. Thin deciduous woods and thickets[74].

propta Spores' surface sow in a pot of sterile compost in a shady part of the greenhouse and keep moist, this is most easily done by putting the pot in a plastic bag. Pot up small clumps of the plants when they are large enough to handle and keep them moist until they are established. Plant out in late spring of the following year. Division in spring as plants come into growth. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta An easily grown plant, it is calcifuge and prefers an acid soil with a pH from 4.5 to 6.5, but it tolerates alkaline soils if plenty of leaf mould is added[200]. Grows well in heavy clay soils. Prefers a moist sheltered site with moderately high atmospheric humidity[200]. Succeeds in a semishaded boq-garden or in damp woodland, also in garden bor-

ders in full or part shade[200]. This species is very variable, partly according to altitudes and habitats[275]. Plants growing on sunny rocks and in high mountains look like Athyrium rupestre and may be distinguished as var. alpicola[275]. Lowland plants with deeply tripinnatifid leaves may be called var. dilatatum[275]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 7.2.487 Swertia bimaculata

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Swertia bimaculata is a ANNUAL/BIENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[105, 177, 179].

nrakta E. Asia - China, Japan, Himalayas. ksacta Wet grassy places in lowland and mountains all over Japan[58]. Beside streams, swamp, meadows, scrub and forests at elevations of 200 - 3000 metres in China.

propta Seed - sow spring in a cold frame at 10°c or less[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta We have no details for this species but suggest growing it in a moist well-drained soil in a sunny position.

#### 7.2.488 Sedum lineare

Needle stonecrop

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sedum lineare is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista Although not poisonous, if large quantities of this plant are eaten it can cause a stomach upset[62, 85]. Another report says that the plant is slightly poisonous[218].

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[179]. Some caution is advised[218].

dwatta PoulticeThe fresh plant is crushed and applied externally to burns and scalds[218].

nrakta E. Asia - S.E. China, C. and S. Japan. ksacta Low mountains, rocks on grassy slopes and plains[266].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Succeeds on a wall[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]

least one named variety[183]. There are many named varieties selected for their ornamental value[11]. The flowers are richly scented[245]. Hybridizes freely with other members of this genus[80]. Plants in this genus are notably susceptible to honey fungus[200].

#### 7.2.370 Eleutherococcus innovans

Taka-No-Tsume

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc

htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Eleutherococcus innovans is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked. A famine food, it is only used in times of scarcity[177].

nrakta E. Asia - Japan. ksacta Common in hills and mountains all over Japan [58, 275].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame or greenhouse[200]. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings in late winter in a greenhouse[200]. Division of suckers in the dormant season[200].

nwatta Prefers a humus-rich well-drained soil in full sun[200]. Tolerates poor soils and atmospheric pollution[200]. Requires shelter from cold north and east winds[200]. Plants are hardy to between -10 and -15°c[200].

#### 7.2.371 Ilex vomitoria

Yaupon Holly

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta flex vomitoria is an evergreen Shrub growing to 6 m (19ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274]. The fruit is poisonous[177].

kcakta Edible Parts: Edible Uses: Condiment TeaA mildly stimulating beverage containing caffeine is made from the dried and roasted leaves[43, 171, 183]. The tea is stimulating and intoxicating[161]. The leaves are first steeped in cold and then in boiling water[183]. They are also used to flavour ice cream and soft drinks[183].

tcanta Hedge Hedge WoodThis species is occasionally used for hedging in the southern states of America[82]. Wood - hard, heavy, strong, close grained. It weighs 46lb per cubic foot. Too small for commercial exploitation, the wood is used locally for turnery, inlay work, woodenware etc[82, 149, 227, 229].

dwatta EmeticA decoction of the leaves is emetic[4, 11, 171]. The plant was used ritually by several N. American Indian tribes. The leaves were toasted over a fire and then boiled for several hours. The resulting thick black liquid

was then drunk and this was followed by immediate vomiting[213]. This was often used a a purification rite prior to hunting[213].

nrakta South-eastern N. America - Virginia to Florida, west to Texas and Arkansas. ksacta Sandy woods and clearings[43]. Low moist woods, especially near the coast[149]. Often forming dense thickets along streams and pond margins and shallow swamp lands[229].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years[78].

mwatta Succeeds in most soils so long as they are not water-logged[200]. This species is not fully hardy in Britain, the plants are incapable of withstanding our hardest winters[11]. A slow-growing species in the wild, often forming dense thickets from root suckers[229]. The leaves remain on the plant for 2 - 3 years, falling just before the appearance of new leaves in the spring[82]. Flowers are produced on the current year's growth[229]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.372 Salix appendiculata

wis hpa7tmwatli nyanhjen hjonli

6 tlin 9 cyuc 1 kcak 3 tcan 2 dwat 6 m hkuc htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatprikl-

drutta Salix appendiculata is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: Inner bark LeavesEdible Uses: Inner bark - raw or cooked. It can be dried, ground into a powder and then added to cereal flour for use in making bread etc. A very bitter flavour, it is a famine food that is only used when all else fails[172]. Young shoots - not very palatable[172].

tcanta Soil reclamationA pioneer plant for difficult sites[200]. It is often found in the wild as a pioneer on land-slides etc, especially on calcareous formations[11]. Dynamic accumulator.

dwatta Anodyne FebrifugeThe fresh bark of all members of this genus contains salicin[226], which probably decomposes into salicylic acid (closely related to aspirin) in the human body[213]. This is used as an anodyne and febrifuge[226].

nrakta C. Europe - Balkans. ksacta A pioneer of difficult sites. including landslides on calcareous formations[11].

propta Seed - must be surface sown as soon as it is ripe in late spring. It has a very short viability, perhaps as little as a few days. Cuttings of mature wood of the current year's growth, November to February in a sheltered outdoor bed or planted straight into their permanent position and given a good weed-suppressing mulch. Very easy, Plant into

their permanent positions in the autumn. Cuttings of halfripe wood, June to August in a frame. Very easy.

nwatta Succeeds in most soils, including wet, ill-drained or intermittently flooded soils[1, 11], but prefers a damp, heavy soil in a sunny position[200]. Hybridizes freely with other members of this genus[200]. Although the flowers are produced in catkins early in the year, they are pollinated by bees and other insects rather than by the wind[11]. Plants in this genus are notably susceptible to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

#### 7.2.373 Mimulus moschatus

Musk Monkey Flower, Muskflower 6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Mimulus moschatus is a PERENNIAL growing to 0.3 m (1ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Young plant - boiled and used for food[257]. nrakta Western N. America - British Columbia to Montana and California. Naturalized in Britain[17]. ksacta Naturalized in wet places in England and Eastern Ireland[17].

propta Seed - sow spring in a greenhouse and only lightly cover the seed[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed it can also be sown in situ in late spring after the last expected frosts[200]. Division in spring[200]. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Cuttings of softwood, 5cm long in spring or summer[200].

watta Prefers rather moist places such as damp borders, margins of streams and boggy spots[1, 111]. Grows well in heavy clay soils. Thrives in full sun so long as the soil does not dry out[200], otherwise it is best grown in partial shade[187]. Grows well in shallow water, but it can be invasive[200]. Hardy to at least -15°c[200]. There are some named varieties, selected for their ornamental value[200]. All parts of the plant have a musky scent, though the form naturalized in Britain, and most cultivars, appear to be scentless[17, 200].

### 7.2.374 Coprosma propingua

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma propinqua is an evergreen Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from February to March, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked[173]. Sweet, but with little flavour[225]. The pale to deep violet-blue fruit is about 8mm wide[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta Dye Hedge HedgeTolerant of pruning, it makes a good dense hedging plant[225]. A yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Damp places[11]. Gravelly places throughout New Zealand[225].

1202

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. An easily grown plant, it succeeds in most soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[11, 200]. Another report says that it is fully hardy in Britain[225]. It flowers freely in Britain, fruiting heavily if pollinated[225]. A polymorphic species, it hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

### 7.2.375 Artemisia maritima

Sea Wormwood

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Artemisia maritima is a deciduous Shrub growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure

pcista The following notes are from a report on the closely related A. absinthum, they quite possibly also apply to this species. The plant is poisonous if used in large quantities[20, 61]. Even small quantities have been known to cause nervous disorders, convulsions, insomnia etc[222]. Just the scent of the plant has been known to cause headaches and nervousness in some people[169].

kcakta Edible Parts: Edible Uses: CondimentThe leaves are occasionally used as a flavouring[183]. Some caution is advised, see the notes above on toxicity.

tcanta Repellent StrewingThe growing shoots are said to repel insects and mice[6, 18, 20], they have also been used as a strewing herb[4, 14]. An infusion is said to discourage slugs and insects[14, 18].

dwatta Anthelmintic Antiseptic Antispasmodic Carminative Cholagogue Emmenagogue Febrifuge Stimulant Stomachic Tonic VermifugeSea wormwood is not much used in herbal medicine, though it is often used domestically. Its medicinal virtues are similar to wormwood, A. absinthum, though milder in their action. It is used mainly as a tonic to the digestive system, in treating intermittent fevers and as a vermifuge[4]. The leaves and flowering shoots are anthelmintic, antiseptic, antispasmodic, carminative, cholagogue, emmenagogue, febrifuge, stimulant, stomachic, tonic and vermifuge[4, 145]. The plant is harvested as it comes into flower and is dried for later use[4]. The unexpanded floral heads contain the vermicide 'santonin'[218].

nrakta Much of Europe, including Britain, east to central Asia. ksacta Drier parts of salt marshes[17] in sand and shingle[190].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame. Division in spring or autumn[200].

nwatta Succeeds in any soil but prefers a poor dry soil with a warm aspect[37]. Easily grown in a well-drained cir-

### 7.2.483 Sedum rupestre

Crooked Yellow Stonecrop 6 tlin 9 cyuc 1 kcak 2 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli priklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum rupestre is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista Although not poisonous, if large quantities of this plant are eaten it can cause a stomach upset 62.851.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[4, 52, 115, 183]. A slightly astringent sour taste makes this plant a useful addition to a green tossed salad and it can also be added to soups or used as a vegetable[9, 183]. Used in salads. it has a fine relish[2].

tcanta Agroforestry Uses: A good ground cover plant for a sunny position[188]. The somewhat open growth habit makes it suitable for growing with larger bulbs such as some lilies[K]. Place starter plants 20 - 30cm apart in order to obtain rapid massing as a ground cover[352]. The plant is used on 'green roof' and 'green wall' systems in Korea. These systems are incorporated into the structure of the building, providing habitats for wildlife as well as insulating the building and helping to improve the environment. The cultivar 'Blue Spruce' has been specifically mentioned [1240]. 1241]

nrakta C. W. and S. Europe. Naturalized in Britain[17]. ksacta Walls, shingle and warm grassy places on sandy soils[4, 9]. Avoids acid soils.

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil[200]. Requires a sunny position[188, 200]. The plant flowers best when grown in a sunny position, though it also succeeds in semi-shade[219]. Established plants are very drought tolerant[200], they grow well in dry soils and can also be grown in a crevice on a wall[200, 219]. This species is hardy to about -15°c[200]. A mat forming plant, it spreads rapidly and it is not suitable for the rockery[83]. All members of this genus are said to have edible leaves, though those species, such as this one, that have vellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

### 7.2.484 Geranium viscosissimum

Sticky Geranium, Sticky purple geranium 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Geranium viscosissimum is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Flowers - added to salads or used as a garnish[172, 183]. Leaves - raw or cooked. Not choice[172].

dwatta Astringent Salve StypticThe whole plant is astringent, salve and styptic[176]. An infusion of the leaves, plus a sweat bath with the leaves, is used as a treatment for colds[257]. It is used as a gargle in the treatment of sore throats[176]. An infusion of the leaves or the roots is used as a wash for sore eyes[257]. A poultice of the leaves or roots has been applied to cuts, sores etc[257].

nrakta Western N. America - British Columbia to N. California, east to Alberta.. ksacta Open woods and meadows[187]. Plentiful in medium-dry to moist or even wet soils of open woods, roadsides, creek banks and meadows to an altitude of 2,700 metres[212].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any good soil in sun or partial shade[187]. Plants are hardy to about -25°c[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This species is closely related to G. nervo-sum[200].

## 7.2.485 Mandragora officinarum

Mandrake

1239

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.1 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Mandragora officinarum is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf from March to July, in flower from March to April, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is polinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista All parts of the plant are poisonous[19, 21]. Only slightly so according to one report[89]. Not recommended as a herbal medicine [301]. Toxicity signs include: skin reddening, dry mouth, tachycardia, arrhythmias, pupil dilation [301]

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A delicacy[89]. The fruit is about the size of a small apple, with a strong apple-like scent[4]. Caution is advised in the use of this fruit, it is quite possibly poisonous[X].

dwatta Cathartic Emetic Hallucinogenic NarcoticMandrake has a long history of medicinal use, though superstion has played a large part in the uses it has been applied to. It is rarely prescribed in modern herbalism[238], though it contains hyoscine which is the standard pre-operative medication given to soothe patients and reduce bronchial secretions[244]. It is also used to treat travel sickness[244]. The fresh or dried root contains highly poisonous alkaloids and is cathartic, strongly emetic, hallucinogenic and narcotic[4, 21, 46, 192, 244]. In sufficient quantities it induces a state of oblivion and was used as an anaesthetic for operations in early surgery[238]. It was much used in the past for its anodyne and soporific properties[4]. In the past, juice from the

drutta Inula britannica chinensis is a PERENNIAL growing to  $0.6\,\mathrm{m}$  (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[179]. An emergency food, it is only used when better foods are not available[177].

dwatta Alterative Carminative Cholagogue Deobstruent Expectorant Laxative Nervine Stomachic Tonic VulneraryXuan Fu Hua is used in Chinese herbalism as a mildly warming expectorant remedy and it is especially suitable where phlegm has accumulated in the chest[254]. It has been used as an adulterant of arnica (Arnica montana)[4]. The flowers are more commonly used, but the leaves are also used, generally for less serious conditions[254]. The leaf is discutient and vulnerary[218]. The flowers are alterative, antibacterial, carminative, cholagogue, deobstruent, depurative, diuretic, expectorant, laxative, nervine, stomachic, tonic and vulnerary[147, 176, 178, 218, 279]. They are used internally in the treatment of bronchial complaints with profuse phlegm, nausea and vomiting, hiccups and flatulence[176, 238]. The flowers have an antibacterial action, but this can be destroyed by proteins in the body[176]. The plant is harvested when in flower and can be dried for later use[254]. The root is discutient, resolvent and vulnerary[218]. The plant has been mentioned as a possible treatment for cancer of the oesophagus[218].

nrakta E. Asia - China and Japan. ksacta Wet places in lowlands, especially by rivers, all over Japan[58].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying a sowing in situ in the spring or the autumn. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in any moderately fertile well-drained soil[200]. Grows well in heavy clay soils. Plants are hardy to at least -15°c[238]. This sub-species is the form that is most used medicinally, it is cultivated as a medicinal plant in China[178].

### 7.2.480 Coprosma pumila

 $6\ tlin\ 9\ cyuc\ 1\ kcak\ 0\ tcan\ 0\ dwat\ 0.1\ m\ hkuc$ hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma pumila is an evergreen Shrub growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but with little flavour[225]. The orangered fleshy fruit is about 7mm in diameter, though forms with fruits up to 13mm have been seen[225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta Australia, New Zealand. ksacta Higher montane to sub-alpine grassland, North, South and Stewart Islands[44]

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[KI]. Sow stored seed in spring in a cold frame[Z0]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Prefers a are drought tolerant[190].

permanent moist and peaty soil, but it is not an easy plant to grow in Britain[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Another report says that it is fully hardy in Britain[225]. Closely related to C. atropurpurea and often confused with that species[225]. It is a very variable plant, hybridizing freely with other members of this genus[200, 225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required. There is some confusion over the correct name of this species, it could be a part of C. petriei[200].

### 7.2.481 Carthamus lanatus

Distaff Thistle

6 tlin 10 cyuc 1 kcak 1 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Carthamus lanatus is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta An edible oil is obtained from the seed[105, 183].

tcanta An oil is obtained from the seed[240], though the report gives no more details[K].

dwatta The plant is anthelmintic, diaphoretic and febrifuge [240].

nrakta S. Europe. A casual in Britain[17]. ksacta Amongst rocks, in dry hills and uncultivated ground[89].

propta Seed - sow spring in gentle heat in a greenhouse. Germination usually takes place within 2- 4 weeks at  $15^{\circ}c[138]$ . When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in late spring or early summer. The seed can also be sown in situ in April/May[138] but plants may not then mature their seed.

nwatta Succeeds in ordinary garden soil[1]. Requires a position in full sun[138]. This species is a potentially serious pest plant in N. America[274].

### 7.2.482 Echinops spinosissimus

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.8 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Echinops spinosissimus is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: GumYields a gum that is used for chewing [46, 61, 177].

nrakta Europe - Mediterranean. ksacta Fields and rocky blaces[89].

propta Seed - sow early spring in a cold frame[111]. The seed usually germinates in 3 - 9 weeks at 25°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in an outdoor seedbed in mid spring and is then planted out into its permanent position in late summer or the autumn[111]. Division in autumn[111]. Root cuttings in the winter[200].

nwatta Succeeds in a sunny position in any well drained soil of low or medium fertility[175, 200]. Established plants are drought tolerant[190].

cumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Tolerates a pH in the range 6.0 to 7.6. Dislikes shade. Established plants are very drought tolerant[190, 200]. Tolerates maritime exposure[190]. The whole plant has a sweet aromatic smell[245]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.376 Chimaphila maculata

Spotted Wintergreen, Striped prince's pine, Pipsissewa 6 tlin 7 cyuc 1 kcak 2 tcan 3 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Chimaphila maculata is an evergreen Shrub growing to 0.3 m (1ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaThe leaves are used as a snack, being nibbled for their refreshing qualities[183, 257]. In Mexico the herb is used as a catalyst in the preparation of 'tesguino', an alcoholic beverage produced from sprouted maize[183].

to tanta The plants stoloniferous root system, and dwarf spreading habit make it a god ground cover, though it is a difficult plant to establish and grow well[245].

dwatta Analgesic Antibacterial Antiscrophulatic Astringent Cancer Diaphoretic Diuretic Febrifuge Rubefacient Skin Stimulant Tonic UrinaryThe plant is analgesic, antibacterial, astringent, diaphoretic, diuretic, febrifuge, rubefacient, stimulant and tonic[4, 207, 222, 257]. The plant has an antiseptic influence on the urinary system and is sometimes used in the treatment of cystitis[4]. An infusion of the plant has been drunk in the treatment of rheumatism and colds[257]. Apoultice of the root has been used to treat pain[257] whilst the plant has also been used as a wash on ulcers, scrofula and cancers[257]. All parts of the plant can be used, though only the leaves are officinal[4]. The plant is loaded with the biologically active compounds arbutin, sitosterol and ursolic acid[222]. Arbutin hydrolyzes to the toxic urinary antiseptic hydroquinone[222].

nrakta Eastern N. America - Illinois to Michigan and Ontario, south to Texas and Georgia. ksacta Rich woods[222]. Dry woods[235].

propta Seed - very difficult to germinate, see the notes in cultivation details. It is best sown on moist sphagnum peat. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Rather difficult because the plant is very sensitive to root disturbance. It is best attempted in the spring as the plant comes into growth[200]. Cuttings of softwood, June in a frame. Use some soil from around an established plant[14].

nwatta Landscape Uses:Ground cover, Woodland garden. Requires a light moist but well-drained lime-free soil and shade from direct sunlight[1]. This species is difficult to propagate and grow in cultivation, mainly because it has certain mycorrhizal associations in the wild and these are necessary if the plant is to thrive [200]. It is best to use some soil collected from around an established plant when sowing seed or planting out into a new position[200]. The plant has wide-spreading fibrous feeding roots and will often die or fail to increase in size if these are disturbed. The flowers are deliciously scented[245]. Special Features: North American native. The plant is heat tolerant in zones 8 through 5. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no

heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 7.2.377 Gunnera magellanica

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Gunnera magellanica is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: One report says that the fruit might be edible[177]. The fruit is about 5mm in diameter[200].

tcanta A carpeting plant that roots as it spreads, it is suitable for ground cover when spaced about 45cm apart each way[208].

nrakta S. America - S.W. Argentina, S. Chile and the Falkland Islands. ksacta Damp grassy places[187]. Moist sheltered places from sea-level to 1000 metres[69].

propta Seed - best sown as soon as it is ripe in the autumn in a sandy mix in a cold frame[200]. The seed can also be sown in the spring[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as new growth commences in the spring[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Requires a damp humus rich soil in a sunny position or semi-shade[1, 200]. Prefers a cool moist position[208]. Plants are hardy to at least -10°c[187]. The plant has a creeping root and spreads to form extensive patches[187]. The top part of the inflorescence is male, the bottom is female and the middle is hermaphrodite acording to one report whilst another says that the flowers are unisexual without saying if the two sexes are on the same plant[200]. Male and female flowers are on separate plants[188]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.378 Hibiscus moscheutos

Swamp Rose Mallow, Crimsoneyed rosemallow, Wild Cotton, Common Rosemallow, Eastern Rosemallow, Swamp 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Hibiscus moscheutos is a PERENNIAL growing to 2.5 m (8ft) by 2 m (6ft) la ta medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Although there are no reports of edibility for this species, most of the plants in this family have edible leaves and flowers [K]. The flowers are about 15cm in diameter [233],

though in some cultivars they are up to 25cm in diameter[260]. They have a mild flavour and somewhat mucilaginous texture with a slight bitterness in the aftertaste[K]. The leaves are rather bland and are also mucilaginous, but have a slight hairiness to them which detracts a little from the pleasure of eating them[K].

dwatta Demulcent Dysentery Emollient UrinaryThe leaves and roots abound in mucilage[222]. Like many other plants in this family, they are demulcent and emollient and are used in the treatment of dysentery, lung ailments and urinary ailments[222]. an infusion of the dried stalks has been used in the treatment of inflammation of the bladder[257].

nrakta Southern N. America - Massachusetts to Michigan, south to Alabama, Georgia and Florida, ksacta Saline marshes and the shores of lakes[260].

propta Seed - sow early spring in a greenhouse. Germination is usually rapid. Prick out the seedlings when they are large enough to handle and plant them out into their permanent positions in early summer. Some reports say that the seed can be sown in situ outside and that it gives a good rate of germination[78, 80, 113].

nwatta Landscape Uses:Border, Container, Foundation, Specimen. Prefers a well-drained humus rich fertile soil in a sheltered position in full sun[200]. Well-suited to a waterside planting[200]. One report says that the plants are hardy in zone 5 (tolerating winter temperatures down to about -25°c), this same report also says that the plant succeeds outdoors in Britain only in those areas where winter temperatures do not fall below about -5°c[200]. Another report says that it needs to be grown in a warm garden in the warmer areas of Britain[233]. Plants of the cultivar 'Southern Belle' have been seen growing outdoors at Kew Gardens, they are situated on a south-east facing wall of the Temperate House and have been there for at least 3 years as of 2000[K]. A very ornamental plant[1], there are many named varieties[200]. Special Features: North American native, Wetlands plant, Attracts butterflies

### 7.2.379 Clematis apiifolia

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Clematis apiifolia is a deciduous Climber growing to 5 m (16ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no reports of toxicity have been seen for this species, some if not all members of this genus are mildly poisonous. The toxic principle is dissipated by heat or by drying[65].

kcakta Edible Parts: LeavesEdible Uses: TeaYoung shoots - cooked and used as a vegetable[105, 177, 183]. Caution is advised, see the notes above on toxicity. The dried leaves are a tea substitute[105, 177]. The roasted leaves are used according to another report[183].

dwatta Carminative Digestive DysenteryAn infusion of the stems is used in the treatment of colic, dysentery, dyspepsia and sweating[218]. The plant is carminative and digestive[218]. It is also used in the treatment of dysentery[218].

nrakta E. Asia - China, Japan, Korea. ksacta Thickets in lowland and foothills, C. and S. Japan[58]. Forests, grassy slopes and along the sides of streams at elevations of 100 - 2300 metres in China[266].

propta Seed - best sown as soon as it is ripe in a cold frame [164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible [164]. A period of cold stratification is beneficial [164]. The seed germinates in 1-9 months or more at  $20^{\circ}{\rm c}[164].$  Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for the first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade and its shoots growing up to the light[164]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[11]. Succeeds in acid as well as alkaline soils[200]. A twining plant[182], it is fast-growing and is possibly best in the wild garden[202]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object it is touching[212]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes [54].

## 7.2.380 Pyracantha crenato

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Pyracantha crenato-serrata is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from September to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death.

kcakta Edible Parts: FruitEdible Uses: Fruit[177]. A famine food, it is only used when all else fails[177]. The fruit is about 5mm in diameter[266].

dwatta Febrifuge PoulticeA decoction of the leaves and/or the fruit is used in the treatment of fevers[147, 218]. The fresh leaves are crushed and applied externally to boils and abscesses[147, 218].

nrakta E. Asia - N. China. ksacta Hillsides, roadsides and waste places[147]. Thickets, streamsides and roadsides at elevations of 500 - 2800 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Remove all the fruit flesh since this can inhibit germination[200]. Stored seed requires 3 months cold stratification, sow it as early in the year as possible in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost mature wood, 5 - 10cm with a heel, mid-August in a cold frame[78]. Pot up in October or the following spring[78].

nwatta Prefers a good well-drained, moisture retentive loamy soil[1, 200]. Succeeds in any soil that is warm and not very heavy[11]. Another report says that it grows well in heavy clay soils. Succeeds in sun or part shade, though it does not fruit so well in a shady position[200]. Tolerates atmospheric pollution and reasonable exposure[200]. Susceptible to scab and fireblight[11], especially when grown on acid sandy soils[182]. Intolerant of root disturbance except

pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves raw[257].

tcanta Dye Hair ParasiticideYellow and green dyes are obtained from the flowering heads and pods[168]. Aromatic. A decoction of the roots has been used as a hair shampoo to kill lice[257].

dwatta Antispasmodic Blood purifier Demulcent Expectorant Parasiticide Sedative StomachicThe leaves and flowering tops are antiphlogistic, antispasmodic, balsamic, demulcent, expectorant, sedative, stomachic and a vascular tonic[4, 7, 21, 46, 61, 207, 213]. Blood purifier[4]. The plant is applied externally as a compress on inflamed or irritated areas of the skin[7, 257]. Used internally, it slows down the heartbeat and reduces the stimulation of the nerve endings in the air passages that causes coughing -it is therefore extremely effective as a calming agent in the treatment of asthma[7]. The fluid extract is prepared by placing the freshly gathered leaves and flowers in a small quantity of simmering water for about 15 minutes[213]. The plant is used to treat people affected by poison-ivy[213].

nrakta South-western N. America. ksacta By the coast[21] in sunny well-drained situations[200]. Thrives in dry areas and salty plains[7].

propta Seed - sow autumn or spring in a cool greenhouse and only just cover the seed. Prick out the plants into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta Succeeds in any well-drained soil in full sun[200]. Does well on dry sandy banks and in poor soils[200]. Plants tend to concentrate selenium in the leaves and stems, this is especially noticeable on soils that are relatively rich in that element[21]. Some authorities class this species as a synonym of G. camporum.

### 7.2.477 Eschscholzia californica

Californian Poppy

6 tlin 11 cyuc 1 kcak 2 tcan 3 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eschscholzia californica is a PERENNIAL growing to 0.3 m (1ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

pcista No records of toxicity have been seen but this species belongs to a family that contains many poisonous plants. Some caution is therefore advised.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[46, 61, 161]. This plant is in a family that contains many poisonous plants so some caution is advised in using it.

tcanta Perennial groundcover for zone 2 firebreaks. The US government has created a system of firebreaks for areas prone to wildfires, theses are separated into concentric zones surrounding buildings. Zone 2 is the second away from the house. These low-level groundcovers provide little fuel.

dwatta Anodyne Antianxiety Antidepressant Antispasmodic Diaphoretic Diuretic Galactofuge OdontalgicThe Californian poppy is a bitter sedative herb that acts as a diuretic, relieves pain, relaxes spasms and promotes perspiration[238]. The whole plant is harvested when in flower and dried for use in tinctures and infusions[238]. It is taken internally in the treatment of nervous tension, anxiety, insomnia and incontinence (especially in children)[238]. The watery sap is mildly narcotic and has been used to relieve toothache[238]. It is similar in its effect to the opium poppy (Papaver somniferum) but is much milder in its action and does not depress the central nervous system[238]. Another

report says that it has a markedly different effect upon the central nervous system, that it is not a narcotic but tends to normalize psychological function[254]. Its gently antispasmodic, sedative and analgesic actions make it a valuable herbal medicine for treating physical and psychological problems in children[254]. It may also prove beneficial in attempts to overcome bedwetting, difficulty in sleeping and nervous tension and anxiety[254]. An extract of the root is used as a wash on the breasts to suppress the flow of milk in lactating females[207, 257].

nrakta Western N. America - Washington to California and Nevada. A frequent garden escape in Britain. ksacta Grassy open places to 2000 metres in California[71].

propta Seed - sow in mid spring or late summer to early autumn in a sunny border outdoors and only just cover the seed[200]. Autumn sown plants may require protection from frosts in cold winters[200]. The seed usually germinates in 2-3 weeks.

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden. Prefers a poor sandy soil and a sunny position[108, 200] but is easily grown in an ordinary garden soil[1]. Succeeds in a hot dry position. Plants grow well in maritime climates[200]. A very ornamental plant, it is commonly grown in the flower garden and there are many named varieties[200]. This plant is the state flower of California[207]. Although a perennial it is usually quite shortlived and is more often grown as an annual in this country[187, 238]. It can tolerate temperatures down to about -10°c, however, and often survives mild winters[187]. If the dead flowers are removed before they set seed the plant will continue flowering for a longer period[188]. A polymorphic species[71]. Plants resent root disturbance and should be sown in situ[200]. The flowers are very attractive to bees[108]. They close during wet or overcast weather[238]. Plants often self-sow if the soil is disturbed by some means such as hoeing[200]. Special Features: Attractive foliage. North American native, Naturalizing, Suitable for cut flowers, Extended bloom season in Zones 9A and above. Heat Zone: 9-2

### 7.2.478 Micromeria iuliana

Savo

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Micromeria juliana is a deciduous Shrub growing to  $0.3 \,\mathrm{m}$  (1ft) by  $0.3 \,\mathrm{m}$  (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentLeaves are used as a food flavouring[183], a substitute for savory (Satureia spn.).

dwatta Diuretic KidneyUsed in the treatment of kidney and bladder ailments[148].

nrakta Europe - Mediterranean. ksacta Rocky places and other dry open habitats[45, 50].

propta Seed - sow spring in a greenhouse[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood with a heel, July/August in a frame[188].

nwatta Prefers an open position in a well-drained soil[1]. Succeeds in poor soils[200]. Requires a sunny position[188].

### 7.2.479 Inula britannica chinensis

Xuan Fu Hua

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

best planted about 45cm apart each way[208]. Strong growing bulbs such as some lilies will grow happily through this ground cover[K]. The plant can grow in very low moisture levels and has been used as a green covering on roofs[372]. Green roofs are incorporated into the structure of the building, providing habitats for wildlife as well as insulating the building and helping to improve the environment. The subspecies minima and the cultivars 'Athorum' and 'Coral Carpet' have been specifically mentioned in this respect.

dwatta Antiinflammatory PoulticeThe leaves and stems are applied externally as a poultice to inflammations and are especially recommended for treating painful haemorrhoids[4, 244].

nrakta Europe. Long naturalized in Britain. ksacta Rocks, walls, cobbled paths etc, in dry sunny situations on acid or calcareous soils[4, 17].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Alpine garden, Border, Container, Ground cover, Rock garden, Specimen. A very easily grown plant, it succeeds in most soils[188] but prefers a fertile well-drained soil[200]. Established plants are drought tolerant[190, 200], they grow well in dry soils and succeed on a wall[190]. Requires a sunny position[188]. Plants spread rapidly and aggressively at the roots[190]. If clearing the plant from an area it is quite important to try and remove every part of the plant since even a leaf or a small part of the stem, if left on the ground, can form roots and develop into a new plant[200]. This species has white flowers. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features: Attractive foliage, Not North American native, Invasive. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-

### 7.2.474 Paeonia japonica

Yama-Shakuyaku

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikl-

wis hpa7tmwatli fyifxre7t hjonli

drutta Paeonía japonica is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Flowers[177]. No further details are given. Young leaves - cooked[177]. Root - chewed[177].

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Diuretic Febrifuge SedativeThe root is analgesic, antibacterial, anti-inflammatory, antispasmodic, diuretic, febrifuge and sedative[174]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - Japan. ksacta Thickets and open deciduous woods in mountains, C. and S. Japan[58].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250]. nwatta Requires a deep rich soil, preferably neutral or

slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Closely related to P. obovata, this species is not easily cultivated in Britain and tends to be a poor doer here[200]. Plants offered under this name in British nurseries are often P. suffruticosa 'Japanese' [200]. Some botanists now treat this plant as no more than a form of P. lactiflora[250]. A very long-lived plant, specimens can survive in the garden for at least 50 years[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually selffertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 -5 years to flower from seed[200]. They generally breed true from seed[1].

#### 7.2.475 Navarretia squarrosa

Skunk Weed, Skunkbush

6 tlin 9 cyuc 1 kcak 2 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-

priklwis hpa7tmwatli xre7t hjonli

drutta Navarretia squarrosa is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - parched, ground into a powder and eaten dry[94]. It is very small and fiddly to use[K].

tcanta Dynamic accumulator.

nrakta Western N. America. ksacta Dry flats and fields in mixed woods below 800 metres in California[71].

propta Seed - sow early spring in situ[200].

nwatta Requires a very sunny position in a very well-drained dry to moist light or medium fertile soil[200].

#### 7.2.476 Grindelia robusta

Great Valley Gumweed

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Grindelia robusta is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to September. The species is hermaphrodite (has both male and female organs) and is

when young[11]. A good bee plant[108]. Birds are particularly attracted to the fruit of this plant[182]. Closely related to P. atalantioides and P. rogersiana[11, 200].

### 7.2.381 Weigela hortensis

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Weigela hortensis is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves - cooked[105, 177]. A famine food, they are only used when all else fails. A tea is made from the leaves[177].

nrakta E. Asia - C. and N. Japan. ksacta Common on sunny hills and mountains at elevations of 20 - 1800 metres[275].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame as soon as it is ripe if this is possible, otherwise in late winter or early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Softwood basal cuttings, 10 - 12cm long, in a sandy soil in a cold frame in early summer[200]. Cuttings of half-ripe wood, 8 - 10 cm with a heel, July/August in a frame[200]. Cuttings of mature wood of the current seasons growth. 20 cm long, November in a sheltered outdoor nursery bed[200].

nwatta An easily grown plant, succeeding in most fertile soils[11, 200]. Prefers a moist well-drained soil in sun or partial shade[200]. Tolerates atmospheric pollution[200]. Plants are very floriferous and can exhaust themselves, literally flowering themselves to death. The flowers are borne in the leaf nodes of the previous years growth and any pruning is therefore best done as soon as the plant has finished flowering[182]. The flowers have a soft sweet perfume[245]. Closely related to W. japonica[11]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.382 Ilex crenata

Japanese Holly, Box Leaved Holly 6 tlin 8 cyuc 1 kcak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ilex crenata is an evergreen Shrub growing to 5 m (16ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. No further details are given, but some caution is advised[K].The fruit is about 5mm in diameter[200].

tcanta Hedge HedgeVery amenable to trimming, this species is often grown as a hedge in N. America and Japan. It can also be used in topiary[182].

nrakta E. Asia - China, Japan, Korea. ksacta Thickets, woods and wet places in lowland and mountains all over Japan[58].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Landscape Uses:Border, Espalier, Foundation, Hedge, Massing, Seashore, Superior hedge. Succeeds in most soils so long as they are not water-logged[200]. Prefers a moist loamy soil[1]. Fairly slow growing. Plants are hardy to about -20°c[184]. A number of named varieties have been selected for their ornamental value[182]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Any transplanting is best done in May or, preferably, in September. Dioecious. Male and female plants must be grown if fruit and seed is required. Special Features:Not North American native, Inconspicuous flowers or blooms.

### 7.2.383 Buxus sempervirens

Box, Common box, American Boxwood 6 tlin 8 cyuc 1 kcak 0 tcan 2 dwat 5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli hjonli

drutta Buxus sempervirens is an evergreen Shrub growing to 5 m (16ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in leaf all year, in flower from April to May, and the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista All parts of the plant are poisonous, especially the leaves and bark[200].

kcakta Edible Parts: Edible Uses: CondimentThe leaves have been used in France as a substitute for hops (Humulus lupulus) in making beer[7]. They cannot be very wholesome, and would probably prove to be injurious[2].

tcanta Dye Hedge Hedge WoodBox makes an excellent hedge from 45cm to 4.5 metres tall according to the variety grown[11, 29]. It is quite slow growing but very tolerant of cutting and is often used in topiary, where the hedge is trimmed into different forms for ornamental effect[182]. The leaves and sawdust, boiled in lye, have been used to dye hair an auburn colour[4]. Wood - hard, close grained, heavy. Although the wood is rather small, it is highly valued on account of its hardness - it is twice as hard as oak (Quercus species][4, 268]. It is used for engraving, printing blocks, bowls, combs etc[4, 7, 11, 46, 100, 115, 178]. The root especially is much liked by turners and cabinet makers[7].

dwatta Alterative Antiperiodic Antirheumatic Cathartic Cholagogue Diaphoretic Epilepsy Febrifuge Homeopathy Leprosy Malaria Narcotic Odontalgic Oxytoxic Sedative Tonic VermifugeAlthough it has been used medicinally in the past as a sedative and to treat syphilis, box is very rarely used in modern herbalism[268]. The leaves and the bark are alterative, antirheumatic, cathartic, cholagogue, diaphoretic, febrifuge, oxytocic and vermifuge[4, 7, 9, 21, 178]. The leaves have been used as a quinine substitute in the treatment of malaria[7]. The leaves are harvested in the spring,

before the plant comes into flower, and they are dried for later use[238]. The bark can be harvested at any time of the year and is dried for use in decoctions[238]. Use this remedy with caution and preferably only under the supervision of a qualified practitioner. The plant has not been fully tested for its toxic side effects[7, 21]. The wood is diaphoretic, in full dose it is narcotic and sedative, in overdose it is convulsant and emetico-cathartic[4]. A tincture of the wood has been used as a bitter tonic and antiperiodic, it has also had a reputation for curing leprosy[4]. A volatile oil distilled from the wood has been prescribed in cases of epilepsy[4]. An essential oil obtained from the plant is used in dentistry[7]. A homeopathic remedy is made from the plant[7]. It is extensively used in the treatment of rheumatism[7].

nrakta Europe, including Britain, south and east from France and Germany to N. Africa and Albania. ksacta Beechwood and scrub, usually on chalk and limestone[17].

propta Seed - stratification is not necessary but can lead to more regular germination[113]. The seed is best sown in a cold frame as soon as it is ripe[138]. Sow stored seed as early in the year as possible in a cold frame. It usually germinates in 1 - 3 months at 15°c but stored seed can take longer[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of short side shoots with a heel, September in a frame[200]. High percentage[78]. Rather slow to root[K]. Nodal cuttings in spring in a frame. Fairly easy[200].

nwatta Landscape Uses: Container, Foundation, Screen, Woodland garden. Succeeds in almost any soil that is welldrained[11, 200], preferring light shade and chalky soils[9, 11. 28. 31]. Succeeds in dry shade[188]. Tolerates a pH range from 5.5 to 7.4[200]. A very hardy plant, tolerating temperatures down to at least -23°c, though it prefers milder winters[238]. A very polymorphic species, it is a very ornamental but slow growing plant[11] and there are many named varieties developed for their ornamental value[182] This species is notably resistant to honey fungus[88, 200]. A good bee plant[108]. Plants are very tolerant of being trimmed, they can be cut right back to the base if required and will usually resprout freely[11, 29]. The foliage is pungently scented, especially when wet[245]. Special Features: Attractive foliage, Not North American native, All or parts of this plant are poisonous. Inconspicuous flowers or blooms.

### 7.2.384 Tamarix anglica

English Tree

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hionli

drutta Tamarix anglica is a deciduous Shrub growing to 5 m (16ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy clay soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: MannaEdible Uses: A manna is produced by the plants in response to insect damage to the stems[2, 105]. It is sweet and mucilaginous[105].

tcanta Fuel Hedge Hedge Soil stabilization WoodVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens[7, 11, 49, 75]. Dislikes being trimmed[75]. The extensive root system of this plant makes it suitable for use in erosion control in sandy soils[149]. Wood fairly hard, not strong, close grained, takes a high polish. Used for general construction, poles, turnery[61, 149]. It makes a good fuel, burning well even when green due to the wax content of the wood[74].

dwatta Astringent DiureticAstringent, diuretic[7]. nrakta Western Europe in Britain, W. France, N.W. Spain and Portugal. ksacta Damp ground near the coast.

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the

greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11], plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. Growth can be restricted by cutting back the plants in spring, hedges are also best trimmed at this time[188]. This species is very closely related to T. gallica and is considered to be no more than a part of that species by many botanists[11, 200]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.385 Cornus australis

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cornus australis is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no reports of toxicity have been seen for this species, the following report refers to the closely related C. sanguinea. Contrary to some reports, the fruit is not poisonous, but the leaves can cause skin irritations to sensitive people[65].

kcakta Edible Parts: Fruit Oil OilEdible Uses: Oil OilThis species has the same uses as the closely related C. sanguinea[74]. These uses are listed below. Fruit - raw or cooked[105]. A bitter flavour, it can also have an emetic effect on the body[1, 7, 11]. It is not worthwhile[115]. The fruit is about 5mm in diameter[200]. An oil is obtained from the seed[2], it is edible when refined[75].

tcanta Basketry Charcoal Dye Fuel Hedge Hedge Oil Oil WoodThis species has the same uses as the closely related C. sanguinea[74]. These uses are listed below:- The seed contains 45% of a non-drying oil[74], it is used in soap making and lighting[7, 13, 100, 115, 177]. A non-drying oil is also obtained from the pericarp, it is used for lighting[74]. The pericarp contains 19 - 35% oil[74]. A greenish-blue dye is obtained from the fruit[13, 74]. The young stems are very flexible and are used in basketry[7, 13, 74, 100]. Woodtough, hard. Used for small items such as tool handles, turnery etc[11, 61, 115]. A good quality charcoal is obtained from the wood[115], the wood also makes an excellent fuel[115].

nrakta S.E. Europe to W. Asia. ksacta Limestone slopes in woodland in Turkey[93].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

female, but both sexes can be found on the same plant) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Poisonous[65, 76]. Most members of this genus are toxic to grazing animals and are usually avoided by them[222]. The seed also contains toxins[222].

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and young plants - cooked[2, 105, 177]. They must be thoroughly boiled and then washed[179]. Caution is advised, the plant is probably poisonous[218]. Seed - raw or cooked[212]. It can be used as a pinole[257]. The seed can be ground into a powder and mixed with flour for making bread, cakes etc[105, 257]. The seed contains about 36.7% protein, 38.6% fat, 5.2% ash[179]. It also contains a glycoside[179] and is probably poisonous.

tcanta Dye Essential Repellent TanninThe dried leaves are a source of tannin[145]. A yellow dye is obtained from the leaves[178]. The seed powder has been used as a blue body paint[257]. The dried plant repels weevils from stored wheat grain[178]. The seed contains an essential oil[272].

dwatta Anodyne Antibacterial Antifungal Antiperiodic Antirheumatic Antispasmodic Antitussive Appetizer Cytotoxic Diaphoretic Diuretic Emollient Febrifuge Hypoglycaemic Laxative Leprosy Malaria Sedative StomachicThe leaves and root are anodyne, antirheumatic, appetizer, diaphoretic, diuretic, emollient, laxative and sedative[61, 147, 178, 222]. The plant is considered to be useful in treating long-standing cases of malaria[240] and is used as an adulterant for Datura stramonium[61]. An infusion of the plant has been used in the treatment of rheumatism, diseased kidneys and tuberculosis[257]. It has also been used as a liniment on the armpits to reduce perspiration[257]. The fruits contain a number of medically active compounds including glycosides and phytosterols[279]. They are anodyne, antibacterial, antifungal, antimalarial, antirheumatic, antispasmodic, antitussive, cytotxic, hypoglycaemic and stomachic[238, 279]. They are used internally in the treatment of allergic rhinitis, sinusitis, catarrh, rheumatism, rheumatoid arthritis, constipation, diarrhoea, lumbago, leprosy and pruritis[238, 257]. They are also used externally to treat pruritis[238]. The fruits are harvested when ripe and dried for later use[238]. The root is a bitter tonic and febrifuge[240]. It has historically been used in the treatment of scrofulous tumours[222]. A decoction of the root has been used in the treatment of high fevers and to help a woman expel the afterbirth[257]. A decoction of the seeds has been used in the treatment of bladder complaints[257]. A poultice of the powdered seed has been applied as a salve on open sores[257].

nrakta A cosmopolitan plant, a locally established casual in Britain[17]. ksacta River banks, lake shores, cultivated ground and pastures[50].

propta Seed - sow spring or autumn in situ[238]. The seed requires plenty of moisture in order to germinate.

nwatta Requires a sunny position, succeeding in most soils. Prefers a poor dry soil[238]. Hardy to about - 15°c[238]. Plants often self sow and in some parts of the world have become noxious weeds[238].

### 7.2.472 Polypodium glycyrrhiza

Licorice Fern

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Polypodium glycyrrhiza is a FERN growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. The seeds ripen from November to March. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

pcista Although we have found no reports of toxicity for this species, a number of ferns contain carcinogens so some caution is advisable[200]. Many ferns also contain thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people eating an adequate diet that is rich in vitamin B, though large

quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172].

kcakta Edible Parts: RootEdible Uses: Root - raw or cooked[257] The root is sweetly liquorice-flavoured but is thin and fibrous and virtually inedible[200]. The root was commonly chewed for its very pleasant flavour by many native North American Indian tribes[256, 257]. It was often used as an appetiser, especially for children who would not eat[256]. Apart from its used as a pleasantly flavoured chew, it was seen as a famine food and was only used when there was a shortage of better foods[177, 257].

dwatta Alterative Carminative Haemostatic PectoralLiquorice fern was employed medicinally by several native North American Indian tribes who used it especially as a treatment for a variety of chest complaints[257]. It is little, if at all, used in modern herbalism. The rhizomes are alterative, carminative, haemostatic and pectoral[257]. The raw rhizomes have been eaten, or an infusion has been used, in the treatment of coughs and colds, chest pains, shortness of breath and VD[257]. The roots have been chewed, and the juice swallowed, as a treatment for sore throats and the spitting or vomiting of blood[257]. A tea of the pounded boiled rhizomes, mixed with fir needles, has been used to treat measles[213]. Coughs have been treated by chewing and slowly swallowing the juice of the roasted rhizome[213]. The roots have been used in the treatment of colds and sore throats[256].

nrakta Western N. America - Alaska to California. ksacta Rocks, mossy tree trunks, logs etc, below 600 metres in coniferous and mixed forests in California[71]. Cliffs and rocky slopes along coasts, often epiphytic, on a variety of substrates[270].

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division in spring[200].

nwatta Tolerates short periods of drought and direct sunlight, but it prefers bright filtered light[200]. Plants can be grown on a drystone wall[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. There are several named varieties selected for their ornamental value[200]. Polypodium glycyrrhiza hybridizes with P. calirhiza and with P. hesperium to produce sterile triploids with misshapen spores[270]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

### 7.2.473 Sedum album

Small Houseleek, White stonecrop, Sedum, Stonecrop 6 tiin 8 cyuc 1 kcak 3 tcan 1 dwat 0.1 m hkuc htut cyutli hgatkyuctcup hwicii hyishrasjlutnyik hpa7tli flatpriklwis hpa7tlmwatli fvifxre7t hionli

drutta Sedum album is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 46, 52, 100]. Usually eaten as a pickle[4], though it can also be added to salads or cooked with other leafy vegetables[244].

tcanta Agroforestry Uses: The plant spreads aggressively and can be used for ground cover in a sunny position amongst plants tall enough not to be overrun by it. It is

male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young leaves - cooked[105, 177]. Root - cooked[105, 177].

nrakta E. Asia - C. and S. Japan. ksacta Woods in the mountains [58].

propta Seed - best surface sown as soon as it is ripe in a greenhouse [200]. Do not allow the compost to dry out. Germination usually takes place within 1 - 2 months at  $18^{\circ}$ c[175]. Surface sow stored seed in early spring. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When large enough, plant them out in early autumn or in spring. Division in spring[188].

nwatta Requires a cool rich well-drained peaty soil with shelter from the wind[1, 175]. Intolerant of drought[1]. Requires shade, at least from the morning sun, in spring and autumn[175]. A slow-growing plant[188], it does well in a rock garden[188].

### 7.2.468 Chamaedaphne calyculata

Leather Leaf

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Chamaedaphne calyculata is an evergreen Shrub growing to 0.8 m (2ft 7in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

pcista A toxin, called 'andromedotoxin' can be released from the plant if it is infused in boiling water[183]. See notes below regarding use of the plant for tea.

kcakta Edible Parts: Edible Uses: TeaAn aromatic tealike beverage is brewed from the fresh or dried leaves[161, 177, 183, 257]. Some reports say that boiling or steeping can extract a harmful toxin 'andromedotoxin' and it is recommended that the leaves are put in a jar of water and left in a sunny position to brew in order to make 'sun-tea'[183].

dwatta Antiphlogistic FebrifugeA poultice of the leaves has been applied to inflammations[257]. An infusion of the leaves has been used to treat fevers[257].

nrakta Europe, Asia, N. America. ksacta Peaty swales, bogs, pine barrens, pond margins etc[43].

propta Seed - sow February in a lime-free compost in a greenhouse and only just cover the seed[78]. Do not allow the compost to dry out and keep the pot in a shady position. Germination is usually fair, taking 1 - 12 months at 15°c, though 4 weeks cold stratification may reduce this time[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts[164]. Cuttings of almost ripe side-shoots, 4 - 5cm long with a heel, August in a frame. A variable degree of success[78]. It can help to prune the plants lightly after flowering in order to encourage vigorous growth from which to take the cuttings[78]. Layering in August. Takes 18 months. High percentage[78].

nwatta Thrives in a moist well-drained lime-free soil in sun or semi-shade[1, 200]. Best if given some protection from the midday sun[1]. Plants are hardy to about 25°c[184]. There are some named forms, selected for their ornamental value. 'Nana' is a dwarf compact form that is good for shady areas[183]. The flowers have a delicate refreshing scent[245].

### 7.2.469 Lysimachia fortunei

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli drutta Lysimachia fortunei is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.4 m (1ft 4in). See above for USDA hardness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: LeavesEdible Uses: CondimentThe young plant is edible[177, 179]. No more details are given. The leaves are also used as a condiment[46, 61, 177].

nrakta E. Asia - China, Japan. ksacta Wet margins of rivers and ponds in the lowland of C. and S. Japan[58]. Wet areas, ditches, banks of rice paddies and roadsides from sea level to 1500 metres[266].

propta Seed - sow autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, succeeding in a moist loamy soil[1]. Judging by its native habitat, it should succeed in shallow water. Grows well in heavy clay soils. Most species in this genus seem to be immune to the predations of rabbits[233].

#### 7.2.470 Ranunculus californicus

California Buttercup

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ranunculus californicus is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista Although no specific record of toxicity has been found for this plant, many if not all members of this genus are poisonous. These toxins can be destroyed by heat or by drying[4, 10, 13, 19, 62, 65]. Many if not all plants in this genus also have a strongly acrid juice that can cause blistering to the skin[65, 183].

kcakta Edible Parts: SeedEdible Uses: Seed cooked[257]. It is usually ground into a powder and can then be used as a mush with water, a flavouring in soups, or mixed with cereals when making bread etc[105, 161, 257].

nrakta South-western N. America - Oregon to S. California.. ksacta Grassy bluffs by the coast[60]. Grassland and open woodland from sea level to 2000 metres[270].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a moist loamy soil[1]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 7.2.471 Xanthium strumarium

Cocklebur, Rough cocklebur, Canada cocklebur 6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 0.8 m hkuc htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Xanthium strumarium is a ANNUAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to October, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[[188]. This species is closely related to C. sanguinea[11]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.386 Cocculus orbiculatus

Queen coralbead

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 4 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Cocculus orbiculatus is a deciduous Climber growing to 4 m (13ft 1m). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - cooked. An emergency food, it is used when all else fails[177]. One report says that the root might be edible[177].

tcanta Basketry InsecticideThe bleached tendrils are used as an ornamental infill in basket making[46, 61]. The plant contains cocculoidine which has insecticidal activity[218].

dwatta Anodyne Antiasthmatic Antiphlogistic Antirheumatic Carminative Depurative Diuretic VermifugeThe root is anodyne, antiphlogistic, antirheumatic, carminative, depurative, diuretic and vermifuge[147, 176, 218]. It is used in the treatment of rheumatic arthritis, oedema and oliguria[176]. It has also shown antibacterial and anti-amoebic activity[176]. A decoction of the stems is used in the treatment of asthma, bronchitis and paralysis[218].

nrakta E. Asia - China, Japan. ksacta Sides of streams, to 1000 metres in W. China[109]. Sparse forests, bushes, village sides and forest edges in most regions of China[266].

propta Seed - we have no details for this species but suggest sowing the seed as soon as it is ripe in a greenhouse. Sow stored seed as soon as possible in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer, after the last expected frosts. Root cuttings in December in a greenhouse[200]. Division in the dormant season. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Easily cultivated in an ordinary garden soil[1], it prefers a well-drained moisture retentive fertile soil in full sun or semi-shade[200]. Plants only fruit well when grown in full sun[219]. This species is hardy to about -10°c[200]. Plants climb by means of twining around supports[219]. They do not normally require pruning[219]. Closely related to C. carolinus[200].

#### 7.2.387 Cornus poliophylla

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cornus poliophylla is a deciduous Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The following notes are for C. macrophylla, they quite probably also apply to this closely related species[K]. Fruit - raw or cooked[2, 105, 146, 158, 200, 218]. The fruit is about 6mm in diameter[200].

tcanta WoodThe following notes are for C. macrophylla, they quite probably also apply to this closely related

species[K]. Wood - hard, close grained, warps badly[158]. It makes a good charcoal[146, 158].

dwatta Anodyne Astringent Dysentery TonicThe following notes are for C. macrophylla, they quite probably also apply to this closely related species[K]. Anodyne, astringent, tonic[178]. The wood is anodyne and a uterosedative[218]. The stem bark is used in the treatment of dysentery[218].

nrakta E. Asia - W. China. ksacta Dense and sparse forests, open hillsides at elevations of 1100 - 3200 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 1131. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[[188]. This species is closely related to C. monbeigii[11, 200]. Plants in this genus are notably resistant to honey fungus[200].

### 7.2.388 Pyracantha coccinea

Firethorn, Scarlet firethorn, Pyracantha, Firethorn 6 tlin 9 cyuc 1 kcak 3 tcan 0 dwat 4 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Pyracantha coccinea is an evergreen Shrub growing to 4 m (13ft) by 4 m (13ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semishade (light woodland) or no shade. It prefers moist soil. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death.

kcakta Edible Parts: FruitEdible Uses: Fruit - cooked Used for making jellies, marmalade and sauces[15, 183].

tcanta Hedge HedgeLandscape Uses: Erosion control, Espalier, Massing, Seashore. Tolerant of trimming and of reasonable exposure, it can be grown as a hedge[49, 200]. It forms a very spiny barrier[200].

nrakta S. Europe. Occasionally found more or less naturalized in Britain[17]. ksacta Woods and hedges[89].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Remove all the fruit flesh since this can inhibit germination[200]. Stored seed requires 3 months cold stratification, sow it as early in the year as possible in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the

10cm with a heel, mid-August in a cold frame[78]. Pot up in October or the following spring[78].

nwatta Prefers a good well-drained, moisture-retentive loamy soil[1, 200]. Succeeds in any soil that is warm and not very heavy[11]. Another report says that it grows well in heavy clay soils. Succeeds on chalky soils[108]. Succeeds in sun or part shade[200] and also on a shady wall[28, 49], though it does not fruit so well in a shady position[200]. Tolerates atmospheric pollution and reasonable exposure[200]. A very ornamental plant[1], there are a number of named varieties[11, 200]. Susceptible to scab and fireblight[11], especially when grown on acid sandy soils[182]. This species, especially the cultivar 'Lelandii', is notably resistant to honey fungus[200]. Intolerant of root disturbance except when young[11]. A good bee plant[108]. Birds are particularly attracted to the fruit of this plant[200]. Special Features: Not North American native, Attractive flowers or blooms.

### 7.2.389 Euonymus japonicus

Japanese Spindle Tree, Box-leaf Euonymus, Evergreen Euonymus, Japanese Euonymus

6 tlin 9 cvuc 1 kcak 0 tcan 1 dwat 4.5 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Euonymus japonicus is an evergreen Shrub growing to 4.5 m (14ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

pcista The seed is probably poisonous, other parts of the plant may also be poisonous[65].

kcakta Edible Parts: LeavesEdible Uses: ColouringYoung leaves - boiled[2, 177, 183]. The old leaves are powdered and used to colour food[105, 177, 183]. These reports should be treated with some caution due to the report of toxicity - see above.

tcanta Hedge Hedge LatexRoots and stems yield up to 7% gutta-percha, a non elastic rubber used as an electrical insulator and in making plastics etc[61, 74, 103]. Can be grown as a hedge, it is very tolerant of trimming and succeeds in severe maritime exposure[11, 75, 200].

dwatta Antirheumatic Diuretic Tonic Women's complaintsThe stem bark is antirheumatic, diuretic and tonic[218]. The leaf is used in cases of difficult delivery[218]. nrakta E. Asia - Japan. Locally naturalized in S. Eu-

rope. ksacta Slopes in thickets and woods, especially near the sea[58]

propta Seed - best sown as soon as it is ripe in a cold frame[121]. Stored seed requires 3 months cold stratification, so should be sown as early in the year as possible in a cold frame[113]. Seed can take 18 months to germinate[74]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 7cm long taken at a node or with a heel, July/August in a frame. Very easy[200]. Cuttings of mature wood, October in a frame78, 1131. Cuttings will root readily at any time of the year if given bottom heat[1]. Root cuttings in winter.

nwatta Landscape Uses:Border, Container, Foundation, Hedge, Massing, Screen, Specimen, Woodland garden. Thriving in almost any soil, including chalk and sandy soils, it is particularly suited to dry shaded areas[200]. Grows well in heavy clay soils. Shade tolerant but does not fruit well in such a position[11]. Prefers a well-drained loamy soil[11]. Plants are very tolerant of maritime exposure, succeeding even when grown on the sea shore[166], but they can be killed by cold drying winds[75, 184]. A very ornamental plant[1], there are a number of named varieties[184]. It is only hardy in S. England[11] tolerating temperatures down to about -10°c[184]. Plants are more likely to succumb to the cold if they are regularly trimmed (this exposes young growth

last expected frosts. Cuttings of almost mature wood, 5 - to the cold), this regular trimming also leads to mildew especially when plants are growing in very dry ground[182]. The Japanese spindle tree is cultivated in Russia and Spain for the latex contained in the root. It is best grown in a dry soil and an open position when being grown for its latex[61, 74]. Plants are often slow to get established. Plants can be susceptible to attacks by caterpillars[182] and are often damaged during the flowering season[11]. They are also a host of the sugar beet fly[49]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, Naturalizing, Inconspicuous flowers or blooms.

#### 7.2.390 Pyracantha angustifolia

Narrowleaf firethorn, Pyracantha 6 tlin 10 cyuc 1 kcak 3 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Pyracantha angustifolia is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even

kcakta Edible Parts: FruitEdible Uses: Fruit[15]. No more details are given but the fruit is unlikely to be that inspiring, particularly when it is said that this is the least interesting fruit of the genus for birds![K]. The fruit is about 5 6mm in diameter[266].

tcanta ShelterbeltLandscape Uses: Erosion control, Espalier, Massing, Seashore. A fairly wind-tolerant shrub, it can be used in shelterbelt plantings[200].

nrakta E. Asia - S.W. China. ksacta Thickets on slopes. at roadsides at elevations of 1600 - 3000 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Remove all the fruit flesh since this can inhibit germination[200]. Stored seed requires 3 months cold stratification, sow it as early in the year as possible in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost mature wood, 5 -10cm with a heel, mid-August in a cold frame[78]. Pot up in October or the following spring[78].

nwatta Prefers a good well-drained, moisture-retentive loamy soil[1, 200]. Succeeds in any soil that is warm and not very heavy[11]. Another report says that it grows well in heavy clay soils. Succeeds on chalky soils[108]. Succeeds in sun or part shade, though it does not fruit so well in a shady position[200]. Tolerates atmospheric pollution and reasonable exposure[200]. Plants are not reliably hardy in the colder areas of Britain[219]. Susceptible to scab and fireblight[11], especially when grown on acid sandy soils[182]. Birds are less attracted to the fruit of this species than they are to other members of the genus[182]. Special Features: Not North American native, Attractive flowers or blooms.

hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root cooked[105, 177].

nrakta E. Asia - Himalayas from Pakistan to S.E. Tibet. ksacta Open slopes in dry areas[51]. Stony slopes of mountain streams, pebbles, clayey, stony and sometimes sandy mountain slopes[74].

propta Seed - sow in an outdoor seedbed in April/May. The seed usually germinates in 1 - 4 weeks at 15°c[175]. If seed is in short supply then we would recommend sowing it in a pot in a cold frame, potting it up as soon as it is large enough to handle and growing it on in the frame for the first winter, planting out in late spring. Division in spring or autumn[200]. Basal cuttings in April/May[1, 200]. Harvest the shoots when they are about 10 - 15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Grows best in a sunny position in a fertile welldrained soil according to some reports[200, 245] whilst other reports say that it prefers a cool position and some shade[1] 175]. Prefers some shelter and a moist but not wet soil[175].

### 7.2.464 Conradina verticillata

Cumberland Rosemary

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc

htut cyutli tcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli

drutta Conradina verticillata is a deciduous Shrub growing to 0.3 m (1ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) soils and prefers welldrained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe leaves have a strong pleasant scent, reminiscent of rosemary, and are used as a rosemary substitute as a flavouring in cooking[183].

nrakta South-eastern N. America - Tennessee. ksacta Not known

propta Seed - sow spring in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer, after the last expected frosts. Cuttings of new shoots in spring in a frame[200].

nwatta Requires a light soil and a very sunny position[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This is an endangered species in the wild[183].

### 7.2.465 Carex kobomugi

Japanese sedge

6 tlin 8 cyuc 1 kcak 2 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Carex kobomugi is a PERENNIAL growing to 0.2 m (Oft 8in). See above for USDA hardiness. It is hardy to UK zone 6. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Root SeedEdible Uses: Root cooked[172]. Seed[172]. An emergency food, used when all else fails[177]. The seed is very small and would be fiddly to

tcanta Environmental Uses: Land reclamation; Landscape improvement; Soil conservation. Possible benefits in using C. kobomugi for dune stabilization in its native range. but there are considerable doubts raised about its relative effectiveness compared to native species outside of this range.

nrakta E. Asia - Japan, Korea, Manchuria. ksacta Sand dunes along the seacoast all over Japan[58].

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°c[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in most parts of this country. It is likely to tolerate maritime exposure[K]. The following notes are based on the general needs of the genus. Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### **7.2.466** Iberis amara

Rocket Candytuft, Annual candytuft 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.3 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Iberis amara is a ANNUAL growing to 0.3 m (1ft) by 0.2 m (Oft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe seeds are sometimes used as a source of mustard[61, 177, 183]. Pungency of mustard develops when cold water is added to the ground-up seed - an enzyme (myrosin) acts on a glycoside (sinigrin) to produce a sulphur compound. The reaction takes 10 - 15 minutes. Mixing with hot water or vinegar, or adding salt, inhibits the enzyme and produces a mild bitter mustard[238].

dwatta Antiarrhythmic Antiasthmatic Antirheumatic Antiscorbutic HomeopathyLittle used in modern herbalism. rocket candytuft is a bitter-tasting tonic, aiding digestion and relieving wind and bloating[254]. It is traditionally taken to treat gout, rheumatism and arthritis[254]. All parts of the plant are antirheumatic and antiscorbutic[61]. The seeds are considered very useful in the treatment of asthma, bronchitis and dropsy[4, 240]. The plant is gathered in the summer and can be dried for later use[254]. The seeds are harvested when fully ripe[254]. A common homeopathic remedy is made from the seeds[4].

nrakta Western and southern Europe, including Britain, to N. Africa, ksacta Dry calcareous soils on hillsides and in cornfields[17].

propta Seed - sow spring in situ for summer flowering or late summer in situ for a spring flowering[200]. The seed germinates within 3 weeks.

nwatta Easily grown in a good, well-drained ordinary garden soil in a sunny position[1]. Prefers a calcareous soil but tolerates mildly acid soils[1]. Succeeds in poor soils[200] and on dry walls[1]. A very ornamental plant[1]. A fast growing plant[188], do not grow the plants too close together[1]. The flowers are sweetly scented[245].

#### 7.2.467 Deinanthe bifida

6 tlin 9 cvuc 1 kcak 0 tcan 0 dwat 0.4 m hkuc pcimhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Deinanthe bifida is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both

pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista This plant should not be used during pregnancy prior to the commencement of labour[165]. Excessive doses may cause high blood pressure and symptoms similar to nicotine poisoning. Overdose may cause nausea, vomiting, incoordination and narrowing of blood vessels to the heart muscles. Powdered root can have an irritant effect on nucous membranes [301]. Contraindicated in patients with ischaemic heart disease (angina and heart attacks) and in patients with high blood pressure [301].

kcakta Edible Parts: Edible Uses: CoffeeThe roasted seed is a coffee substitute[4, 102, 105, 177]. The seeds are about the size of large peas, but are not produced in abundance[232].

dwatta Anthelmintic Antispasmodic Birthing aid Diaphoretic Diuretic Emmenagogue Oxytoxic SedativePapoose root is a traditional herb of many North American Indian tribes and was used extensively by them to facilitate child birth[207]. Modern herbalists still consider it to be a woman's herb and it is commonly used to treat various gynaecological conditions[254]. An acrid, bitter, warming herb, it stimulates the uterus, reduces inflammation, expels intestinal worms and has diuretic effects[238]. The root is anthelmintic, antispasmodic, diaphoretic, diuretic, emmenagoque, oxytocic and sedative[4, 21, 46, 165, 207]. An infusion of the root in warm water is taken for about 2 weeks before the expected birth date in order to ease the birth[207, 213]. This infusion can also be used as an emmenagogue and a uterine stimulant[213]. Papoose root should therefore be used with some caution by women who are in an earlier stage of pregnancy since it can induce a miscarriage or early deliverv[222]. The plant is also taken internally in the treatment of pelvic inflammatory disease, rheumatism and gout[238]. It should not be prescribed for people with hypertension and heart diseases[238]. The powdered root can have an irritant action on the mucous membranes, therefore any use of this plant is best under the supervision of a qualified practitioner[238, 268]. The roots are normally harvested in the autumn, because they are at their richest at this time[213], and are dried for later use. The root is harvested in early spring as new growth is beginning and is used to make a homeopathic remedy[232]. It is used especially in childbirth and in some forms of rheumatism[232].

nrakta Eastern N. America - New Brunswick to South Carolina, Arkansas, North Dakota and Manitoba. ksacta Rich moist soils in swamps, by streams[4, 21] and in woods[43].

propta Seed - best sown as soon as it is ripe in a shady part of a cold frame[200]. If stored seed is used, it should be sown as soon as it is received. Germination can be erratic. Prick out the seedlings as soon as they are large enough to handle and grow them on in a shady part of a greenhouse or cold frame for at least their first winter. Plant them out into their permanent positions during autumn or early winter. Division in spring or just after flowering[200]. Plants are slow to increase[187].

nwatta Easily grown in a damp light humus-rich woodland soil preferring a position in deep shade[1, 200]. One report says that it is best in a peat garden. Plants are hardy to at least -20°c[187]. The plant only produces one large leaf each year[233]. The seeds rupture the ovary before they are fully ripe and continue to expand naked, they are bright blue when fully ripe[130].

#### 7.2.461 Cardamine trifolia

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fvifxre7t hionli

drutta Cardamine trifolia is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to June, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: We have no information on this species but the leaves are almost certainly edible either raw or cooked[K].

tcanta An excellent ground cover for woodland or under shrubs[208]. Plants should be spaced about 30cm apart each way[208].

nrakta C. and S. Europe. An occasional garden escape in Britain. ksacta Moist shady woods, especially on calcareous substrata[17].

propta Seed - sow spring in a cold frame. Germination usually takes place within 1 - 3 weeks at 15°c[175]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse or cold frame for the first two years, planting them out when dormant in late summer. Division in early spring or after the plant dies down in the summer. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in most soils so long as they are not dry[1]. Prefers a moist humus rich soil in shade or semi-shade[200]. A mat-forming stoloniferous species[200].

#### 7.2.462 Sedum sarmentosum

stringy stonecrop

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.1 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum sarmentosum is an evergreen Perennial growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista Although not poisonous, if large quantities of this plant are eaten it can cause a stomach upset[62, 85].

kcakta Edible Parts: LeavesEdible Uses: Young leaves and stems - raw or cooked[105, 177]. Used as a veg-

dwatta Used medicinally[266]. No further information is given[266].

nrakta E. Asia - China, Japan, Korea. ksacta Shady places and rocks on slopes below elevations of 1600 metres in China[266].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

# 7.2.463 Dracocephalum heterophyllum

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli drutta Dracocephalum heterophyllum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is

### 7.2.391 Coprosma rugosa

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma rugosa is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to February, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Freely produced in Britain, it is sweet but with little flavour[225]. The fruit is white or blue and about 8mm long x 6mm wide[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta Dye Hedge Hedge Tolerant of heavy trimming, the plant makes a good hedge [225]. A yellow dye is obtained from the wood it does not require a mordant [153]

nrakta New Zealand. ksacta Lowland to montane and lower sub-alpine grassland, shrubland and forest margins in North and South Islands[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the mildest areas of Britain[200]. Another report says that it is quite hardy in Britain[225]. Hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

### 7.2.392 Alangium platanifolium

Alangium

6 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Alangium platanifolium is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

tcanta InsecticideThe leaves and the bark of the root are used as an insecticide[178]. The leaves and stem bark according to another report[218].

dwatta AntirheumaticThe root is used in the treatment of rheumatism and other bone diseases[218].

nrakta E. Asia - China, Japan. ksacta Woodland thickets, 1200 - 2100 metres in W. China[109].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in the spring. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in early summer and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood, July/August in sand in

a frame[200]. Users feedback: I collected the seeds in late summer, stored them at a dark and dry location and followed a normal stratification procedure from November till January (November and January at around 2 °C, December at around -12 °C, all in my fridge). Germination appears to start at the earliest after three weeks, how long it usually takes I will know in a couple of weeks (it's just one early bird that broke through the surface today).

Luckily, no trickery is required: it's sufficient to clean them up, soak them in water before and after stratification and pop them into the moist soil. OW

nwatta Succeeds in any moderately fertile well-drained soil[200]. Requires full sun and a sheltered position[182, 200]. A fairly hardy plant[1], but it does not succeed outdoors at Kew, the soft pithy shoots being cut back by winter cold[11]. It grows well in Gloucestershire[11, 182]. This species is closely related to A. chinense[200].

### 7.2.393 Sasamorpha borealis

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sasamorpha borealis is an evergreen Bamboo growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. It is used as a cereal[177]. The seed is only produced at intervals of several years.

nrakta E. Asia - China, Japan, Korea. ksacta Woodlands and damp hollows all over Japan[58, 200].

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°c. Stored seed is best sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 -6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse until large enough to plant out, which could be a few years. Plants only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200].

nwatta Requires a good humus rich loam with ample moisture in the growing season[200]. Prefers partial shade, growing well in thin woodland. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rhizome is gently running. This species is liable to be mistaken for Pseudosasa iaponica[200].

### 7.2.394 Artemisia annua

Qing Hao, Sweet sagewort 6 tlin 9 cyuc 1 kcak 2 tcan 4 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Artemisia annua is a ANNUAL growing to 3 m (9ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil

and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista Skin contact with the plant can cause dermatitis or other allergic reactions in some people[222]. The pollen is extremely allergenic[269].

kcakta Edible Parts: Edible Uses: CondimentAn essential oil in the leaves is used as a flavouring in spirits such as vermouth[269].

tcanta Essential Herbicide MiscellanyThe plant is used in China as a medium for growing Aspergillus which is used in brewing wine. The substances mentioned above in the medicinal uses, used in the treatment of malaria, also show marked herbicidal activity[222]. The plant yields 0.3% essential oil[240]. This has an agreeable, refreshing and slightly balsamic odour and has been used in perfumery[240].

dwatta Antibacterial Antiperiodic Antiseptic Carminative Digestive Febrifuge Malaria MiscellanyQing Ho, better known in the West as sweet wormwood, is a traditional Chinese herbal medicine. An aromatic anti-bacterial plant, recent research has shown that it destroys malarial parasites, lowers fevers and checks bleeding[238, 254, 279]. It is often used in the Tropics as an affordable and effective antimalarial[254]. The leaves are antiperiodic, antiseptic, digestive, febrifuge[176, 178]. An infusion of the leaves is used internally to treat fevers, colds, diarrhoea etc[222, 254]. Externally, the leaves are poulticed onto nose bleeds, boils and abscesses[222, 238]. The leaves are harvested in the summer, before the plant comes into flower, and are dried for later use[254]. The plant contains artemisinin, this substance has proved to be a dramatically effective anti-malarial against multi-drug resistant Plasmodium spp[218, 238, 254, 269]. Clinical trials have shown it to be 90% effective and more successful than standard drugs[254]. In a trial of 2000 patients, all were cured of the disease[218]. The seeds are used in the treatment of flatulence, indigestion and night sweats[222].

nrakta S. E. Europe to W. Asia. ksacta Occurs naturally as part of a steppe vegetation in the northern parts of Chahar and Suiyuan provinces in China, at 1000 to 1500 m above sea level[269].

propta Seed - sow spring in a cold frame and plant out in late spring or early summer. Alternatively, the seed can be sown late spring in situ.

nwatta An easily grown plant, succeeding in a welldrained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. A fast-growing annual plant, it is tall but neat in habit with a handsome fragrant foliage and is useful for filling gaps at the back of a border[238]. It has become a weed of waste places in many areas of the world[43]. The plant is extremely vigorous and essentially disease and pest free[269]. Qing Hao is a determinate short-day plant. Nonjuvenile plants are very responsive to photoperiodic stimulus and flower about two weeks after induction. The critical photoperiod seems to be about 13.5 hours, but there are likely to be photoperiod x temperature interactions. In Lafayette Indiana, USA (40°21'N) plants flower in early September with mature seeds produced in October. The plant is not adapted to the tropics because flowering will be induced when the plants are very small[269]. Most collections of artemisia derive from natural stands with highly variable artemisinin content, some as low of 0.01%. Selections from Chinese origin vary from 0.05 to 0.21%. Swiss researcher N. Delabays reports a clonal selection derived from Chinese material which produces 1.1% artemisin but is very late flowering; proprietary hybrids have been obtained with somewhat lower content but flower earlier[269]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.395 Vaccinium sprengelii

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium sprengelii is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and

medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw or cooked[177]. The fruit is about 5mm in diameter[200]. Leaves[177]. No more details are given.

nrakta E. Asia - China to the Himalayas. ksacta Woods, streamsides and thickets, 1300 - 1600 metres in W. Hupeh[109]. Mixed forests, pine forests and thickets at elevations of 2300 - 2700, occasionally to 3200 metres[266].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free sol, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. A polymorphic species[109], it is closely related to V. duclouxii[182]. Plants are deciduous in cold climates[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.396 Ilex coriacea

Large Gallberry

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta llex coriacea is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen in October. The species is diocious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

kcakta Edible Parts: FruitEdible Uses: Fruit[43]. No more details are given but I would have some doubts on the wholesomeness of the fruit[K]. The fruit is about 6 - 10mm in diameter[200].

nrakta South-eastern N. America - Florida to Louisiana, north to S.E. Virginia. ksacta Low wet areas such as swamps, bays, river floodplains, and by the sides of streams and ponds[229]. Sandy woods and swamps[43].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not

### 7.2.457 Corydalis incisa

Incised fumewort

6 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Corydalis incisa is a ANNUAL/BIENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pft: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

pcista Although no specific mention has been seen for this species, there is a report that Corydalis species are potentially toxic in moderate doses[222].

kcakta Edible Parts: LeavesEdible Uses: Young plant-cooked in spring[177, 178, 179]. Slightly deleterious[178].

dwatta MiscellanyThe dried and powdered flowers are used in the treatment of rectal collapse[218]. An aqueous decoction of the plant is used in the treatment of abscesses[218]. Used in China and Japan in folk medicine to treat inflammation, headaches, skin diseases, and other ailments [1-7].

nrakta E. Asia - China, Japan, Korea. ksacta Thickets and bamboo forests in lowland and foothills all over Japan[58]. Grows in marshes[178]

propta Seed - best sown as soon as it is ripe, the seed rapidly loses viability if it is allowed to become dry[129]. Surface sow and keep moist, it usually germinates in 1-3 months at 15°c[164]. Germinates in spring according to another report[129]. Two months warm, then a cold stratification improves the germination of stored seed[134, 164]. Seedlings only produce one leaf in their first year of growth[175] and are very prone to damping off[129]. This species is a biennial and probably germinates more easily than the perennial species.

nwatta Can be invasive outside its natural range. Corydalis incisa is an annual or biennial, spring-ephemeral herb. Seeds germinate in the spring and develop small rosettes. which wither during the summer. They emerge again as rosettes throughout the winter and produce compact flowering racemes the following spring [1-7]. In its native range in Asia, C. incisa occurs along stream valleys, irrigation channels, and forest margins; in wastelands, roadsides, and forestlands; and on rock walls. In the United States, it grows in mesic and alluvial forest habitats. Under horticultural conditions, C. incisa prefers cooler exposures [1-7]. The known distribution globally has Plant Hardiness Zones 6-10, areas with 20-100+ inches of annual precipitation, and the following Köppen-Geiger climate classes: humid subtropical, marine west coast, humid continental with warm summers, and humid continental with cool summers. There is no evidence that C. incisa occurs in Mediterranean climates. It is potentially suitable because the plants usually are dormant during the summer when conditions are driest in Mediterranean climates [1-7]. The following notes are based on the general needs of the genus. Prefers a moist, well-drained rather light soil, thriving in semi-shade[1]. Grows well in a woodland garden or peat bed. Plants seem to be immune to the predations of rabbits[233]

#### 7.2.458 Solidago spectabilis

Nevada Goldenrod

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Solidago spectabilis is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed[46, 61, 105, 161, 257]. No more details are given.

tcanta DyeMustard, orange and brown dyes can be obtained from the whole plant [168].

dwatta AntisepticThe leaves and flowering stems are antiseptic. An infusion of the dried powdered herb can be

nrakta South-eastern N. America. ksacta Alkaline meadows or bogs to 2200 metres[72].

propta Seed - sow spring in a cold frame. Only just cover the seed and do not allow the compost to become dry. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in pots. Plant them out into their permanent positions in spring or early summer. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer

nwatta Succeeds in any moderately fertile moisture retentive soil in sun or semi-shade[200]. Grows well in heavy clay soils. A rather greedy plant, it is apt to impoverish the soil[1]. There is some confusion over the correct identity of this plant. According to [200] it is a native of Western N. America and grows 50cm tall. According to [72] it is a native of South-eastern N. America and grows 120cm tall. [105] lists this species as a synonym of S. odora. It is quite possible that two species are involved, one of which is a synonym for S. odora. The plant attracts various beneficial insects such as ladybirds, lacewings and hoverflies to the garden, these insects will help to control insect pests in the garden[201, 238].

### 7.2.459 Salvia lanata

6tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia lanata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Stem Edible Uses: Stems are peeled and eaten [2, 177].

dwatta Astringent Dysentery Emetic PoulticeThe roots are used in the treatment of colds and coughs[240]. The seed is emetic[240]. It is used in the treatment of dysentery, haemorrhoids, colic and, externally, boils[240]. A poultice of the leaves is used as a dressing for wounds and is also applied to itchy skin[240].

nrakta E. Asia - Himalayas from Nepal to N.W. Pakistan. ksacta Open slopes in drier areas, 1500 - 3000 metres[51].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[2001]

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 7.2.460 Caulophyllum thalictroides

Papoose Root, Blue cohosh

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 0.5 m hkuc

pcimhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Caulophyllum thalictroides is a PERENNIAL growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in April, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable

### 7.2.454 Goodyera oblongifolia

Western Rattlesnake Plantain

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Goodyera oblongifolia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: GumAn exudation from the plant is used as a chewing gum[105, 161, 177].

dwatta Poultice TonicAn infusion of the plants has been used as a tonic[257]. A poultice of the softened leaves has been applied to cuts and sores[257]. An infusion of the leaves has been used in the bath water for treating stiff muscles[257]

nrakta N. America - Quebec to British Columbia, New Hampshire, Michigan, Arizona and California. ksacta Deep leaf litter and shade of moist or dry coniferous or mixed woods, in East infrequent in cedar swamps, in s Rocky Mountains confined to high elevation spruce-fir forests; 0 - 3400 m[43, 230, 270].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division is best carried out in the spring[230]. Each division should have a leading point and two, or preferably three, joints of the rhizome[230]. More propagating material can be obtained by cutting halfway through the rhizome during the previous growing season at the point where you wish to divide[230]. This will stimulate the production of growth buds at the point of division[230].

nwatta Requires a somewhat shady site and a well-drained compost of peat, leafmold and sand[1]. Does well in the woodland garden[42, 230]. This species is not very hardy in Britain, it is suitable for cultivation in a cool greenhouse or, perhaps, for a select position outdoors[1]. It is closely related to the British native species G. repens[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230].

### 7.2.455 Bergenia ciliata

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Bergenia ciliata is an evergreen Perennial growing to 0.3 m (1ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta The flowers are boiled and then pickled[272]. tcanta TanninThe root contains 14 - 16% tannin[272]. A good ground cover plant[188], forming a slowly spreading clump[208, 233].

dwatta Lithontripic Ophthalmic Poultice Tonic UrinaryA juce or powder of the whole plant is used to treat urinary troubles in Nepal[272]. The juice of the leaves is used as drops to relieve earaches[272]. The root is used as a tonic in the treatment of fevers, diarrhoea and pulmonary affections[218, 240, 243]. The root juice is used to treat coughs and colds, haemorrhoids, asthma and urinary problems[272]. Externally, the root is bruised and applied as a poultice to boils and ophthalmia, it is also considered helpful in relieving backache[243, 272]. The root of this plant has a high reputation in indigenous systems of medicine for dissolving stones in the kidneys[240].

nrakta E. Asia - Himalayas from Afghanistan to E. Tibet. ksacta On moist rocks and under forest shade, 1900 - 2600 metres in Kashmir[145].

propta Seed - surface sow in a greenhouse. Make sure that the compost does not dry out. Two weeks cold stratification can speed up germination which usually takes 1 - 6 months at 15°c[134]. Fresh seed, sown as soon as it is ripe in late spring is liable to germinate better than stored seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in late spring after flowering[188] or in autumn[200]. Very easy, larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Succeeds in full sun or light shade in most soils[200] but prefers a deep fertile soil that does not dry out fully[134]. Grows well in heavy clay soils. Plants are at their best in a medium-heavy soil[208]. Succeeds in shade or semi-shade-[187]. The leaf colour is best when plants are grown in a poor soil in a sunny position[188]. Dislikes cold winds[197]. The plant is hardy to about -20°c, but the flowers and young leaves are rather sensitive to frost[187] so it is best to choose a position with shade from the early morning sun. This species is only hardy in sheltered gardens of south and west Britain[208]. If the leaves are cut back by frost then they are soon replaced by fresh leaves in the spring[188]. The roots of this plant are commonly collected from the wild for medicinal purposes. Overcollection in many areas of its range are a cause for conservation concern[272]. Plants seem to be immune to the predations of rabbits [233]. The different species of this genus will hybridise freely when grown near each other[233].

#### 7.2.456 Geranium thunbergii

Thunberg's geranium

1230

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Geranium thunbergii is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaYoung leaves[183]. No further details are given. Old leaves, when the plant is at the peak of its growth, are used as a tea substitute[183].

dwatta AstringentThe whole plant is astringent[105].

nrakta E. Asia - China, Japan, Korea. ksacta Grassy places in lowland areas all over Japan[58].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils that are not water-logged[200]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. This species is closely related to I. glabra[43]. Flowers are produced on the current year's growth[229]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.397 Lindera umbellata

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Lindera umbellata is a deciduous Shrub growing to 3 m (9ft 10im). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: Condiment OilThe decoction is poured over rice or millet and eaten[105, 177]. We have no more details

tcanta OilAn oil obtained from the seed is used for lighting[61].

nrakta E. Asia - China, Japan. ksacta Scrub at up to 3000 metres in W. China[184].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse. The seed has a short viability and should not be allowed to dry out[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in early sumer. Cuttings of half-ripe wood, July in a frame[200]. Layer-

ing. nwatta Requires a lime-free rather moist soil[200]. Prefers partial shade or dappled sunlight in a fertile moisture-retentive soil enriched with leafmould[200]. Succeeds in full sun or semi-shade[182, 184]. Hardy to about -15°c[184]. Plants can be pruned right back to the base if required, though any drastic pruning is best spread over several seasons[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious, male and female plants

### 7.2.398 Illicium floridanum

must be grown if seed is required.

Aniseed Tree, Florida anisetree, Purple Anise, Star Anise, Florida anise

6 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Illicium floridanum is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no mention of toxicity has been seen for this species, at least one other member of the genus has a fruit that is poisonous in quantity[19, 177].

kcakta Edible Parts: Edible Uses: CondimentSaid to be used as a spice[105, 177, 183]. No further details are given, but the leaves have a strong aroma of aniseed[245].

nrakta South-eastern Ň. America - Florida to Louisiana. ksacta Lowland wet areas, often in sandy soils along streams, swamps and at the head of bays[229], in light woodland and thickets[2001.

propta Seed - it does not require pre-treatment and can be sown in early spring in a greenhouse[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold over the winter for the first year or two. Layering in early spring. Takes 18 months[78]. Cuttings of half-ripe wood, August in a frame[113]. Pot up the cuttings when they start to root and grow them on in the greenhouse for their first winter, planting out after the last expected frosts. Suckers are sometimes produced at some distance from the parent plant. These suckers can be potted up in early spring, then grown on for a year before planting them out into their permanent positions.

nwatta Landscape Uses:Border, Foundation, Pest tolerant, Massing, Screen, Specimen, Woodland garden. Prefers a light, moist well-drained loam and a sheltered position[1, 111 Prefers a humus-rich lime-free soil[182, 200]. A plant of woodland shade in its native habitat, in the less sunny British climate it succeeds in sun or semi-shade[200, 260]. This species is not very cold-hardy, it tolerates temperatures down to between -5 and -10°c, only succeeding outdoors in the mildest areas of Britain[1, 11, 166]. A slow-growing tree[229], the whole plant is very aromatic[182]. The bruised leaves have a strong scent of aniseed, whilst the flowers have a powerful spicy odour[245]. Suckers can spring up at some distance from the parent plant[260]. Special Features:Attracts birds, Attractive foliage, North American native, Fragrant foliage, Wetlands plant, Suitable for cut flowers. Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping plant, forming a colony from shoots away from the crown but with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

### 7.2.399 Gunnera tinctoria

Gunnera, Chilean gunnera

1211

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gunnera tinctoria is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young leaf stalks - peeled and cooked as a vegetable or eaten raw[2, 177, 183]. Acid and refreshing[139].

tcanta Dye Roofing TanninA black dye is obtained from the root[139]. The root contains 9% tannin[46, 139]. Leaves are used as a roof covering[139].

dwatta AstringentThe whole plant is astringent[139]. nrakta S. America - Chile. ksacta Moist soils by lakes and rivers of the Central Provinces[139].

propta Seed - best sown as soon as it is ripe in the autumn in a sandy mix in a cold frame. The seed can also

be sown in a shady position in a greenhouse in the spring. Germination usually takes place within 2 - 8 weeks at 15°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division as new growth commences in the spring. The clumps can be planted out direct into their nermanent positions

nwatta Requires a damp humus rich soil in a sunny position or semi-shade, sheltered from strong winds. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. The rootstock is rather tender, surviving to -10°c and requiring some protection away from the milder parts of Britain. This can be achieved by piling either bracken or the plants dying leaves around the crown[187]. The top part of the inflorescence is male, the bottom is female and the middle is hermaphrodite. A very ornamental plant with huge leaves, it forms a slowly spreading dense clump[187]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 7.2.400 Rheum officinale

Chinese Rhubarb

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli ilutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rheum officinale is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

pcista Although no specific mention has been seen for this species, the leaves of some if not all members of this genus contain significant quantities of oxalic acid and should not be eaten in any quantity. Oxalic acid can lock up certain minerals in the body, especially calcium, leading to nutritional deficiency. The content of oxalic acid will be reduced if the plant is cooked. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: StemEdible Uses: RutinLeaf stem - cooked or raw[177, 178]. Rather medicinal[105]. One report says that the plant contains 1.3% rutin[240]. It does not specify which part of the plant, though it is likely to be the leaves[K]

tcanta Plants can be grown for ground cover when spaced about 1.8 metres apart each way[208].

dwatta Anticholesterolemic Antiseptic Antispasmodic Antitumor Aperient Astringent Cholagoque Diuretic Stomachic Tonic Rhubarb has a long and proven history of herbal usage, its main effect being a positive and balancing effect upon the whole digestive system. It is one of the most widely used herbs in Chinese medicine[218, 238]. The root is anticholesterolemic, antiseptic, antispasmodic, antitumor, aperient, astringent, cholagogue, demulcent, diuretic, laxative, purgative, stomachic and tonic[4, 147, 171, 176, 218, 238]. The roots contain anthraquinones, which have a purgative effect, and also tannins and bitters, which have an opposite astringent effect[244]. When taken in small doses, it acts as an astringent tonic to the digestive system, whilst larger doses act as a mild laxative[232, 244]. The root is taken internally in the treatment of chronic constipation, diarrhoea, liver and gall bladder complaints, haemorrhoids, menstrual problems and skin eruptions due to an accumulation of toxins[238]. This remedy is not prescribed for pregnant or lactating women, nor for patients with intestinal obstruction[238]. Externally, the root is used in the treatment of burns[238]. The roots are harvested in October from plants that are at least six years old, they are then dried for later use[4]. A homeopathic remedy is prepared from the dried root[232]. This is used especially in the treatment of diarrhoea in teething children[232].

nrakta E. Asia - Tibet. ksacta Hills and forest understories at elevations of 1200 - 4000 metres in western China[266]

propta Seed - best sown in autumn in a shaded cold frame[200]. The seed can also be sown in spring in a cold frame. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in the spring. Division in early spring or autumn[1, 111]. Divide up the rootstock with a sharp spade or knife, making sure that there is at least one growth bud on each division. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a deep, fertile, moderately heavy, humus rich, moisture retentive, well-drained soil in sun or semishade[200]. Grows well in heavy clay soils. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Hardy to about -20°c[200]. A very ornamental plant[1], it is closely related to R. australe[200]. Hybridizes freely with other members of this genus[200]. Cultivated as a medicinal plant in China[61]. Plants at the Cambridge Botanical Gardens in September 1993 were growing well in the shade of a woodland garden, though they were not succeeding when planted closely to the trees[K]. Plants in this genus seem to be immune to the predations of rabbits[233].

#### 7.2.401 Nandina domestica

Sacred Bamboo, Heavenly Bamboo 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 2.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Nandina domestica is an evergreen Shrub growing to 2.5 m (8ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The fruit is poisonous[147].All parts of the plant contain toxic substances, including hydrocyanic acid and nandenine[218].

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit[2]. No further details are given, but another report says that the fruit is poisonous[147]. The fruit is about 10mm in diameter[200]. Young leaves - boiled[177]. The water must be changed at least once during the cooking[105].

tcanta Hedge HedgePlants are used for hedging in warm temperate zones[200].

dwatta Antirheumatic Antitussive Astringent Febrifuge Stomachic TonicThe roots and stems are antitussive, astringent, febrifuge, stomachic and tonic[147, 174]. A decoction is used in the treatment of fever in influenza, acute bronchitis, whooping cough, indigestion, acute gastro-enteritis, tooth abscess, pain in the bones and muscles and traumatic injuries[147]. It is especially useful in the treatment of children's coughs[174]. There is a danger that an overdose can cause respiratory paralysis[174]. A decoction of the leaves is tonic[218]. The fruit is febrifuge and tonic[218]. Another report says that it is toxic, so great care should be employed if using it[147]. The root is antirheumatic[218]. Young shoots contain high concentrations of laetrile - up to 20% on a zero moisture basis[218].

nrakta E. Asia - China, Japan and India, ksacta Ravines and valleys in mountains and warmer parts of C. and S. Tapan[58].

propta Seed - best sown as soon as it is ripe in a greenhouse[113]. Stored seed should be sown as early in the year as possible in a greenhouse. Germination is often poor[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 - 15cm long, July/August in a frame[78]. Pot up in the autumn and

will make harvesting any quantity of seed very fiddly and time 7.2.452 Sedum spurium

nrakta Europe, Western N. America, Naturalized on the Farne Islands, N.E. Britain[200]. ksacta Dry open slopes and flats, often in disturbed soil[60]

propta Seed - sow late spring in situ[200].

nwatta Succeeds in ordinary garden soil in full sun[1,

### 7.2.451 Rhododendron anthopogon

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Rhododendron anthopogon is an evergreen Shrub growing to 0.6 m (2ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention of toxicity has been seen for this species, it belongs to a genus where many members have poisonous leaves. The pollen of many if not all species of rhododendrons is also probably toxic, being said to cause intoxication when eaten in large quantities[183].

kcakta Edible Parts: Edible Uses: TeaThe flowers are used as a tea substitute[272].

tcanta IncenseThe dried leaves are used as incense[272].

dwatta Antitussive Diaphoretic Digestive Febrifuge TonicThe stems and leaves of the sub-species R. anthopogon hypenanthum are used in Tibetan herbalism[241]. They have a sweet, bitter and astringent taste and they promote heat[241]. They are antitussive, diaphoretic and digestive and are used to treat lack of appetite, coughing and various skin disorders[241]. In Nepal, the leaves are boiled and the vapour inhaled to treat coughs and colds[272]. The flowers of the sub-species R. anthopogon hypenanthum are also used in Tibetan medicine, having a sweet taste and neutral potency[241]. They are antitussive, febrifuge and tonic, being used in the treatment of inflammations, lung disorders and general weakening of the body[241]. They are also used when water and locality are not agreeable due to a change of environment[241].

nrakta E. Asia - W. China to the Himalayas. ksacta Moist open slopes, hillsides, ledges of cliffs and in thickets at elevations of 3000 - 4500, occasionally to 5000 metres[266].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires[200]. A pH between 4.5 and 5.5 is ideal[1]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants. herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when guite large, so long as the root ball is kept intact[2001. The whole plant is strongly aromatic with a slightly acrid odour, especially when crushed[11]. Plants in this genus are notably susceptible to honey fungus[200].

Caucasian Stonecrop

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum spurium is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. The leaves are thick and juicy but somewhat astringent and with a slight bitterness[K].

tcanta Can be used as a ground cover plant in a sunny position[197, 208]. It requires weeding for the first year or so[197].

nrakta E. Europe - Caucasus. A garden escape in Britain[50], ksacta Rocks in moist regions in the middle and upper alpine zones[83].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made. it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Tolerates poor soils. Hardy to about -5°c[200]. A mat-forming plant, it is very invasive[83]. The flowers of this species are white or pink[200]. All members of this genus are said to have edible leaves, though those species that have vellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

### 7.2.453 Arthromeris wallichiana

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc pcimhmim cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Arthromeris wallichiana is a FERN growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist

kcakta Edible Parts: LeavesEdible Uses: Tender young fronds - cooked. Used as a vegetable[272].

dwatta AntisepticThe root is antiseptic. A paste of the roots is applied as a poultice to wounds and boils[272].

nrakta E. Asia - Nepal to China. ksacta Shady places on mossy tree trunks, thick branches and rocks, at elevations of 1300 - 2800 metres in Nepal[272].

propta Spores - best sown as soon as ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Pot on small clumps of plantlets as soon as they are large enough to handle and keep humid until they are well established. Do not plant outside until the ferns are at least 2 years old and then only in a very well sheltered position. Division in spring[200].

nwatta Tolerates short periods of drought and direct sunlight, but it prefers bright filtered light[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

Closely related to P. capitata, but this species is more tolerant of winter cold and wet conditions[200].

# 7.2.448 Meconopsis aculeata

 $6\ tlin\ 9\ cyuc\ 1\ kcak\ 0\ tcan\ 2\ dwat\ 0.6\ m\ hkuc$ hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Meconopsis aculeata is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

pcista The whole plant, but especially the root, is considered to be poisonous, it contains narcotic principles[211, 240].

kcakta Edible Parts: LeavesEdible Uses: The plant is said to be edible[145] but no further details are known, not even which part of the plant can be eaten.

dwatta Analgesic Febrifuge NarcoticThe root contains narcotic principles[211, 240]. The entire plant is used in Tibetan medicine, where it is considered to have a bitter taste and a cooling potency[241]. Analgesic and febrifuge, it is used to help heal broken bones, to treat inflammation from fractures and pain in the upper bodily region, especially around the ribs[241].

nrakta E. Asia - W. Himalayas from Pakistan to Uttar Pradesh. ksacta Rocky slopes and damp rocks, 3000 - 4000 metres[51]

propta Seed - best sown in a cold frame as soon as it is ripe in late summer. Spring sown seed is slower to germinate[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Grows best in a woodland soil in partial shade[1, 200]. The soil should be lime-free, moist, well-drained and moderately rich[200]. Dislikes full sun and windy positions[200]. Monocarpic, the plants living for a number of years before flowering but then dying once they flower[200].

# 7.2.449 Paeonia potaninii

Tree Peony

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Paeonia potaninii is a deciduous Shrub growing to 0.6 m (2ft) by 1.5 m (5ft in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: The following use is for P. suffruticosa. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Cholera DysenteryThe bark obtained from the root has an antimicrobial effect upon various bacteria, including Escherichia coli, typhoid, cholera, Staphylococcus aureus, streptococcus hemolyticus and Pneumococci[250]. The root is also anti-inflammatory and has been used with success in the treatment of arthritic joint swelling[250]. The root is also analgesic, sedative and anticonvulsant, it has a high success rate in the treatment of dysentery and can also be used to treat allergic rhinitis[250]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218]. A tea made from the dried crushed petals of various peony

species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - W. China to Tibet. ksacta Woodland edges and mountain slopes.

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division of suckers in the dormant season. They are probably best potted up and grown on in light shade in a greenhouse until they are established.

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°c[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. Closely related to P. delavayi, differing mainly in the size of the flowers, its more dissected leaves and its suckering habit[11]. This species is not recognised by Chinese botanists, who hold that it is no more than a form of P. delavayi[214]. A very ornamental plant[1]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, they are therefore best sited in a position that is shaded from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214].

#### 7.2.450 Amsinckia lycopsoides

Tarweed Fiddleneck

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Amsinckia lycopsoides is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Fresh juicy shoots[161, 177, 257]. No more details are given. Seed - raw[257]. The parched seed is ground into a powder then made into cakes and eaten without being cooked[257]. If this species is like most other members of the family Boraginaceae, the seed is likely to ripen over a period of time and individual seeds fall from the plant when they are ripe. This

overwinter in a cold frame. Plant out in late spring. High percentage[78] but very slow[11]. Cuttings of mature wood, 10 - 15cm with a heel, November in a frame[78]. Plant out the following autumn[78, 200]. High percentage[78] but very slow[11].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Rock garden, Screen, Specimen. Requires a deep rich moist soil in a sheltered sunny position[11, 200]. Prefers a cool but sunny position[200]. A very ornamental plant, it only successful outdoors in Britain in favoured localities[1]. Grows well in Cornwall[59]. Tender when young[11], the shoot tips of mature plants can be damaged by hard frosts[200]. A number of named forms have been developed for their ornamental value[182]. Untidy old stems on established plants can be pruned to the base in spring[188]. Cultivated for its fruit in China and Japan[2] ( does this refer to medicinal usage?). It does not fruit freely in Britain[11]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, Attractive foliage, Not North American native, Invasive, Naturalizing, Attractive flowers or blooms.

# 7.2.402 Eupatorium japonicum

Poi I ar

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eupatorium japonicum is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Young leaves - cooked. Boiled and well seasoned[177]. Root - cooked. It is sometimes eaten for food and is considered beneficial to the circulation[218].

dwatta Anodyne Antibacterial Antidandruff Antiviral Carminative Diaphoretic Diuretic Nervine Vermifuge Women's complaintsThe leaves and stems are anodyne, antibacterial, antiviral, carminative, diaphoretic, diuretic, nervine and vermifuge[176, 218]. They are taken internally in the treatment of indigestion, nausea, vomiting, diarrhoea, feverish colds etc[147, 176, 238]. In excess the plant causes irritation to the stomach[238]. The leaves and stems are harvested in the summer before the flower buds open, and are dried for later use[238]. The plant contains the essential oil thymol. In large doses this can cause various health problems such as headaches, tinnitus, vertigo, inhibition of respiration and the circulation[176]. Use with caution[176]. The seed is prescribed in China for the '36 diseases of women'[218]. The root is considered to be beneficial to the circulation and a restorative to women after parturition[218]. It is harvested in the autumn and dried for later use[238]. The herbage, soaked in oil, is applied to the hair as a treatment for dandruff[218].

nrakta E. Asia - S. China, Japan. ksacta Moist grassland along river banks[275].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Succeeds in ordinary well-drained but moisture retentive garden soil in sun or part shade[200]. A very polymorphic species[58], it is closely related to E. cannabinum[1]. This species is a member of natural moist grassland flora on river banks in the Kanto District of Japan. Due to urbanization of this area, the habitat is now restricted to a very small area, and the species is endangered[275]. Plants seem to be immune to the predations of rabbits[233].

### 7.2.403 Artemisia indica

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 1.2 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli

drutta Artemisia indica is a ANNUAL/PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is polinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista Although no reports of toxicity have been seen for this species, skin contact with some members of this genus can cause dermatitis or other allergic reactions in some people[222].

kcakta Edible Parts: LeavesEdible Uses: Colouring CondimentYoung leaves - cooked and eaten with barley[183]. The leaves are also pounded with steamed glutinous rice to give a flavour and colouring[177, 183].

tcanta Essential Incense InsecticideThe plant yields about 0.2% essential oil. This is a good larvicide and a feeble insecticide[240]. The dried leaves and flowers are used as an incense[2721.

dwatta Anthelmintic Antiseptic Antispasmodic Dysentery Emmenagogue Expectorant Ophthalmic Stomachic TonicThe leaves and flowering stems are anthelmintic, antiseptic, antispasmodic, emmenagogue, expectorant and stomachic[240, 272]. An infusion is used in the treatment of nervous and spasmodic affections, in asthma and in diseases of the brain[240, 272]. This infusion is also considered to be helpful in improving the appetite[272]. The juice of the plant is used in Nepal to treat diarrhoea, dysentery and abdominal pains[272]. It is used as an eyewash where it is said to relieve the burning sensation in conjunctivitis[272]. A paste of the plant is applied externally to treat wounds[272]. The roots are antiseptic and are a tonic for the kidneys[240, 266, 272].

nrakta E. Asia - China, Japan, India. ksacta Waste ground in central and southern Japan[58]. The sides of paths and tracks, margins of cleared forests at elevations of 300 - 2500 metres in Nepal[272].

propta Seed - surface sow spring in a greenhouse. Do not allow the compost to dry out. When large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. The seed can also be sown in situ in late spring.

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Plants are annuals or short-lived perennials[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 7.2.404 Scrophularia umbrosa

Water Betony, Water figwort 6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Scrophularia umbrosa is a PERENNIAL growing to 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollimated by Bees, wasps. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

pcista The plant is probably poisonous to cows[76]. kcakta Edible Parts: RootEdible Uses: Root - cooked[2, 105]. There must be some doubts about the edibility of this root[K].

dwatta Detergent Eczema VulneraryThe leaves are detergent and vulnerary[4]. They are harvested as the plant comes into flower and can be used fresh or dried for later use[4]. The plant has a good reputation as a wound herb, either applied externally as a poultice or taken as a decoction[4]. Water betony is said to have similar medicinal properties to the knotted figwort, S. nodosa[254]. These properties are as follows: Knotted figwort is a plant that supports

detoxification of the body and it may be used as a treatment for various kinds of skin disorders[254]. The whole plant is alterative, anodyne, anti-inflammatory, diuretic, mildly purgative and stimulant[4, 9, 21, 165]. It is harvested as the plant comes into flower in the summer and can be dried for later use[4]. A decoction is applied externally to sprains, swellings, burns, inflammations etc, and is said to be useful in treating chronic skin diseases, scrofulous sores and gangrene[4, 254]. The leaves can also be applied fresh or be made into an ointment[4]. Internally, the plant is used in the treatment of chronic skin diseases (such as eczema, psoriasis and pruritis), mastitis, swollen lymph nodes and poor circulation[238]. It should not be prescribed for patients with heart conditions[238]. The root is anthelmintic[9].

nrakta Europe, including Britain, south and east from S. Sweden to France, Palestine and Asia to Tibet. ksacta Damp shady ground, usually near water[4, 17]. An occasional garden weed[1].

propta Seed - sow spring or autumn in a cold frame[238]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed then it can be sown outdoors in situ in the autumn or the spring. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most moist soils. A good bee plant[4].

### 7.2.405 Cistus albidus

Rock Rose

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Cistus albidus is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is polinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

koakta Edible Parts: Edible Uses: Condiment TeaThe leaves are used as a tea substitute[177, 183]. The dried leaves are sometimes used as an adulterant for marjoram (Origanum majorana)[183].

nrakta S.W. Europe to N. Africa - Mediterranean. ksacta Garigue, rocky places on limestone soils and open pine forest[89].

propta Seed - gather when ripe and store dry[78]. Surface sow in late winter in a greenhouse[164]. The seed usually germinates in 1 - 4 weeks at  $20^{\circ}$ c[164]. Prick out the seedlings as soon as they are large enough to handle into individual pots. Grow them on in the greenhouse for their first winter and plant them out the in the following spring or early summer, after the last expected frosts[164]. The seed stores for at least 3 years[K]. Cuttings of softish to half-ripe wood, 8cm long with a heel or at a node, June/August in a frame. Roots are formed within 3 weeks[78]. High percentage[78]. Cuttings of almost mature wood, 8 - 12cm with a heel or at a node, September/October in a frame. High percentage[78]. Lift and pot up in the spring, plant out when a good root system has formed[78]. Layering in spring.

nwatta Requires a sunny position in a well-drained light sandy soil[1, 182]. Prefers a calcareous soil[190]. Withstands drought once it is established[190]. Tolerates maritime exposure[188]. One of the hardiest species in this genus, tolerating temperatures down to about -15°c[184] and surviving all but the coldest winters in Britain[11], it is however apt to be short-lived[182]. Plants are somewhat hardier when grown in poor soils[182]. Individual flowers only last one day but there is a long succession of them[200]. Dislikes pruning or root disturbance[182, 200]. Plants should be pot grown and then planted out in their final positions

whilst still small. Plants in this genus are notably resistant to honey fungus[200]. Hybridizes freely with other members of this genus[200].

# 7.2.406 Onopordum illyricum

Cotton Thistle, Illyrian cottonthistle

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Onopordum illyricum is a BIENNIAL growing to 1.3 m (4ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flower buds-cooked. Used as a globe artichoke (Cynara scolymus) substitute[183], though they are even more fiddly than that plant[K].

nrakta S. Europe. ksacta Sunny and well-drained habi-

propta Seed - sow spring in situ[200]. The seed can also be sown in situ in autumn[200]. If the seed is in short supply then it can be sown in a pot in the greenhouse in the spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta Succeeds in almost any ordinary garden soil. Requires a well-drained soil in full sun. Prefers a slightly alkaline soil. Plants are hardy to about -15°c. Often self-sows, sometimes to the point of nuisance, though the seedlings can easily be hoed out and can also be transplanted if they are moved whilst still small[200]. The flowers are very attractive to bees

# 7.2.407 Viscum album

Mistletoe, European mistletoe 6 tlin 9 cyuc 1 keak 0 tcan 3 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Viscum album is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from February to April, and the seeds ripen from November to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista All parts of the plant are poisonous[10, 19], though the toxicity level is very slight[65]. Hepatitis may occur. Toxic doses: hypotension, coma, seizures, pupil dilation, death. Contraindicated during pregnancy. Can interfere with allopathic drugs for high blood pressure, heart disease, antidepressants and anticoagulants. Avoid for progressive disorders like tuberculosis. It's use for cancers and leukemia is currently under review [301].

kcakta Edible Parts: FruitEdible Uses: The ripe fruit is edible[272]. Some caution is advised, see notes above on toxicity[K].

dwatta Antianxiety Anticonvulsant Antidiarrhoeal Antispasmodic Cardiac Cytostatic Diuretic Epilepsy Hypotensive Narcotic Nervine Stimulant Tonic VasodilatorMistletoe is chiefly used to lower blood pressure and heart rate, ease anxiety and promote sleep. In low doses it can also relieve panic attacks and headaches, and also improves the ability to concentrate[254]. The plant's efficacy as an anticancer treatment has been subject to a significant amount of research - there is no doubt that certain constituents of the

pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta The European Union has granted the refined oil of the seed of Buglossoides arvensis novel food status (a type of food that does not have a significant history of consumption or is produced by a method that has not previously been used for food) and some farmers are growing it.

dwatta DiureticAn infusion of the leaves is used as a diuretic[240].

nrakta Central and southern Europe, including Britain, through Asia to the Himalayas. ksacta Arable fields, rough ground and open grassy places[17].

propta Seed - sow spring in situ. Germination should take place within a few weeks.

nwatta 207189 Prefers a moderately fertile well-drained soil[200].

## 7.2.445 Geranium dissectum

Cut-Leafed Cranesbill, Cutleaf geranium 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Geranium dissectum is a ANNUAL growing to 0.6 m (2th). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. A famine food, used when all else fails[177].

tcanta Dye TanninA brown dye is obtained from the dry flowers[168]. The leaves and roots are rich in tannin[4].

dwatta Antiseptic Astringent Cholera Dysentery Styptic TonicThe whole plant, but especially the roots, is rich in tanini[4]. It is antiseptic, highly astringent, styptic and tonic[4]. An infusion of the whole plant, or of the roots alone, is used in the treatment of diarrhoea (especially for children and the elderly), dysentery, cholera, gastro-enteritis, internal bleeding, excessive menstruation etc[4]. Externally, it is used in the treatment of purulent wounds, haemorrhoids, thrush, vaginal discharges, inflammations of the mouth etc[238]. It is best to harvest the roots as the plant comes into flower since they are then at their most active medicinally[4]. The leaves should be harvested before the plant sets seed[4]. Both are dried for later use[238].

nrakta Most of Europe, including Britain, south to N. Africa and east to Iran. ksacta Cultivated and waste ground, grassland, hedgebanks etc to 375m[17].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

#### 7.2.446 Anemone rivularis

Can Vu Mai

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Anemone rivularis is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention has been seen for this species, many members of this genus contain protoanemonin, an irritating acrid oil that is an enzymatic

breakdown product of the glycoside ranunculin. While protoanemonin can cause severe topical and gastrointestinal irritation, it is unstable and changes into harmless anemonin when plants are dried or heated[4, 10, 19, 65, 270].

kcakta Edible Parts: SeedEdible Uses: Seeds - roasted and pickled[272].

dwatta Analgesic Antidote Antiemetic VermifugeThe plant is said to be antiemetic and vermifuge[91]. It is said to warm the stomach and stop vomiting. A paste made from the plant is used in Nepal to treat coughs and fevers[272]. The juice of the leaf, mixed with water, is inhaled through each nostril to treat sinusitis[272]. The seeds are used in Tibetan medicine, they are said to have a bitter and acrid taste with a heating potency[241]. Analgesic and antidote, they are used in the treatment of rotting tissues, snake poisoning and stomach/intestinal pain from worm infestation[241]. A decoction of the root is applied externally to cuts and wounds[272].

nrakta E. Asia - Tibet, Himalayas, Sri Lanka. ksacta Meadows, forest clearings, bunds between paddy fields, streamsides and hedges[187]. Under alpine brush in the Himalayas. 4000 - 5000 metres[91].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring, it requires 3 - 5 weeks cold stratification. The seed usually germinates in 1 - 6 months at 20°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first year in a lightly shaded place in a greenhouse. When large enough, plant them out into their permanent positions in the spring. Division in late summer after the plant dies down.

nwatta Easily grown in a moist well-drained soil in sun or semi-shade[187]. Succeeds in ordinary garden soil but prefers a rich sandy loam[1]. Requires a damp soil, doing well by water[1, 111]. A very ornamental plant[1], it is hardy to about -20°c[187]. This species is closely related to A. narcissiflora[233]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially lequimes[54].

# 7.2.447 Paronychia argentea

Algerian Tea

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.1 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Paronychia argentea is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: TeaAn infusion of the flowers is used as a tea[183].

tcanta Especially useful as a ground cover plant after bulbs have flowered[200, 208]. The plants form a low carpet, rooting as they spread, and they should be spaced about 30cm apart each way[208].

dwatta Aphrodisiac Diuretic TBAn infusion of the leaves is aphrodisiac and diuretic[200]. It is also used in the treatment of TB[200]

nrakta S. Europe to S.W. Asia. ksacta Dry rocky habitats[200]

propta Seed - we have no information for this species but suggest sowing the seed in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[2001.

nwatta Requires a warm open position in full sun, in a sharply drained sandy or gritty soil. If the soil is too rich the plants leaves will not be so silvery[200]. Plants can be grown in a wall[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between – and -10°c, perhaps more if in a perfectly drained soil[200].

very alkaline soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought.

pcista The berries are purgative[8]. Caution required if used in patients on treatment for high blood pressure. An increase in tone of veins can influence blood pressure allowing more blood to flow to the heart [301].

kcakta Edible Parts: StemEdible Uses: CoffeeYoung shoots - cooked[1, 2, 4, 5, 8, 11]. They are harvested in the spring as they grow through the soil and used as an asparagus substitute[7, 183]. The taste is pungent and rather bitter[132, 183]. The roasted seed is a coffee substitute[1, 105, 183].

tcanta Broom ScourerMature shoots are bound into bunches and used as scourers or as besoms[4, 6, 8, 11, 100, 182]

dwatta Antipruritic Aperient Deobstruent Depurative Diaphoretic Diuretic VasoconstrictorButcher's broom is little used in modern herbalism but, in view of its positive effect upon varicose veins and haemorrhoids, it could be due for a revival[254]. The root is aperient, deobstruent, depurative, diaphoretic, diuretic and vasoconstrictor[4, 7, 238]. It has been taken internally in the past in the treatment of jaundice, gout, and kidney and bladder stones, at the present time it is used to treat venous insufficiency and haemorrhoids[238]. It should not be prescribed for patients with hypertension[238]. It is also applied externally in the treatment of haemorrhoids[238]. The root is harvested in the autumn and dried for later use[4]. The whole plant is also sometimes used[4]. This remedy should not be given to people with high blood pressure[254]. The plant contains saponin glycosides, including ruscogenin and neoruscogenin. These substances are anti-inflammatory and cause the contraction of blood vessels, especially veins 2541. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Ruscus aculeatus for haemorrhoids (piles) and venous conditions (see [302] for critics of commission E) [301].

nrakta Western and southern Europe from Britain to Switzerland, south to the Mediterranean. ksacta Outskirts of dry woods and in moist uncultivated ground especially on chalk/7. 17. 1861.

propta Seed - sow the seed thinly in early spring in a cold frame in light shade. The seed germinates better if it is given a period of cold stratification. Germination can be rather slow, sometimes taking 12 months or more. Grow the seedlings on in the pot in light shade in the greenhouse for their first growing season, giving occasional liquid feeds to ensure they do not suffer nutrient deficiencies. Prick them out into individual pots in the following spring and grow them on for at least another year in the pots before planting them out in early summer. Be very sure to protect the seedlings from slugs[K]. Division as the plant comes into growth in early spring[186]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Tolerant of most soils[11], including chalky and heavy clay soils[200]. Prefers a shady position[1, 31], tolerating dense dry shade and bad growing conditions[186], including the drip-line of trees[182]. Dislikes much wetness at the roots[186]. Established plants are drought resistant[186]. A very hardy plant, when fully dormant it can tolerate temperatures down to about -25°c[187]. Plants have a slowly creeping tough rootstock and eventually form large clumps[187]. Plants in this genus are notably resistant to honey fungus[200]. Plants are unusual in that the flowers are produced from the middle of the leaf[4]. Although normally dioecious, some hermaphrodite forms are known[200]. One of these is called 'Sparkler'. Male and female plants must usually be grown if seed is required.

# 7.2.442 Orychophragmus violaceus

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Orychophragmus violaceus is a AN-NUAL/BIENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[200].

nrakta E. Asia - eastern China to Korea. ksacta Roadsides, gardens, forests, fields, thickets, valleys, hillsides and sunny slopes from near sea level to 1500 metres[266].

propta Seed - sow in situ in spring or early summer. nwatta Suceeds in a fertile well-drained soil in a sunny position[200]. Plants are not very cold-tolerant[188], but they can be overwintered outdoors in areas where winter temperatures do not fall below about -5°c[200]. This species is cultivated as a vegetable in China[200].

## 7.2.443 Coprosma atropurpurea

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma atropurpurea is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw[173]. Sweet, but with little flavour[225, K]. The wine-red fruit is about 8 - 12mm in diameter[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Lowland to higher montane regions in tussock grass, stream margins, rocky places and dry river beds on North and South Islands[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame. Division of suckers[225].

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils, so long as they are well-drained[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Another report says that it is quite hardy in Britain[225]. Closely related to C. pumila, and often confused with that species[225]. It hybridizes freely with other members of this genus[200, 225]. This species is often confused with C. petriel[11, 44], though it is quite distinct and does not hybridise with that species[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

# 7.2.444 Buglossoides arvensis

Field Gromwell, Corn gromwell 6 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Buglossoides arvensis is a ANNUAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is

plant, especially the viscotoxins, exhibit an anticancer activity but the value of the whole plant in cancer treatment is not fully accepted[254]. It is said that the constituents of mistletoe vary according to the host plant it is growing on - that found on oak trees is said to be superior[238]. Because of the potential side effects, this plant should only be used internally under the guidance of a skilled practitioner. Using the plant internally can provoke intolerant reactions to certain substances[7]. The leaves and young twigs contain several medically active compounds[279]. They are antispasmodic, cardiac, cytostatic, diuretic, hypotensive, narcotic, nervine, stimulant, tonic and vasodilator[4, 7, 19, 21, 46, 66, 165, 238, 279]. They are harvested just before the berries form and are dried for later use[4]. Mistletoe has a reputation for curing epilepsy and other convulsive nervous disorders[4]. The effect of the correct dosage is to lessen and temporarily benumb the nervous activity that causes the spasms, but larger doses can produce the problem[4]. Mistletoe has also been employed in checking internal haemorrhages, in treating high blood pressure and in treating cancer of the stomach, lungs and ovaries[4, 9, 238, 279]. Externally, the plant has been used to treat arthritis, rheumatism, chilblains, leg ulcers and varicose veins[238]. A homeopathic remedy is made from equal quantities of the berries and leaves[4]. It is difficult to make because of the viscidity of the sap[4]. The German Commission E Monographs, a therapeutic quide to herbal medicine, approve Viscum album Mistletoe for rheumatism, tremor therapy as a adjuvant (see [302] for critics of commission E).

nrakta Europe, including Britain, from Scandanavia south and east to N. Africa, central Asia and Japan. ksacta Grows on the branches of many trees, especially poplars, apples, chestnut and birch and especially on calcareous soils[7, 17]. Not usually found on conifers[17].

propta This is a parasitic plant that grows entirely on the host tree. To grow it you need to obtain berries and squash them onto the branches of host trees in late autumn and early winter[11]. This is best done on the lower side of the branch[1]. It is then simply a matter of waiting and hoping

nwatta A parasitic plant, growing on the branches of several deciduous species of trees. It is not usually found on coniferous trees, though the subspecies V. album abietis is found on conifers, especially Abies spp, whilst V. album austriacum is found on pine and larix. The host tree must be at least 20 years old[200]. Although the host branch might eventually succumb, the host tree is seldom killed[200].

# 7.2.408 Hydrangea hirta

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli xre7t hjonli

drutta Hydrangea hirta is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked[105]. Eaten with rice[177].

nrakta E. Asia - C. Japan. ksacta Not known

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[2001.

nwatta Tolerates most soils[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is

grown in a low rainfall area then it requires shade at the hottest part of the day[11]. It grows well on very acid soils with a pH around 4.5[200]. Although the dormant plant is quite hardy in Britain, the young growth in spring can be damaged by late frosts. Closely related to H. scandens[200]. This species is notably susceptible to honey fungus[200].

# 7.2.409 Geranium nepalense

Nepalese Crane's Bill

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 1 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Geranium nepalense is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Leaves[179]. No further details are given. Fruits - chewed fresh[272]. The fruit is a small dry capsule[K].

tcanta Dye TanninA red dye is obtained from the root, it is similar to Rubia cordifolia[61]. The root contains 25 - 32% tannins[272].

dwatta Antibacterial AstringentThe whole plant is antibacterial and astringent[145, 174, 218]. It is prescribed in the treatment of nervous diseases, numbness of the limbs, pains, rheumatism, renal diseases etc[218, 240]. The juice of the plant is valued in treating renal diseases[272].

nrakta E. Asia - China to the Himalayas. ksacta Semishaded scrubby slopes and in forests, 1500 - 2300 metres in the Himalayas [145].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

# 7.2.410 Bromus rigidus

Ripgut Brome

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Bromus rigidus is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind, Cleistogony (self-pollinating without flowers ever opening). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed[161, 177]. Used as a piñole, or dried then ground into a powder and mixed with water to make a gruel[257]. The seed is small and would be rather fiddly to use[K].

nrakta Southern and western Europe, including Britain, to N. Africa. ksacta Waste places on sandy shores in the Channel Islands, a casual in other parts of Britain[17].

propta Seed - sow spring or autumn in situ and only just cover. Germination should take place within 2 weeks.

nwatta Succeeds in ordinary well-drained garden soil in a sunny position[138, 200]. The plant has cleistogamous flowers, these flowers do not open but produce seed by means of self-fertilization.

## 7.2.411 Eupatorium chinense

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 1.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Eupatorium chinense is a PERENNIAL growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe young leaves are used as a flavouring[177].

tcanta The powdered plant is used in Nepal to prepare marcha, a fermenting cake from which liquor is distilled[272].

dwatta Anodyne Carminative Diuretic Nervine Vermifuge Women's complaintsThe leaves are anodyne, carminative, diuretic, nervine and vermifuge[218]. An infusion is used in the treatment of colds, diphtheria and rheumatoid arthritis[238]. The leaves and stems are harvested in the summer before the flower buds open, and are dried for later use[238]. The seed is prescribed in China for the '36 diseases of women'[218]. The root is considered to be beneficial to the circulation and a restorative to women after parturition[218]. The roots are harvested in the autumn and dried for later use[238]. The milky latex is applied to treat goitre[272].

nrakta E. Asia - China, Japan, Korea. ksacta Mountains all over Japan. Open and deforested areas at elevations of 2000 - 2600 metres in Nepal[272].

propta Seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Succeeds in ordinary well-drained but moisture retentive garden soil in sun or part shade[200]. Plants seem to be immune to the predations of rabbits[233]. A polymorphic species[58].

# 7.2.412 Dracocephalum parviflorum

American Dragonhead

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Dracocephalum parviflorum is a ANNUAL/BIENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: CondimentSeed[105, 161, 177, 257]. No more details. The leaves have been used as a flavouring[257].

dwatta Febrifuge OphthalmicThe plant has been used to treat diarrhoea in children[257]. The leaves are febrifuge and ophthalmic[257]. A cold compound infusion has been used in the treatment of fevers and headaches[257]. Externally, it has been used as an eyewash[257].

nrakta N. America - Quebec and Ontario to Alaska, New York, Iowa, Missouri and Arizona. ksacta Dry, rocky or gravelly calcareous soils, often in recent clearings[43].

propta Seed - sow early spring in situ. Pinch back the shoot tips in May in order to encourage bushy growth[200].

nwatta Succeeds in a sunny position in a fertile well-drained soil[200]. The plant is very fragrant[200]. It is useful for filling gaps in the summer border[200].

### 7.2.413 Paeonia ostii

Tree Peony 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Paeonia ostii is a deciduous Shrub growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-ertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: The following use is for P. suffruticosa. It quite probably also applies to this closely-related species. [K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes [183].

dwatta Analgesic Antibacterial Antiinflammatory AntispasmodicA tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250]. The following uses are for P. suffruticosa. They quite probably also apply to this closely related species.[K - see 214]. The root and root bark is analgesic, antibacterial, anti-inflammatory, antipyretic, antispasmodic, emmenagogue, sedative, styptic and tonic[46, 61, 174, 176, 178, 218]. An extract of the plant has antibacterial activity[218]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - China in Shaanxi and Heenan. ksacta Deciduous broad-leaved forests, thickets on slopes at elevations of 800 - 1600 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°c[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. A very ornamental plant[1]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, so are best sited in a position that is shaded from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with

and the seeds ripen in August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but without much flavour[225]. The fruits vary in colour from white to blue or sea-green[225]. The fruit is seldom borne in Britain[208]. The fruit is about 12mm wide[200]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153]. A dense carpeting plant, it can be planted about 25cm apart to form a ground cover[208]. The cultivar 'Violet Drops' is much more vigorous than the type, forming compact mats up to 2 metres across and making a very good ground cover[225].

nrakta New Zealand. ksacta Lowland to higher montane grassland, stream margins, rocky places and dry river beds on North and South Islands[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils, so long as they are well-drained[225]. This plant has survived very dry conditions with us and appears to be very drought tolerant[K]. One of the hardiest members of this genus, it succeeds outdoors in the rock garden in many parts of the country[1]. Hybridizes freely with other members of this genus[200, 225], though it does not seem to cross with C. pumila, C. atropurpurea or any red-fruited species[225]. There are several named forms selected for their ornamental value[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

#### 7.2.439 Sedum forsterianum

Stonecrop

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum forsterianum is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. pcista Although not poisonous, if large quantities of this

pcista Although not poisonous, if large quantities of this plant are eaten it can cause a stomach upset[62, 85].

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 46, 105, 115].

nrakta Western Europe, including Britain, south and east from the Netherlands to Morocco and W. Germany. ksacta A very local plant in Britain, growing on rocks and screes on dry soils to elevations of 360 metres[17].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any

time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are drought tolerant[200]. Can be grown on a wall[200]. Requires a sunny position[188]. Hardy to about -15°c[200]. This species is closely related to S. reflexum. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233].

## 7.2.440 Farfugium japonicum

Leopard Plant

6 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Farfugium japonicum is an evergreen Perennial growing to 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from November to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Leaf stems -cooked[46, 61, 177]. The leaf stems are boiled in water to remove a bitter taste, the outer peel is removed and they are then added to salads, soups etc[183].

dwatta Antidote PoulticeThe leaves are antidote[218]. They are taken internally to treat fish poisoning and externally to treat lacquer poisoning[218]. They are also applied to suppurating abscesses and pox[218].

nrakta E. Asia - C. and S. Japan. ksacta Rocky cliffs near sea shores[58, 275]. In the long grass of streamside meadows[200]. Lower elevational forests, grassy slopes and valleys in China[266].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Landscape Uses:Border, Foundation, Massing, Specimen, Woodland garden. Prefers a deep moist fertile humus-rich soil[200]. Requires a sheltered position[166]. Plants often wilt on bright sunny days if they are growing in a sunny position[200]. This species is not very hardy, tolerating temperatures down to between  $\cdot 5$  to  $\cdot 10^{\circ} ([200]$  and succeeding outdoors in a woodland garden in the milder areas of Britain[166]. A good plant for growing in a window[1]. There is possibly some confusion, in the references quoted, between this species and Ligularia japonica[K]. Special Features: Attractive foliage, Attracts butterflies.

#### 7.2.441 Ruscus aculeatus

Butcher's Broom - Knee Holly

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 0.8 m hkuc pcimhmim cyutli hgatkyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Ruscus aculeatus is an evergreen Shrub growing to 0.8 m (2ft 7in) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to April, and the seeds ripen from August to March. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in

drutta Scabiosa japonica is a BIENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Leaves RootEdible Uses: Leaves cooked. Eaten boiled[105, 177]. Root[105, 177, 179]. No more details are given.

nrakta E. Asia - Japan, ksacta Sunny grassy slopes in mountains all over Japan[58].

propta Seed - sow spring in a cold frame. The seedlings are subject to damping off[1] so water with care and make sure to give adequate ventilation. Prick out the seedlings into individual pots once they are large enough to handle and plant them out into their permanent positions in the summer.

nwatta Prefers a neutral or alkaline soil and a sunny position[200]. Succeeds in ordinary garden soil[1]. Requires a well-drained soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 7.2.435 Chionographis japonica

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Chionographis japonica is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and 7.2.437 Eragrostis pilosa young plants[177]. No more details are given.

nrakta E. Asia - C. and S. Japan, Korea. ksacta Not known

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse as soon as it is ripe if possible otherwise in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or after flowering in the summer.

nwatta Prefers a moisture-retentive but well-drained humus-rich loamy soil and a position in light dappled shade[1, 200]. It is well suited to the woodland garden[200]. Plants are hardy to about -15°c but they often require some protection in the winter, especially in areas where cold temperatures are prolonged[200].

# 7.2.436 Artemisia capillaris

6 tlin 9 cvuc 1 kcak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Artemisia capillaris is a deciduous Shrub growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

pcista Although no reports of toxicity have been seen for this species, skin contact with some members of this genus can cause dermatitis or other allergic reactions in some people[222].

kcakta Edible Parts: LeavesEdible Uses: Leaves and stems - soaked and boiled[177].

dwatta Antibacterial Anticholesterolemic Antiviral Cholagogue Diuretic Febrifuge Hepatic VasodilatorYin Chen Hao has been used in Chinese herbal medicine for over 2,000 years. It is considered to be a bitter and cooling herb, clearing "damp heat" from the liver and gall ducts and relieving fevers[254]. It is an effective remedy for liver problems, being specifically helpful in treating hepatitis with jaundice[254]. Modern research has confirmed that the plant has a tonic and strengthening effect upon the liver, gallbladder and digestive system[254]. The leaves and young shoots are antibacterial, anticholesterolemic, antiviral, cholagogue, diuretic, febrifuge and vasodilator[147, 176, 178, 218]. An infusion is used internally in the treatment of jaundice, hepatitis, gall bladder complaints and feverish illnesses[238]. Externally it has been applied in the form of a plaster for treating headaches[254]. The plant is harvested in late spring and can be dried for later use[238]. Yin Chen Hao is contraindicated for pregnant women[254].

nrakta E. Asia - China, Japan, Korea, Manchuria. ksacta Grassy thickets[147], and along rivers and seashores, C. and S. Japan[58]. Humid slopes, hills, terraces, roadsides and river banks at elevations of 100 - 2700 metres in China[266].

propta Seed - surface sow from late winter to early summer in a greenhouse[200]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Cuttings of half-ripe wood, July/August in a frame. Division in spring or autumn.

nwatta An easily grown plant, succeeding in a welldrained circumneutral or slightly alkaline loamy soil, preferring a sunny position[1, 200]. Established plants are drought tolerant[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. This species is probably not hardy in all parts of Britain, it tolerates temperatures down to at least -5°c[238]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing

Soft Love Grass, Indian lovegrass 6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Eragrostis pilosa is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - ground into a flour and used as a cereal[105]. It is generally seen as a famine food, but is used regularly in some areas[177]. The seed is very small and fiddly to utilize[K].

dwatta VulneraryThe plant is said to be an effective cure for contusions[218].

nrakta Warm Temperate regions. ksacta Roadsides, waste places and old fields[43].

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out after the last expected frosts. The seed can also be sown in situ in mid to late spring, though in a cool summer it may fail to ripen many seeds[162].

nwatta Succeeds in any good loam or humus-rich soil in a sunny position[162]. Prefers a light soil[1]. Plants are harvested (from the wild?[K]) on a regular basis in E. Africa for their edible seed[177].

# 7.2.438 Coprosma petriei

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nvanhien hionli

drutta Coprosma petriei is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, other species if these flower nearby at the same time[250]. 61, 177]. The fallen flower petals are parboiled and sweet-Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Commonly cultivated in China as a medicinal plant, the cultivar 'Phoenix White' has especially vigorous roots and so is the favoured form for medicinal

### 7.2.414 Crocosmia aurea

Monthretia

6 tlin 9 cvuc 1 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Crocosmia aurea is a CORM growing to 1 m (3ft 3in) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: Colouring A yellow dye is obtained from the flowers and used as a saffron substitute for colouring foods[61, 177, 183].

nrakta S. Africa. ksacta Shady forest areas in moist country, 2000 - 2500 metres from East Cape province and north to Mozambique, Malawi etc[79]. Especially common in conifer plantations[90].

propta Seed - best sown as soon as it is ripe in a cold greenhouse[1]. The seed usually germinates in 3 - 9 weeks at 20 - 25°c[164]. Stored seed can be sown in early spring in a greenhouse[164]. Sow the seed thinly so that the plants can be grown on undisturbed in their pot for the first year, but give the seedlings an occasional liquid feed to ensure they do not become nutrient deficient. Once the plants are dormant in the autumn, pot up the bulbs putting 2 - 3 bulbs in each pot. Grow them on for another year or two in the greenhouse before planting them out when they are dormant in the autumn. Division in spring as new growth commences[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta A very easily grown plant, it succeeds in almost all soils other than very heavy clays or bogs[233], though it prefers a light rich sandy soil[1, 79] in full sun or light dappled shade[200, 233]. Another report says that it prefers a fairly shady position and plenty of moisture in the growing season[79]. The corms are hardy to about -10°c[200] but in cold areas it is wise to lift them when the plants die down in the autumn, store them in a cool frost-free place over the winter and plant them out in the spring[1]. Make sure the corms do not dry out[1]. It is best to avoid lifting the corms if at all possible since the new corms seem to derive some nutrition from the old corms that have flowered[200]. Plants can divide quite freely when growing in a suitable location[233]. Although the fresh flowers have no perfume, when dried and immersed in warm water they release a scent like that of the saffron crocus[245]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

### 7.2.415 Paeonia szechuanica

Tree Peony

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Paeonia szechuanica is a deciduous Shrub growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: The following use is for P. suffruticosa. It guite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, ened for a teatime delicacy, or cooked in various dishes[183].

dwatta Analgesic Antibacterial Antiinflammatory AntispasmodicA tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250]. The following uses are for P. suffruticosa. They quite probably also apply to this closely-related species.[K - see 214]. The root and root bark is analgesic, antibacterial, anti-inflammatory, antipyretic, antispasmodic, emmenagoque, sedative, styptic and tonic[46, 61, 174, 176, 178, 218]. An extract of the plant has antibacterial activity[218]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner[238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218].

nrakta E. Asia - China in north-west Sichuan. ksacta Woodland edges in mountains at altitudes of 2,640 - 3,100

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance [250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1]. Prefers a limy soil and a sheltered position[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Hardy to about -20°c[184], plants do better in the north of Britain than they do in the south and are generally best if given an open northerly aspect[11]. A very ornamental plant[1]. It grows best in areas with long hot summers[1] and requires an airy position because it is very subject to fungal attack[11]. Plants in this genus are notably susceptible to honey fungus[200]. Plants come into growth early in the year and are then subject to damage by late frosts, it is therefore best to site them in a position with shade from the early morning sun[11]. The branches are brittle and very subject to wind damage, especially when young[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. The plant does not really need much pruning apart from removing dead or diseased stems. It is, however, very tolerant of pruning and can be cut right back to ground level if it requires rejuvenation[200]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1]. Cultivated in China as a medicinal plant[214].

# 7.2.416 Paeonia lutea

Tree Peony, Dian mu dan

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli fvifxre7t hionli

drutta Paeonia lutea is a deciduous Shrub growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is selffertile. Suitable for: light (sandy), medium (loamy) and heavy

(clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: The following use is for P. suffruticosa. It quite probably also applies to this closely-related species.[K - see 214]. Flowers - cooked[46, 61, 177]. The fallen flower petals are parboiled and sweetened for a teatime delicacy, or cooked in various dishes[183].

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Cholera DysenteryThe bark obtained from the root has an antimicrobial effect upon various bacteria, including Escherichia coli, typhoid, cholera, Staphylococcus aureus, streptococcus hemolyticus and Pneumococci[250]. The root is also anti-inflammatory and has been used with success in the treatment of arthritic joint swelling[250]. The root is also analgesic, sedative and anticonvulsant, it has a high success rate in the treatment of dysentery and can also be used to treat allergic rhinitis[250]. The plant is used internally in the treatment of fevers, boils, menstrual disorders, nosebleeds, ulcers, irritability and gastro-intestinal infections[238]. This remedy should only be used under the supervision of a qualified practitioner [238]. The herb acts as a synergist when used with liquorice (Glycyrrhiza spp)[218]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - S.W. China. ksacta Spruce forests and the edge of scrub in open pastures at altitudes of 3,300 -4 000 metres[250]

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. ## 7.2.417 Arisaema consanguineum

Tian Nan Xing

6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 1 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Arisaema consanguineum is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The plant contains calcium oxylate crystals. These cause an extremely unpleasant sensation similar to needles being stuck into the mouth and tongue if they are eaten but they are easily neutralized by thoroughly drying or cooking the plant or by steeping it in water.

kcakta Edible Parts: LeavesEdible Uses: Leaves - boiled and used as a vegetable[272]. Some caution is advised, see the notes above on toxicity.

dwatta Anodyne Antibacterial Anticoagulant Antifungal Antiinflammatory Antiphlogistic Antirheumatic Antispasmodic Antitumor Epilepsy Expectorant Sedative Stomachic-Tian Nan Xing has been used in Chinese herbal medicine for thousands of years and is valued especially for its beneficial affect upon the chest[254]. When prescribed internally it is always used dried and in conjunction with fresh ginger root[254]. The root is an acrid irritant herb that is anodyne. antibacterial, antifungal, antiphlogistic, antirheumatic, anticancer, antispasmodic, antitumor, expectorant, sedative and stomachic[147, 176, 218, 238]. The dried root is used internally in the treatment of coughs with profuse phlegm, tumours, cervical cancer, epilepsy, tetanus and complaints involving muscular spasms[176, 238]. The fresh root is applied externally as a poultice to ulcers and other skin complaints[254]. The root is harvested when the plant is dormant in the autumn or winter and is dried for later use[238]. The whole plant is anticoagulant, anti-inflammatory, antispasmodic and anodyne[218].

nrakta E. Asia - Himalayas to S.W. China ksacta Damp shady pine and mixed forests, shrubberies and grassy slopes at elevations of 1800 - 3300 metres in the Himalayas 51, 147,

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a coupe of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool peaty soil in the bog, woodland garden or a sheltered border in semi-shade[200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This species requires a warm corner in British gardens[233]. Plants are nearly hardy in Britain, they normally succeed outdoors in the milder areas of the country[1]. They tolerate temperatures down to about -10°c[90], though the young growth can be damaged by spring frosts[238]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

# 7.2.418 Ipomopsis aggregata

Skyrocket, Scarlet gilia 6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 1 m hkuc eyes[257]. A powder of the dried and ground root can be used as a dressing on cuts, wounds, burns and sores[257]. A poultice of the crushed roots has been used to treat boils, deep cuts and wounds[257]. A cold infusion of the seeds has been used as a cough medicine[257]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta Western N. America - California to Nevada and Washington. ksacta Sagebrush desert and ponderosa pine forest at altitudes of 900 - 1800 metres[60].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species requires an extremely well-drained soil[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. A very cold-hardy plant, tolerating temperatures down to about -30°c[250]. A long-lived plant, specimens can survive in the garden for at least 50 years[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

### 7.2.432 Aletris farinosa

Unicorn Root - Colic Root, White colicroot 6 tlin 9 cyuc 1 kcak 0 tcan 3 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hionli

drutta Aletris farinosa is a PERENNIAL growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil

pcista The fresh root is mildly poisonous[21] causing abdominal discomfort (hypogastric). May lead to colic, diarrhoea and vomiting. As used to treat amenorrhoea avoid during pregnancy [301].

kcakta Edible Parts: RootEdible Uses: Bulb cooked[105, 161, 177]. Intensely bitter[2]. A bitter-sweet soapy taste[238].

dwatta Antiflatulent Antiinflammatory Appetite Stimulants Appetizer Bitter Diuretic Dysentery Narcotic TonicThe greatest value of unicorn root is its tonic influence on the female generative organs, proving to be of great use in treating cases of habitual miscarriages[4]. Used for gynaecologi-

An infusion of the root has been used as a wash for sore cal disorders or 'female complaints' in the US including dysmenorrhoea, amenorrhoea and prolapsed vagina complaints [301]. It also promotes the appetite and is used in the treatment of diarrhoea, rheumatism and jaundice[222]. The root is bitter, diuretic, narcotic and tonic[1, 21, 46, 213]. Only use the dried rootstock[21], in large doses the fresh root is somewhat narcotic, emetic and cathartic[4]. A decoction of the root is a bitter tonic and has been used for expelling flatulence and for various uterine disorders[207, 222]. It is used in the treatment of colic, though small doses, especially of the fresh root[4], can cause hypogastric colic[222]. The root is harvested in late summer after flowering and dried for later use[238]. The root contains diosgenin, which has both antiinflammatory and oestrogenic properties[222]. A tea of the leaves has been used in the treatment of colic, stomach disorders, dysentery and bloody dysentery[213, 257].

nrakta South-eastern N. America - Southern Maine to Florida, west to Texas and Wisconsin, ksacta Grassy or sandy woodlands, in dry or moist peats, sands and gravels, especially on the seashore[4, 21, 43]

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in early spring. Sow the seed thinly to allow the seedlings to be grown on for their first year without potting them up, but give a liquid feed from time to time to ensure that they do not become nutrient deficient. Prick the young plants out into individual pots the following spring and grow them on in the greenhouse for the next winter. Plant them out into their permanent positions in early summer. Division in spring.

nwatta Prefers a damp sunny position in peat, leafmold and sand[1]. Requires a sunny position[200]. Plants are hardy to between -10 and -15°c[200].

# 7.2.433 Saxifraga cortusifolia

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.4 m hkuc hmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Saxifraga cortusifolia is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[177].

nrakta E. Asia - Japan. ksacta Wet shaded places, especially on rocks and along streams in mountains, C. and S. Japan[58].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Prefers a cool position in a moist humus-rich soil[1]. Prefers an acid soil[200]. Grows well in light woodland[200] or in a shady position in the rock garden. This species is not very hardy in Britain according to one report[1], whilst another says that it is in climatic zone 7 and should therefore succeed outdoors in most parts of this country[200]. However, the leaves and the flowers are liable to be frost-damaged by autumn frosts[200]. A polymorphic species[1], it is closely related to S. stolonifera, differing in not having runners[200].

# 7.2.434 Scabiosa japonica

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

has creeping rhizomes[266]. There has been some confusion between this species and A. crenata, the name Ardisia crispa was misapplied by de Candolle to Ardisia crenata[266].

### 7.2.428 Potentilla glandulosa

Gland Cinquefoil, Sticky cinquefoil, Arizona cinquefoil, Ashland cinquefoil, Ewan's cinquefoil, Hans

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Potentilla glandulosa is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaA tea-like beverage is made by boiling the leaves or the whole plant in water[61, 11, 177, 183].

dwatta Astringent Stimulant TonicAll parts of the plant are astringent[257]. An infusion has been drunk, and a poultice of the plant applied externally in the treatment of swollen parts[257]. An infusion of the plant has been used as a stimulant and tonic[257].

nrakta Western N. America. ksacta Rocky hillsides, Black Hills on Sioux quartzite in eastern South Dakota.

propta Seed - sow early spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Easily grown in a well-drained loam, preferring a position in full sun but tolerating shade[1]. Prefers an alkaline soil but tolerates a slightly acid soil[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 7.2.429 Thymus cilicicus

Cilician Thyme

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.2 m hkuc

htut cyutli kyuctcup hwicli hrasilut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Thymus cilicicus is an evergreen Shrub growing to 0.2 m (0ft 8in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe leaves have a lemon scent and are used as a flavouring in food[238].

tcanta Deodorant Disinfectant EssentialAn essential oil is obtained from the leaves.

dwatta Antiseptic Deodorant DisinfectantThe leaves, and especially the essential oil contained in them, are strongly antiseptic, deodorant and disinfectant[200, 238]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

nrakta W. Asia. ksacta Not known

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[200]. This species thrives in stony situations[238]. Plants tolerate occasional walking on and can be grown in cracks in paths, they also succeed on walls[200]. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. Plants are hardy to at least -10°c[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

## 7.2.430 Carduus crispus

Welted Thistle, Curly plumeless thistle 6 tlin 9 cvuc 1 kcak 1 tcan 1 dwat 0.9 m hkuc htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Carduus crispus is a BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought.

pcista The root may be slightly toxic[178]. kcakta Edible Parts: Leaves OilEdible Uses: OilYoung leaves - cooked[105]. An emergency food, used when all else fails[177].

tcanta OilThe seed of all species of thistles yields a good oil by expression[4]. No details of potential yields etc are given[K]. A favorite foodplant of caterpillars of the Painted Lady butterfly (Vanessa cardui).

dwatta Alterative AnodyneThe root is alterative and anodyne[178, 218].

nrakta Europe to Asia. A rare casual in Britain[17]. ksacta Waste ground, cultivated fields and roadsides in Japan[58].

propta Seed - sow spring in situ.

nwatta Succeeds in a sunny position in ordinary garden soil[1, 200]. This species is closely related to C. acanthoides[17].

# 7.2.431 Paeonia brownii

Brown's Peony

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Paeonia brownii is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root. A liquorice flavour[105, 161].

tcanta BeadsThe seeds can be used as beads in necklaces etc[257].

dwatta Antitussive Cardiac Febrifuge Laxative Pectoral Poultice TBThe root is cardiac, febrifuge, laxative and pectoral[257]. A decoction has been used by some native North American Indian tribes in the treatment of pneumonia, tuberculosis, VD, nausea, indigestion, coughs, diarrhoea and kidney troubles[207, 257]. A decoction of the sun-dried roots has been used to help people put on weight[257]. A decoction of the root has been used as a liniment on swellings[257].

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis 7.2.420 Cucubalus baccifer hpa7tmwatli xre7t hjonli

drutta Ipomopsis aggregata is a BIENNIAL/PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: NectarEdible Uses: TeaThe plant has been boiled up as a tea[257]. The nectar is sucked from the flowers by children[257].

tcanta Adhesive Disinfectant SoapThe plant is reported to contain saponins[212] and so could possibly be used as a soap substitute[K]. A decoction of the plant has been used as a face and hair wash by adolescent girls[257]. The whole plant has been boiled up to make a glue[257].

dwatta Cathartic Disinfectant Emetic Skin TonicThe whole plant is cathartic and emetic[61, 257]. The leaves are steeped in hot water until the water turns a bright green, this liquid is taken in small doses as a tonic for the blood[207, 257]. An infusion of the whole plant has been used to treat blood diseases[257]. A decoction has been used as a disinfectant wash on itchy skin[257]. A poultice of the whole plant has been applied to rheumatic joints[257]. An infusion of the roots is used as a laxative and in the treatment of high fevers, colds[257].

nrakta Western N. America - Oregon to California to Texas, north to N. Dakota, ksacta Dry rocky slopes in sagebrush, scrub and clearings in pine forests to 3000 metres in California[187].

propta Seed - sow spring in situ[200].

nwatta Requires a well-drained dry soil in sun or partial shade[187]. Requires a light very well drained fertile soil in full sun[200]. Plants are cold-hardy to about -15°c[187], but they are susceptible to rot in areas with wet winters[260]. It is best to cover the plants with a pane of glass in wet winter areas[260]. A slow-growing[188] and short-lived perennial or biennial species[187]. A polymorphic species[60]. The leaves have a musky scent[187]. The crushed leaves smell like a skunk[212]

### 7.2.419 Carex paniculata

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Carex paniculata is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June, and the seeds ripen from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta Edible Parts: Root SeedEdible Uses: Root cooked[172]. Seed[172]. No further details are given, but the seed is small and fiddly to use[K].

tcanta BeddingThe straw is used for bedding[61].

nrakta Most of Europe, including Britain, north to 62° N., W. Asia and N. America. ksacta Wet, often shady places, on peaty base-rich soils[17].

propta Seed - sow in situ in the spring in a moist soil in light shade. If seed is in short supply it can be sown in a cold frame and be planted out in the summer. The seed usually germinates in 2 - 6 weeks at 15°c[138]. Division in spring[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring.

nwatta Easily grown in a damp to wet soil in full sun or shade[162, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

Berry-Bearing Catchfly

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli

drutta Cucubalus baccifer is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and young plants - cooked[177, 179].

tcanta TanninThe plant is rich in tannin[179]. dwatta StypticA decoction of the plant is used in the treatment of haemorrhages[218, 240].

nrakta S. Europe to W. Asia. ksacta Damp shady habitats in scrub and woodland[200].

propta Seed - sow spring in situ.

nwatta See the plants native habitat for ideas on its cultivation needs. Plants are hardy to between -10 and -15°c[200].

# 7.2.421 Scirpus cyperinus

Woolly Grass Bulrush, Woolgrass

6 tlin 9 cvuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc

hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Scirpus cyperinus is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. Used as a rice substitute[178].

tcanta Stuffing WeavingThe stems are woven to make matting and ropes[178]. The small rushes have been used in making woven mats and storage bags[257]. The fruiting tops of the plant have been used as a resilient material for stuffing and making pillows[257].

nrakta Eastern N. America - Newfoundland to Saskatchewan, south to Florida and Louisiana. ksacta Wet low ground[60]. Swamps[235]. Marshes, moist meadows, ditches, shallow ponds, frequently growing in disturbed areas from sea level to 800 metres[270].

propta Seed - sow in a cold frame as soon as it is ripe in a pot standing in 3cm of water. Only just cover the seed with soil[200]. The seed usually germinates fairly quickly. Prick out the plants when large enough to handle and plant out in their permanent positions in early summer. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in any wet to moisture retentive ground, pond margins and shallow water in full sun or shade[200]. A polymorphic species[60].

### 7.2.422 Ribes lobbii

Gummy Gooseberry

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1.8 m hkuc

htut cvutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ribes lobbii is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[101, 105, 161, 257]. Generally considered to be unpalatable, but they were occasionally eaten by some native North American Indian tribes[256].

tcanta Needles StringThe roots have been boiled with cedar (Juniperus spp, Thuja sp.) and wild rose (Rosa spp) roots, then pounded and woven into rope[257]. The sharp thorns have been used as probes for boils, for removing splinters and for tattooing[257].

dwatta Astringent Poultice SalveThe root has been used in the treatment of diarrhoea[257]. A poultice of the roots and salt water has been applied to mouth sores, body sores, blisters and carbuncles[257]. The root ash, mixed with oil, has been used as a salve on boils[257].

nrakta Western N. America - southern British Columbia to northern California. ksacta Creek banks and lowland valleys to open or forested mountain slopes[60].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 3 months cold stratification at between 0 and 5°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth, November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but well-drained loamy soil of at least moderate quality[11, 200]. Requires a sunny position[11]. Hardy to about -20°c[200]. A very ornamental plant[60], it is closely related to R. menziesii[1]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.423 Vaccinium bracteatum

Sea Bilberry

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hionli

drutta Vaccinium bracteatum is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177, 183]. The fruit is about 6mm in diameter[200].

dwatta Cancer The plant has been used in the treatment of cancer [218].

nrakta E. Asia - China, Japan, Korea. ksacta Low elevations in mountains, C. and S. Japan[58]. Forests and thickets at elevations of 400 - 1400 metres[266],

propta Seed - sow late winter in a greenhouse in a limefree potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade

though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants are hardy at Kew but they are better grown in milder areas[11]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Closely related to V. sprengelii[182]. Plants in this genus are notably resistant to honey fungus[200].

# 7.2.424 Eragrostis curvula

Weeping Love Grass

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Eragrostis curvula is an evergreen Perennial growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Apomictic (reproduce by seeds formed without sexual fusion), wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed -cooked[269]. Used as a grain[269].

tcanta Basketry Biomass Soil stabilizationA deep-rooted plant, it is considered excellent for protecting terraces and for grassing water channels and is valuable for erosion control[269]. In Lesotho, the plant is used to make baskets, brooms, hats, ropes, and candles[269].

nrakta S. Africa - north to Zimbabwe and the Transvaal. ksacta Not known

propta Seed - sow early spring in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out after the last expected frosts. The seed can also be sown in situ in mid to late spring, though in a cool summer it may fail to ripen many seeds[162]. Division in spring.

nwatta Easily grown in most well-drained soils so long as the plant is in a hot, dry, sunny position[200]. Weeping love grass is reported to tolerate an annual precipitation of 31 to 163cm, an annual temperature range of 5.9 to 26.2°C and a pH in the range of 5.0 to 8.2[269]. It is adapted to semi-arid and desert areas and sandy soils, growing well on low fertility soils[269]. A very drought-resistant plant, but it lacks hardiness for more northern areas[269]. It grows well on a wide range of well-drained soils, especially sandy loams; moderately frost-resistant in southern areas[269]. Plants are hardy to about -5°c and succeed outdoors in the milder areas of Britain[200]. The roots contain pyrocatechol, suggesting an explanation for the plants resistance to nematodes[269]. The species and its varieties are apomictic (producing seed without fertilization) although sexual plants have occasionally been found[269].

# 7.2.425 Skimmia laureola

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Skimmia laureola is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to June. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

pcista A poisonous alkaloid called 'skimmianin' is found in all parts of the related S. japonica, it is probably also present in this species[211].

kcakta Edible Parts: LeavesEdible Uses: CondimentLeaves - cooked. Used as a condiment[272]. The

strongly aromatic leaves are used in curries or as a flavouring for other foods[146, 177, 183].

tcanta Essential Incense WoodAn essential oil in the leaves is used in scenting soap[61, 240, 272]. The dried leaves are used as an incense[61, 145, 211]. The fresh leaves are used to make garlands for weddings[211]. Plants can be grown as a ground cover when planted about 1 metre apart each way[208]. Wod - used to make handles of small farming implements such as hoes and axes[272].

dwatta The leaves are used in the treatment of small-pox[240]. The smoke produced by burning them is said to purify the air[240].

nrakta E. Asia - N.W. Himalayas to N. China. ksacta An undershrub in rocky places in oak and fir forests, 2400 - 3600 metres from C. Nepal to N. China[51, 146, 184].

propta Seed - can be sown as soon as it is ripe in a cold frame[K]. It also succeeds when sown in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If there is sufficient seed then it can be sown can be in an outdoor seedbed in early spring[200]. Grow the plants on in the seedbed for a couple of years before planting them out in late autumn or early spring. Cuttings of half-ripe wood, July/August in a cold frame[11]. Cuttings of nearly mature side shoots, 7 - 10cm with a heel, September in a cold frame. Slow to root, they should be left for 18 months before moving to their permanent positions. Good percentage[78]. Layering in autumn. Takes 18 months. Good to high percentage [78].

nwatta Succeeds in a well-drained open loam or in a peaty soil in a sunny position[1]. Probably flowers well in the shade[11]. Plants are very tolerant of atmospheric pollution, being unharmed by deposits of soot or a sulphurladen atmosphere[245]. This species is not very frost-hardy and so is rather tender in much of Britain[1]. The flowers are sweetly scented[184]. The small yellow flowers are oppressively scented, giving a somewhat unpleasant smell near to, though agreeable at a distance[245]. The bruised leaves are strongly aromatic[245]. The plant is superficially similar to Daphne cannabina and is often mistaken for that species[211]. Dioecious. Male and female plants must be grown if seed is required.

#### 7.2.426 Convza canadensis

Canada Fleabane, Canadian horseweed 6 tlin 9 cyuc 1 kcak 1 tcan 3 dwat 1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasilut hpa7tli pr

hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli hionli

drutta Conyza canadensis is a ANNUAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to October, and the seeds ripen from July to October. The species is monocious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista Skin contact with the plant can cause dermatitis in some people[222].

kcakta Edible Parts: LeavesEdible Uses: CondimentYoung leaves and seedlings - cooked[105, 177]. Boiled, cooked in rice or dried for later use[183]. A nutritional analysis of the leaves is available[218]. The source of an essential oil that is used commercially for flavouring sweets, condiments and soft drinks[183]. The fresh leaves contain 0.2 - 0.66% essential oil[218].

tcanta EssentialThe plant contains small quantities of essential oil[7]. Since the plant is readily obtainable, extraction of the oil is feasible - it has a special quality that would make it suitable in the making of perfumes with unusual nuances[7, 240].

dwatta Astringent Diuretic Dysentery Emmenagogue Homeopathy Hypoglycaemic Styptic Tonic VD Vermifugeln traditional North American herbal medicine, Canada fleabane was boiled to make steam for sweat lodges, taken as a snuff to stimulate sneezing during the course of a cold and burned to create a smoke that warded off insects[254]. Nowadays it is valued most for its astringency, being used in the treatment of gastro-intestinal problems such as diarrhoea and dysentery[254]. It is said to be a very effective treatment for bleeding haemorrhoids[254]. The whole plant is antirheumatic, astringent, balsamic, diuretic, emmenagogue, styptic, tonic and vermifuge[4, 7, 9, 21, 222]. It can be harvested at any time that it is in flower and is best used when fresh[4, 207, 238]. The dried herb should not be stored for more than a year[238]. The seeds can also be used[4]. An infusion of the plant has been used to treat diarrhoea and internal haemorrhages[213] or applied externally to treat gonorrhoea[213] and bleeding piles[7]. The leaves are experimentally hypoglycaemic[218]. The essential oil found in the leaves is used in the treatment of diarrhoea, dysentery and internal haemorrhages[4, 207, 218]. It is a uterine stimulant[213] and is also said to be valuable in the treatment of inflamed tonsils plus ulceration and inflammation of the throat[4]. A tea of the boiled roots is used to treat menstrual irregularities[213]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of haemorrhoids and painful menstruation[9].

nrakta N. America. Naturalized in Britain[17]. ksacta Light soils on waste and cultivated land, also on walls, avoiding acid soils in Britain[17].

propta Seed - we have no information on this species but suggest sowing the seed in spring in situ. An autumn sowing in situ might also be worthwhile.

nwatta Prefers a well-drained light or medium neutral to alkaline soil in a sunny position, though it tolerates most conditions[238]. Originally from N. America, Canada fleabane has become naturalized in many areas of the world and is considered to be a nuisance weed in many areas[268]. The plant is very adaptable to differing conditions and can vary dramatically in height, from only a few centimetres in poor soils to as much as 3 metres tall in rich soils[213]. The plant is used commercially as a food flavouring[183]. A good bee plant[200] but unfortunately it also harbours various insect pests such as the tarnished plant bug[1].

# 7.2.427 Ardisia crispa

6 tlin 9 cyuc 1 kcak 0 tcan 1 dwat 1.2 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ardisia crispa is an evergreen Shrub growing to 1.2 m (4ft) by 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from September to December. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw Used in salads[218].

dwatta Antidote Diuretic PectoralThe root is antidotal and diuretic[218]. An infusion is pectoral[218]. The plant is crushed and applied to scurf, it is also applied to the ears in the treatment of earache[218].

nrakta E. Asia - S. China, Japan, India. ksacta Woods in low mountains, C. and S. Japan[58]. Mixed or broad-leaved forests, damp places, bamboo woods, hillsides and valleys at elevations of 100 - 2500 metres[266].

propta Seed - best harvested when it is ripe in the winter and sown immediately in a greenhouse[1]. Sow stored seed as early in the year as possible. When large enough to handle, prick the seedlings out into individual pots and grow them on in a shady part of the greenhouse for at least their first winter. Plant out into their permanent positions in late spring or early summer, once the plants are 20cm or more tall. Cuttings of half-ripe wood in summer[200]. Grow on in cool, shaded humid conditions until well rooted[200].

nwatta Prefers a well-drained humus rich soil in partial shade in a position sheltered from cold drying winds[200]. We are not sure if this plant is hardy outdoors in Britain. One report says that it is hardy in zone 7 (tolerating temperatures down to between -10 and -15°c) but then goes on to suggest that it is best grown in pots or tubs outdoors and moved into a cold greenhouse in the winter[200]. There are some named varieties, selected for their ornamental value[200]. The plant

propta Seed

watta Grows best in a sunny position [200]. Prefers a fertile, well-drained but moisture-retentive soil [200]. The plant grows back quickly from the base when it is cut down, and has been known to produce new growth of 15 metres within 12 months [146]. This species has a symbiotic relationship with certain soil bacteria; these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby [755].

### 8.1.17 Acacia pycnantha

Golden Wattle

tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 8 m hkuc htut cyutli kyuctcup hwicli hyishras hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Acacia pycnantha is an evergreen Tree growing to 8 m (26ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: GumFlowers - cooked[144]. Rich in pollen, they are often used in fritters. The plant yields an oily gum which is said to be edible[177, 183]. Some species produce a gum that is dark and is liable to be astringent and distasteful, but others produce a light gum and this is sweet and pleasant. It can be sucked like candy or soaked in water to make a jelly.[193]. The gum can be warmed when it becomes soft and chewable[193].

tcanta Dye Gum Soil stabilization TanninA yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. The extensive root system of this plant helps to prevent soil erosion[200]. It is often planted for this purpose on sandy banks[167]. The bark is rich in tannin[1, 171]. On a 10% moisture basis, the bark contains 40.8% tannin[223].

nrakta Australia - New South Wales, Southern Australia, Victoria. ksacta Thickets, or as an under-storey in Eucalyptus forests, especially on very poor soils[167].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a rather poor sandy loam and a very sunny position[1, 11]. Succeeds in any good garden soil that is not excessively limey and in dry soils[11]. Most members of this genus become chlorotic on limey soils[200]. Prefers a pH in the range 5.8 to 6.5. This species is not very hardy outdoors in Britain. Plants require hot, sunny summers if they are to ripen their wood fully and flower freely. In Britain they tend to do best when grown in coastal gardens in a sunny, sheltered position that is protected from the wind[11]. A fast growing but short-lived tree in cultivation[167]. It is sometimes cultivated for the tannin obtained from its bark[1, 171]. This tree is the floral emblem of Australia [167]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.18 Acacia retinodes

Swamp Wattle, Water wattle tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hjonli

drutta Acacia retinodes is an evergreen Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers SeedEdible Uses: Flowers cooked[144]. Rich in pollen, they are often used in fritters. Seed[144, 157]. No more details are given. The seedpods can be up to 18cm long[219]. Acacia seeds are highly nutritious and contain approx 26% protein, 26% available carbohydrate, 32% fibre and 9% fat[278]. The fat content is higher than most legumes with the aril providing the bulk of fatty acids present[278]. These fatty acids are largely unsaturated which is a distinct health advantage although it presents storage problems as such fats readily oxidise[278]. The mean total carbohydrate content of 55.8 + 13.7% is lower than that of lentils, but higher than that of soybeans while the mean fibre content of 32.3 + 14.3% is higher than that of other legumes such as lentils with a level of 11.7%[278]. The energy content is high in all species tested, averaging 1480+270 kJ per 100g[278]. Wattle seeds are low glycaemic index foods. The starch is digested and absorbed very slowly, producing a small, but sustained rise in blood glucose and so delaying the onset of exhaustion in prolonged exercise[278].

tcanta Dye Soil stabilizationA yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. The extensive root system of this plant helps to prevent soil erosion[200].

nrakta Australia - Victoria, New South Wales, Tasmania. Locally naturalized in S. Europe[50]. ksacta Occurs mainly in open forest in poorly drained soils inland from the coast[286].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a well-drained sandy loam and a very sumy position[1, 260], but it also stands drought and wet well[260]. Succeeds in any good garden soil, this species is said to be fairly lime tolerant[11, 166, 182, 200]. Succeeds in a hot dry position[166]. Plants are fairly tolerant of salt in the soil and salt-laden winds[260]. This species is said to be hardy from mid-Sussex southwards and westwards[1]. However, trees are not very hardy outdoors in most parts of Britain and even in the mildest areas of the country they are likely to be killed in excessively harsh winters[11]. A very ornamental tree[1]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.19 Coriaria sinica

tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Coriaria sinica is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can

## 7.2.489 Saxifraga fortunei

Saxifrag

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.4 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Saxifraga fortunei is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[105]. They are added to soups or cooked with rice[177].

nrakta E. Asia - China, Japan, Korea, Siberia. ksacta Wet shaded rocks by streams in the mountains and down to sealevel in the north of its range[187]. Forests and rock crevices at elevations of 2200 - 2900 metres in Hubei, S Jilin and Liaoning[266].

propta Seed - we have no information for this species but suggest sowing the seed in a cold frame in the spring. Surface sow, or only just cover the seed, and make sure that the compost does not dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring after the last expected frosts. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Alpine garden, Container, Ground cover, Massing, Rock garden, Woodland garden. Prefers a cool position in a moist humus-rich soil[1]. Prefers an acid soil[200]. Grows well in light woodland[200] or in a shady position in a rock garden. The plant is hardy to at least -15°c[187], the leaves and the flowers, however, are liable to be damaged by autumn frosts[200]. A polymorphic species[58], there are several named forms selected for their ornamental value[187]. Special Features:Attractive foliage, Naturalizing.

# 7.2.490 Arabis serrata

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Arabis serrata is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - cooked[177].

nrakta E. Asia - Japan. ksacta Rocky or sandy places in mountains - only found on Mt. Fuji in C. Japan[58].

propta Seed - it is best to surface sow the seed as soon as it is ripe in a light position in a cold frame[134]. Seed can also be sown in spring. It usually germinates in 2 - 3 weeks at 21°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division after flowering[111]. Very easy, the divisions can be planted out straight into their permanent positions if required. Cuttings in a shady border in summer[1].

nwatta Easily grown in ordinary well-drained soil[1]. A polymorphic species[58]. Plants are stoloniferous[1].

#### 7.2.491 Salvia carnosa

Purple Sage

6 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 0.8 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia carnosa is an evergreen Shrub growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked. Ground into a powder and used to thicken soups etc or added to cereal flours when making bread etc[105].

dwatta Analgesic Antispasmodic Febrifuge Pectoral StomachicA decoction of the seeds and stems is used to treat colds[61]. A decoction or infusion of the leaves has been used in the treatment of fevers, coughs, colds and stomach aches[257]. A poultice of the crushed leaves has been applied tot he chest to treat congestion[257]. A decoction of the leaves and stems can be drunk, used as a wash or as a steam bath in the treatment of headaches[257]. A decoction of the flowering stems has been used as a poultice and a wash to treat swollen leg veins[257]. The plant is much valued as a treatment for an epileptic or faint person, either administered as a drink or prepared like tobacco and the smoke blown into the patients face[216, 257].

nrakta South-western N. America. ksacta Dry slopes and flats, 1000 - 1500 metres in California [71].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Soils rich in nitrogen encourage excessive leaf growth at the expense of flowering[11]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 7.2.492 Ornithogalum narbonense

Star Of Bethlehem

6 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.4 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ornithogalum narbonense is a BULB growing to 0.4 m (1ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to June, and the seeds ripen from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention of this plant as being toxic has been seen, it belongs to a family where there are some species that are said to be toxic. Caution should be observed. Any toxins are likely to be concentrated in the bulb[200].

kcakta Edible Parts: RootEdible Uses: Bulb[46, 61, 177]. No further details are given, though it is probably cooked before being eaten. Some caution is advised, see the notes above on toxicity.

nrakta Europe - Mediterranean. ksacta Grassy places and waste ground[50, 90].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Sow the seed thinly and leave the seedlings undisturbed in the pots for their first dormancy, but apply liquid feed at intervals, especially in their second year of growth. Divide the bulbs at the end of their second year of growth, putting 2 - 3 bulbs in each pot. Grow them on for one more year and them plant them out into their permanent positions whilst they are dormant. The seed can also be sown in a cold frame in early spring. Division of offsets in September/October[200]. The larger bulbs can be replanted immediately into their permanent positions. It is best to pot up

the smaller bulbs and grow them on for a year before planting them out when dormant in late summer.

nwatta An easily grown plant[90], it succeeds in any position[42] in ordinary garden soil[1]. Prefers a sunny position[200]. Succeeds in short grass[90], though this should not be mown from the time the bulbs start to grow until they have set seed and the leaves are dying down. Plants are hardy to about -10°c[200].

## 7.2.493 Geum japonicum

6 tlin 9 cvuc 1 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Geum japonicum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: The plant is edible[46, 105]. No further details are given.

dwatta Astringent Diuretic PoulticeThe root is used as a poultice, applied externally to boils and ulcers[178, 218]. The whole plant is diuretic and astringent[222]. It is cooked with other foods as an astringent in the treatment of coughs and haemoptysis[218].

nrakta N. America, E. Asia, ksacta Woods and thickets in hills and low mountains all over Japan[58].

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer' Division in spring or autumn. This should be done every 3 - 4 years in order to maintain the vigour of the plant[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in any moderately good garden soil that is well-drained[1]. Prefers a soil rich in organic matter[200]. Hybridizes freely with other members of this genus[200].

# 7.2.494 Sedum spathulifolium

Broadleaf Stonecrop, Purdy's stonecrop, Yosemite stonecrop, Stonecrop, Blood Leaf Sedum

6 tlin 10 cvuc 1 kcak 0 tcan 1 dwat 0.1 m hkuc

hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli drutta Sedum spathulifolium is an evergreen Perennial

growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista Although not poisonous, if large quantities of this plant are eaten it can cause a stomach upset[62, 85].

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. They are best used before the plant flowers[172].

tcanta Can be used as a ground cover plant in a sunny position[197]. It requires weeding for the first year or so[197]. Plants are best spaced about 30cm apart each wav[208]

dwatta Antihaemorrhoidal Birthing aid Galactogogue Haemostatic Laxative Salve SedativeThe leaves are antihaemorrhoidal, galactogogue and haemostatic[257]. The leaves can be eaten, or a poultice of the warmed leaves applied to the breasts, in order to stimulate the milk flow of a nursing mother[257]. The juice of the leaves and stems has

been rubbed over bleeding wounds to stop the bleeding [257]. A decoction of the stems has been drunk by a woman in the ninth month of her pregnancy in order to ease childbirth[257]. A decoction of the whole plant has been given to children as a treatment for constipation and has been used as a wash to soothe nervous and irritable babies[257]. The plant is used as a treatment for sore gums[257].

nrakta Western N. America - British Columbia to California. ksacta Coastal cliffs and ledges, or in the gravelly soil of the foothills[60].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made. it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year [K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Alpine garden, Container, Ground cover, Rock garden, Seashore. A very easily grown plant, it succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Tolerates some shade[188]. Established plants are drought tolerant[200]. Succeeds in poor soils and on walls[200]. Hardy to at least -15°c[200]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they are eaten in guantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, North American native.

# 7.2.495 Abies spectabilis

Himalavan Fir

6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 30 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hjonli

drutta Abies spectabilis is an evergreen Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Essential Fuel Incense WoodAn essential oil is obtained from the plant, though the report does not give yields or uses[240]. The dried leaves, mixed with other ingredients, are used in making incense[272]. The wood is used for construction and thatching roofs[272]. It is also used for fuel[272].

dwatta Antiperiodic Astringent Carminative Expectorant Stomachic TonicThe leaves are astringent, carminative, expectorant, stomachic and tonic[240]. The leaf juice used in the treatment of asthma, bronchitis etc[240, 243, 272]. An essential oil obtained from the leaves is used to treat colds, rheumatism and nasal congestion[272]. The leaf juice is antiperiodic[240, 243].

nrakta E. Asia - Himalayas from Afghanistan to Nepal. ksacta Forests in Nepal between 2700 - 3900 metres[243]. Moist open areas[272].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in

on the prairies[270]. It helps stabilize shifting sand. An important food for livestock and for wild grazers such as bison, desert bighorn sheep, elk, mule deer, pronghorns, and iackrabbits.

nrakta Western N. America - British Columbia to Manitoba, south to Texas, California and Mexico, ksacta Sandy prairies and rocky slopes[43]. Generally found in dry, welldrained soils, in association with a range of plants[270].

propta Seed - sow spring in situ[200]. We have had better results from sowing the seed in a greenhouse. Only just cover the seed and it should germinate freely within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer[K]. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early

nwatta New Crop Staple Crop: Balanced carbSucceeds in any moderately fertile moisture retentive soil in full sun[200]. This species is unlikely to tolerate temperatures lower than about -5°c, and so will only be suitable for the milder areas of the country[213]. Currently (1992) being tested for its potential as a perennial cereal for sandy soils in dry regions[183]. This plants roots are often surrounded by a rhizosheath that harbors nitrogen-fixing organisms[270]. These organisms probably contribute to the species' success as a colonizer[270]. Climate: cold to warm temperate. Humidity: arid to humid. Carbon Farming Solutions - Cultivation: new crop (Describes the non-destructive management systems that are used in cultivation) [1-1].

# 8.1.15 Acacia dealbata

Mimosa. Silver wattle

tfo2n 7 tlin 10 cyuc 2 kcak 3 tcan 0 dwat 25 m hkuc htut cyutli hgatkyuctcup hwicli hrasilut hpa7tli flatprik hpa7tmwatli xre7t hionli

drutta Acacia dealbata is an evergreen Tree growing to 25 m (82ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to February. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FlowersEdible Uses: GumFlowers cooked[144]. Rich in pollen, they are often used in fritters. A gum that exudes naturally from the trunk is edible and is used as a substitute for Gum Arabic[46]. It is very soluble in water and viscous[46, 153], but is of low quality[64]. Larger quantities can be obtained by tapping the trunk[64]. Some species produce a gum that is dark and is liable to be astringent and distasteful, but others produce a light gum and this is sweet and pleasant. It can be sucked like candy or soaked in water to make a jelly.[193]. The gum can be warmed when it becomes soft and chewable[193].

tcanta Dye Gum Soil stabilization TanninA yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. The extensive root system of this plant helps to prevent soil erosion[200]. Tannin is obtained from the bark[61, 171]. On a 10% moisture basis, the bark contains 19.1% tannin[223].

nrakta Australia - Victoria, New South Wales, Tasmania. Naturalized in S. Europe[50]. ksacta In many habitats by streams, gullies and alpine ridges[154, 184]. Dry forests[260].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer. after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a sandy loam and a very sunny position sheltered from strong winds[1, 11]. Succeeds in any good garden soil that is lime-free[11]. Plants become chlorotic on limey soils[200]. They grow well in a hot dry position[166]. and are very drought tolerant[245]. Fast growing[88]. Although it prefers a well-drained soil, the plant is tolerant of both drought and wet conditions[260]. Hardy to about -10°c, this species succeeds outdoors in the milder areas of Britain[11, 184], growing well in Cornwall[49, 59]. If it is cut down by frosts it usually resprouts from the base to form a thicket of slender stems[166]. It can be trained and grown against a sunny wall[202]. Plants require hot, sunny summers if they are to ripen their wood fully and flower freely. In Britain they tend to do best when grown in coastal gardens in a sunny, sheltered position that is protected from the wind[11]. This species is closely allied to A. decurrens[11]. Old specimens sucker very freely, often at considerable distances from the parent tree[200]. Plants can be coppiced[134]. A very ornamental tree[1], there are some named varieties[260]. The species is cultivated in S. Europe for ornament, timber and soil stabilization[50]. The flowers are very attractive and are often sold in florists[11, 61]. The violet-like perfume of the flowers can be guite intoxicating on a calm day[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 8.1.16 Bauhinia vahlii

Malu Creeper, Adda Leaf, Pahur Camel's Foot Creeper tfo2n 7 tlin 11 cyuc 2 kcak 4 tcan 3 dwat 20 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Bauhinia vahlii is an evergreen Climber growing to 20 m (65ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. The flowers are pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Seed SeedpodEdible Uses: GumEdible portion: Seeds, Pods, Leaves, Flower. The seeds are eaten raw or fried[ 287, 317, 668 ]. Cooked as a pulse[310]. The tender young pods and leaves are cooked as vegetables. The flower buds are eaten as a vegetable. The seeds are eaten raw, roasted, or dried and fried.

tcanta Basketry Containers Fibre Gum Soil stabilization String Tannin ThatchingOther uses rating: High (4/5). Agroforestry Uses: The plant is considered to be a formidable enemy of trees in India, where it has been known to completely smother the tree into which it has grown for support[ 372 ]. It is of use on rocky or disturbed and bare slopes, where its can guickly clothe the ground and its large leaves protect the soil from erosion[ 146 ]. Other Uses A good quality fibre is obtained from the inner bark. It can be made into very strong ropes 287, 317, 454]. It is used for sewing straw mats with the fresh bark[ 454 ]. It can be cut in all seasons; the outer bark is stripped off and thrown away, the inner coating being used for ropes, as wanted, by being previously soaked in water and twisted when wet[ 454 ]. Before being used, the bark is boiled and beaten with mallets, which renders it soft and pliable for being made into ropes and string for charpoys[ 454 ]. The stems are used for matting, basketry and wickerwork[ 310 ]. The leaves are utilized for thatching and making umbrellas[ 317 ]. The large flat leaves are sewn together and used as plates, cups, rough tablecloths, umbrellas, cloaks, and rain capes [668]. A gum exudes copiously from the tree[ 668 ]. Of little value[ 146 ]. The bark contains up to 17% tannins[ 287, 310 ]. The tannin cannot be extracted easily, but is of very good quality 310 ].

dwatta Aphrodisiac DemulcentThe seeds are tonic and aphrodisiac[ 287 ]. The leaves are demulcent and mucilaginous[ 287 ].

nrakta E. Asia - India, Nepal, Pakistan. ksacta Climax monsoon-deciduous forests at elevations up to 1,500 metres[

first winter. Plant out in late spring or early summer[K]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Pot up and overwinter in a cold frame then plant out in late spring or early summer. Fair to good percentage[78]. Layering in spring[200].

nwatta Landscape Uses:Border, Hedge, Screen, Seashore, Specimen. Prefers a moist soil[200]. Grows well in an open position in a well-drained soil in sun or light shade[200]. Thrives in any ordinary garden soil according to one report[11] whilst another says that it thrives in an acid soil[182]. Prefers a lime-free loamy or peaty soil[1]. Plants can be cut back to the ground in severe winters in many parts of Britain[1, 11], but they are well suited to the milder parts of the country[11, 59] where they are fast-growing and produce fruit within 5 years from seed[K]. They succeed and fruit well on a south facing wall at Kew[K]. Plants in this genus are notably resistant to honey fungus[200]. The fruit is covered with a deposit of wax that has a balsamic odour[245]. Many species in this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features: Attracts birds, North American native, Fragrant foliage, Attracts butterflies, Inconspicuous flowers or

### 8.1.13 Glycine soja

Wild Sova Bean

tfo2n 7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Glycine soja is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

pcista The raw mature seed is toxic and must be thoroughly cooked before being eaten[76]. The sprouted raw seed is sometimes eaten and is considered to be a wholesome food. Avoid prolonged treatment and with asthma and allergic rhinitis patients. Caution with breast cancer patients. Hypoproteinaemia possible in children with cystic fibrosis using soya milk. Women with oestrogen receptor positive tumours using sova protein supplements should excercise caution. Children severely allergic to cow's milk frequently sensitive to soy [301].

kcakta Edible Parts: Leaves Oil Oil Seed SeedpodEdible Uses: Coffee Milk Oil OilMature seed - cooked[2, 33]. Very rich in protein, the seeds can be eaten as they are in soups, stews etc[183], though they are very commonly used in the preparation of various meat substitutes[34, 46]. The dried seed can be ground into a flour and added to cereal flours or used for making noodles etc[183]. The Japanese make a powder from the roasted and ground seed, it is called 'Kinako' and has a nutty flavour and fragrance - it is used in many popular confections[183]. The sprouted seed is eaten raw or added to cooked dishes. The toasted seeds can be eaten as a peanut-like snack[183]. The seed is also made into numerous fermented foods such as miso and tempeh[183] and is also used to make soya milk, used in place of cow's milk. The seed contains 20% oil and 30 - 45% protein[100]. The immature seed is cooked and used like peas or eaten raw in salads[105, 183]. The strongly roasted and ground seeds are used as a coffee substitute [183]. The young seedpods are cooked and used like French beans[116, 183]. An edible oil is obtained from the seed. It is cooked or used as a dressing in salads etc[34, 183]. Young leaves - raw or cooked[179, 183].

tcanta Oil OilThe seed contains up to 20% of an edible semi-drying oil[171]. It is non-drying according to another report[57] This oil has a very wide range of applications and is commonly used in the chemical industry[171, 206]. It is used in making soap, plastics, paints etc[34, 46, 100].

dwatta Antidote Astringent Diaphoretic Laxative Ophthalmic Resolvent StomachicThe fermented seed is weakly diaphoretic and stomachic[176]. It is used in the treatment

of colds, fevers and headaches, insomnia, irritability and a stuffy sensation in the chest[176]. The bruised leaves are applied to snakebite[218]. The flowers are used in the treatment of blindness and opacity of the cornea[218]. The ashes of the stems are applied to granular haemorrhoids or fungus growths on the anus[218]. The immature seedpods are chewed to a pulp and applied to corneal and smallpox ulcers[218]. The seed is antidote[218]. It is considered to be specific for the healthy functioning of bowels, heart, kidney, liver and stomach[218]. The seed sprouts are constructive, laxative and resolvent[218]. They are used in the treatment of oedema, dysuria, chest fullness, decreased perspiration, the initial stages of flu and arthralgia[176]. A decoction of the bark is astringent[240]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Glycine soja Wild Soya Bean for raised blood levels and cholesterol (see [302] for critics of commission E).

nrakta E. Asia - China, ksacta Lowland thickets, C. and S. Japan[58].

propta Pre-soak the seed for 12 hours in warm water and then sow in early spring in a greenhouse. The seed should germinate within two weeks at a temperature between 12 -16°c[206]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring or early summer, after the last expected frosts. Seed can also be pre-soaked for 12 hours in warm water and then sown in situ in late spring, though this will not yield well unless the summer is very hot.

nwatta Requires a rich soil and a sunny position[33, 38]. Prefers a well-drained sandy soil[1]. Prefers a slightly acid soil[200, 206]. Does not grow well in a wet climate[132]. This is the wild ancestor of the cultivated sova bean and is of potential value as a genetic resource, especially when trying to breed for increased yields. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Seed can be purchased that has been treated with this rhizobium, it is unnecessary on soils with a pH below 5.5 but can be helpful on other soils[206]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

#### 8.1.14 Achnatherum hymenoides

Indian Millet, Indian ricegrass

tfo2n 7 tlin 10 cyuc 3 kcak 3 tcan 0 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli drutta Achnatherum hymenoides is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July. The species is hermaphrodite (has both male and fe-

male organs) and is pollinated by Wind. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid. neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong

winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - raw, cooked or ground into a meal and used in making bread etc, gruel and as a thickener in soups. The seeds are ground into a meal for bread and porridge. They can also be used for cakes. They can be mixed with cornmeal and used for dumplings, [2, 46, 85, 106, 183]. The seed is rather small but when fully ripe it falls readily from the plant and is fairly easy to harvest[183]. Another report says that the seed is rather large[183], but this has not been our experience[K]. The seeds were parched over the flames of a fire in order to remove the hairs[213]. A pleasant taste and very nutritious[85, 183], it contains about 6% sugars and 20% starch[213]. Before corn was introduced to the area, this seed was at one time a staple food for some native North American Indian tribes[213] Carbon Farming Solutions - Staple Crop. balanced carb (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta Soil reclamation Soil stabilization StrawSeveral cultivars have been developed for use in restoration work an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils. Plants are very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. This species is unsatisfactory in south-eastern Britain due to damage by late frosts, trees rarely live more than 40 years and have a poor thin crown[185]. Trees grow far better in the milder and moister western side of the country[11]. Young trees are very slow to establish because they are often damaged by late frosts, it is best to grow the young trees in high shade to get them through this time[1, 185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200].

### 7.2.496 Clematis mandschurica

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Clematis mandschurica is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Analgesic Antibacterial Antifungal Dysentery Emmenagogue HypotensiveThe root is analgesic, antibacterial, antidiuretic, antifungal, emmenagogue and hypotensive[279]. It contains several medically active constituents including clematosides, hederagenin and anemonin[279]. It is used in Korea in the treatment of leucorrhoea, dysentery, neuralgia, menostasis and delayed menstruation[279].

nrakta E. Asia - northern China, Japan, Korea, ksacta Shrubberies and open wooded slopes at elevations up to 800

propta Seed - best sown as soon as it is ripe in a cold frame[164, 200]. Sow stored seed as soon as it is obtained in a cold frame. Pre-soak the seed for 12 hours in warm water and remove as much of the tail and outer coat as possible[164]. A period of cold stratification is beneficial[164]. The seed germinates in 1 - 9 months or more at 20°c[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in late spring or early summer, after the last expected frosts. Internodal cuttings of soft to semi-ripe wood, late spring in sandy soil in a frame[200]. Layering of old stems in late winter or early spring[200]. Layering of current seasons growth in early summer[200].

nwatta Prefers a deep moist soil with its roots in the shade[11, 200]. Dislikes poorly-drained heavy clay soils, but grows well in clay if grit is added for drainage[11, 200]. Dislikes light sandy soils[11]. Does well on chalk[1]. Succeeds in acid as well as alkaline soils[200]. This species is closely related to C. terniflora, and is included in that species by some botanists[273]. When planting out, in order to avoid the disease 'clematis wilt', it is best to plant the rootball about 8cm deeper in the soil. This will also serve to build up a good root crown of growth buds[200]. The plant flowers on the current seasn's growth, so any pruning is best carried out in late winter or early spring[273]. A twining plant[182]. The leafstalks wrap themselves around twigs and branches for support. When a side of the stalk touches an object, the growth on that side slows down whilst the other side grows at its normal rate - this causes the leaf stalk to entwine the object. it is touching[212]. Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

#### 7.2.497 Platanus orientalis

Oriental Plane, Oriental planetree 6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 30 m hkuc

htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Platanus orientalis is a deciduous Tree growing to 30 m (98ft) by 30 m (98ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May, and the seeds ripen from October to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista In hot dry climates the hairs of the fruits and leaves are believed to cause an effect similar to hay fever[11,

tcanta Dye WoodA fabric dye is obtained from the branches and roots[7]. The colour is not given[K]. Wood tough, difficult to split, not durable. It is not esteemed for carpentry, but has certain advantages in cabinet making[7], it is also used for inlay work and wood pulp[46, 61, 89].

dwatta Astringent Dysentery Ophthalmic VulneraryThe leaves are astringent and vulnerary [7]. The fresh leaves are bruised and applied to the eyes in the treatment of ophthalmia[240]. A decoction is used to treat dysentery and a cream made from the leaves is used to heal wounds and chilblains[7]. The leaves are harvested in the spring and summer and can be dried for later use[7]. The bark is boiled in vinegar and then used in the treatment of diarrhoea. dysentery, hernias and toothache[240].

nrakta S.E. Europe to W. Asia. ksacta By rivers in forests in the hills[89]

propta Seed - two months cold stratification improves germination[113]. Sow spring in a cold frame in light shade[78, 98]. Home grown seed is often of poor quality and low viability. It is best to harvest the seed in late winter or spring and then sow it immediately in a cold frame[80]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood of the current years growth, 20 - 30 cm with a heel, autumn in a cold frame[1], Easy[200], Lavering of stools in spring or autumn. Takes 12 months[78].

nwatta Requires a sunny position in a deep fertile welldrained soil[188]. A fast growing species, established plants are drought tolerant[200]. Tolerates atmospheric pollution and compacted soils[200]. This species is hardy in most areas of Britain but the trees do not do well in northern parts of the country, requiring hotter summers than are normally experienced there[98]. A very ornamental and very long lived tree[1]. It is immune to 'Plane tree wilt' fungus[11]. Very tolerant of root disturbance, trees up to 5 metres tall can be moved quite easily[200].

# 7.2.498 Asarum maximum

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat m hkuc

pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asarum maximum is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista Although no reports of toxicity have been found for this plant, at least 3 other members of this genus have reports that the leaves are toxic[7, 19]. Some caution is therefore advised in the use of this plant.

dwatta Analgesic ExpectorantThe dried plant is used medicinally in Vietnam[283]. The leaves ate used in the treatment of dyspepsia and colic whilst the flowers and roots are

used as a reconstituent [283]. Analgesic, expectorant. Used as a gargle for sore throats etc[174].

nrakta E. Asia - China in Hubei and E. Sichuan. ksacta Forests in humus rich soils at elevations of 600 - 800 metres[266].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°c[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200].

### 7.2.499 Rhododendron molle

Chinese Azalea

6 tlin 9 cvuc 0 kcak 0 tcan 1 dwat m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hionli

drutta Rhododendron molle is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

pcista The plant is very toxic[147]. The pollen of many if not all species of rhododendrons is also probably toxic, being said to cause intoxication when eaten in large quantities[183].

tcanta InsecticideThe powdered flowers have a mild insecticidal effect[57].

dwatta Anaesthetic Analgesic SedativeThe flowers are analgesic, anaesthetic and sedative[218]. They are applied externally in the treatment of arthritis, caries, itch, maggots and traumatic injuries[218]. The root is used in the treatment of arthritis, rheumatism and traumatic injuries[218].

nrakta E. Asia - China. ksacta Grows amongst coarse grasses and shrubs, also in thin pine woods[11].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood, August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayey[1]. Prefers a peaty or well-drained sandy loam[1]. Succeeds in sun or shade, though it prefers a shady position[1]. A pH between 4.5 and 5.5 is ideal[1]. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. A very ornamental plant[1], it is the parent of many cultivars[11]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.500 Centaurea melitensis

Maltese Star Thistle 6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli drutta Centaurea melitensis is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable PH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

dwatta The plant is used in the treatment of the kidnevs[257].

nrakta Mediterranean region, eastwards to Greece and Tunisia. A not infrequent casual in Britain[17]. ksacta Wasteplaces and roadsides[17].

propta Seed - sow April in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. If you have sufficient seed it can be sown in situ in the spring, and an autumn swing in situ might also be worth trying.

nwatta We do not have information on this species, but the following notes are based on the closely related C. solstitialis. Succeeds in ordinary garden soil[1, 200]. Prefers a well-drained fertile soil and a sunny position[200]. Tolerates dry, low fertility and alkaline soils[200]. A good bee and butterfly plant the flowers are rich in nectar[171]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 7.2.501 Ilex rotunda

Kurogane holly

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 20 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta llex rotunda is an evergreen Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

dwatta DepurativeThe stem bark is detoxicant[218]. The plant is used in a mixture with other herbs for its haemostatic action[218]

nrakta E. Asia - E. China, Japan, Korea. ksacta Evergreen forests[275]. Evergreen broad-leaf forests, forest margins on mountain slopes at elevations of 400 - 1100 metrac/2661

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October, Takes 2 years[78].

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species should be hardy in many ar-

disease. Tannin constituents may cause gastrointestinal irritation and liver damage [301].

kcakta Edible Parts: FruitEdible Uses: Condiment TeaFruit - raw or cooked[105, 177, 183]. The fruit is about 3mm in diameter with a large seed[200]. There is very little edible flesh and the quality is poor[K]. Leaves and berries are used as a food flavouring[62, 105, 177]. They make an aromatic, attractive and agreeable substitute for bay leaves, and can be used in flavouring soups, stews etc[183]. The dried leaves are brewed into a robust tea[183].

tcanta Dye Hedge Hedge Wax WoodA wax covering on the fruit contains palmitic acid and is extracted by scalding the fruit with boiling water and immersing them for a few minutes, the wax floats to the surface and is then skimmed off. The fruit is then boiled in water to extract the wax from the pulp and once more the wax is skimmed off. It is then strained through a muslin cloth and can be used to make aromatic candles, sealing wax etc[1, 4, 6, 11, 62, 95, 171, 245, 274]. Candles made from this wax are quite brittle but are less greasy in warm weather[213]. They are slightly aromatic, with a pleasant balsamic odour[245], and do not smoke when put out, making them much more pleasant to use that wax or tallow candles[213]. The wax is also used in making soaps[213]. About 1 kilo of wax can be obtained from 4 kilos of berries[4]. A blue dye is obtained from the fruit[6]. The plant can be grown as an informal hedge[200], succeeding in windy sites[K]. Wood - light, soft, brittle, finegrained[82, 227]. The wood weighs 35lb per cubic foot[227]. It is of no commercial value[229].

dwatta Antibacterial Astringent Dysentery Emetic Narcotic Sternutatory Stimulant TonicWax myrtle is a popular herbal remedy in North America where it is employed to increase the circulation, stimulate perspiration and keep bacterial infections in check[254]. The plant should not be used during pregnancy[254]. The root bark is antibacterial, astringent, emetic (in large doses), sternutatory, stimulant and tonic[4, 21, 46, 165, 213, 254]. It is harvested in the autumn, thoroughly dried then powdered and kept in a dark place in an airtight container[4]. It is used internally in the treatment of diarrhoea, irritable bowel syndrome, jaundice, fevers, colds, influenza, catarrh, excessive menstruation, vaginal discharge etc[4, 238, 254]. Externally, it is applied to indolent ulcers, sore throats, spongy gums, sores, itching skin conditions, dandruff etc[4, 238, 254]. The wax is astringent and slightly narcotic[4]. It is regarded as a sure cure for dysentery and is also used to treat internal ulcers[4]. A tea made from the leaves is used in the treatment of fevers and externally as a wash for itchy skin[222].

nrakta South-eastern N. America. Possibly naturalized in S. England[50]. ksacta Thickets on sandy soil near swamps and marshes[43], also on dry arid hills in which situation it is often only a few centimetres tall[62].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[78]. Stored seed germinates more freely if given a 3 month cold stratification and then sown in a cold frame[78]. Germination is usually good[78]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for the first winter. Plant out in late spring or early summer[K]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Pot up and overwinter in a cold frame then plant out in late spring or early summer. Fair to good percentage[78]. Layering in spring[200].

nwatta Industrial Crop: Wax Management: Standard Wild-harvested and SoldLandscape Uses:Border. Erosion control, Screen, Seashore, Specimen. Prefers a moist soil[200]. Grows well in an open position in a welldrained soil in sun or light shade[200]. Thrives in any ordinary garden soil according to one report[11] whilst another says that it thrives in an acid soil[182]. Prefers a lime-free loamy or peaty soil[1]. Plants can be evergreen in areas with warmer winters than in Britain[227]. Some reports say that the plant is dioecious whilst others say it is monoecious. It is most likely that both forms exist[82, K]. A polymorphic species[11], there are some named forms. 'Myda' is a large-fruited female form of low growth[182]. The fruit is covered with a deposit of wax that has a balsamic odour[245]. The fruits can hang on the plant for several years[213]. Closely related to M. pensylvanica, with which it hybridizes[43]. Plants in this genus are notably resistant to honey fungus[200]. Many species in this genus have a symbiotic relationship with certain soil micro-organisms, these

form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features: Attracts birds, North American native, Fragrant foliage, Naturalizing, Wetlands plant, Attracts butterflies, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone, 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. An evergreen. The root pattern is stoloniferous rooting from creeping stems above

# 8.1.12 Myrica californica

California Bayberry, California Wax Myrtle, California Barberry

tfo2n 7 tlin 11 cyuc 3 kcak 3 tcan 1 dwat 4 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Myrica californica is an evergreen Shrub growing to 4 m (13ft lin) at a medium rate. See above for USDA hardness. It is hardy to UK zone 7. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista Although no reports of toxicity have been seen for this species, there is a report for some members of this genus that some of the constituents of the wax might be carcinogenic[2221.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 177]. The fruit is about 6mm in diameter with a large seed[200]. There is very little edible flesh and the flavour of this is poor[200, K].

tcanta Dye Wax WoodA wax covering on the fruit is extracted by scalding the fruit with boiling water and immersing them for a few minutes, the wax floats to the surface and is then skimmed off. The fruit is then boiled in water to extract the wax from the pulp and once more the wax is skimmed off. It is then strained through a muslin cloth and can be used to make aromatic candles[106, 245]. Candles made from this wax are quite brittle but are less greasy in warm weather[213]. They are slightly aromatic and do not smoke when put out, making them much more pleasant to use that wax or tallow candles[213]. The wax is also used in making soaps[213]. To date (07/12/95) plants growing on our Cornish trial grounds have fruited freely but have not produced much wax. They produced somewhat more after the hot summer of 1995, but there was still not enough to make extraction worthwhile[K]. A grey-brown and a maroonpurple dye are obtained from the fresh or dried berries[168]. Wood - heavy, very hard, strong, brittle, close grained[82].

dwatta StomachicThe bark and root bark is used in the treatment of gastrointestinal disorders and infections[238].

nrakta South-western N. America - Washington to California. ksacta Ocean sand dunes and moist hill sides near the coast[60], usually on acid soils[1] and tolerating poorly drained soils[229].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[78]. Stored seed germinates more freely if given a 3 month cold stratification and then sown in a cold frame[78]. Germination is usually good[78]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for the

Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the aboveground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

## 8.1.10 Prosopis juliflora

Mesquite, Honey Mesquite tfo2n 7 tlin 12 cyuc 3 kcak 4 tcan 2 dwat 10 m hkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli hjonli

drutta Prosopis juliflora is an evergreen Tree growing to 10 m (32ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. The flowers are pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Plant has spines or sharp edges; use extreme caution when handling

kcakta Edible Parts: Flowers Inner bark Root Seed SeedpodEdible Uses: Drink Gum Sweetener TeaSeedpods raw or cooked[301]. They can be roasted, chewed or ground into a powder[301]. A rich, delicious flour can be made from pulverized pods from which seeds have been removed[303 ]. The powder can be mixed with water to make a refreshing drink, which can be drunk immediately, made into a pudding or allowed to ferment into a sort of beer[301]. Mature seeds can be soaked overnight and then baked like kidney beans[301]. Cotyledons and embryos when pulverized yield a flour rich in protein and sugar appropriate for diabetic people[303]. Flowers - raw. A sweet flavour[301]. They can also be roasted or made into a tea[301]. A sweet gum exudes from the trunk[301]. It is used in making sweets[301 l. The wood is used as a flavouring to smoke foods[301].

tcanta Adhesive Charcoal Dye Fencing Fibre Furniture Gum Miscellany Paper Resin Shelterbelt Soil reclamation Soil stabilization Tannin WoodAgroforestry Uses: Plants can be used for erosion control, to stabilize dunes, in shelterbelts and windbreaks, and as living fences in arid and semi-arid climates[200, 303]. Mesquite is widely planted for land reclamation because it is an aggressive colonizer, tolerant of very poor, degraded, saline and alkaline soils. Aerial seeding of a mixture of P. juliflora, Nicotania glauca and several Eucalyptus species is used to revegetate abandoned copper mines[303]. Other Uses The heartwood contains significant amounts of extractable polyphenolic compounds from which can be isolated a unique flavinol compound used in the formation of new phenol-formaldehyde polymeric resins[303]. A reddish-amber gum, similar in properties to the gum arabic produced by Acacia senegal, often exudes from the stem and older branches[303]. It forms an adhesive mucilage[46] 1 Tannin or dyestuff can be extracted from the wood and bark, but the yield is only about 10%[303]. Tannin could also be extracted as a by-product when the wood is processed for other purposes[303]. There is a large potential for the wood as a source for fibre in the production of paper, paperboard and hardboard[303]. The heartwood is dark brown to red or yellowish; the thin band of sapwood light yellow. The wood is close grained, moderately hard, heavy, tough, strong and durable in the soil, though susceptible to the attacks of drywood termites. Seasoned wood is used for rail ties, fence posts, furniture, crafts and corrals. It is rarely used in construction, as most tree trunks are not long or straight enough[46, 303, 325, 447]. The generally crooked stems and branches make good firewood and provide excellent charcoal[303, 325]. The charcoal is used extensively in the USA as barbecue fuel[303].

dwatta Expectorant Miscellany SkinA syrup prepared from the ground up pods has various medicinal values. It

is given to children showing weight deficiency or retardation in motor development[303]. It is believed to increase lactation[303]. It is also used for preparing various medicinal syrups, particularly for expectorants[303]. A tea made from P. juliflora is thought to be good for digestive disturbances and skin lesions[303].

nrakta Northern and western S. America - Colombia, Ecuador, Venezuela; north through Central America to Mexico. ksacta Light, sandy or gravelly soils in arid or semiarid areas where there is subterranean moisture[200]. Commonly found on over-grazed land[200].

propta Seed - they can be stored for several years at ambient temperatures [325]. The seed has a very hard seedcoat and could take several years to germinate without pretreatment to allow moisture to be absorbed. There are various ways of doing this - carefully making a small nick in the seedcoat, being careful not to damage the seed is very effective on a small scale. On a larger scale, soaking the seed in nearly boiling water for a few minutes (being careful not to cook the seeds) and then for another 24 hours in warm water is a common method[325]. Sow the seed in a sunny position in a nursery seedbed or individual pots. Germination of treated seed is usually fast, with 80 - 90% of the seeds sprouting within 4 - 6 days 303, 325 ]. Aerial seeding is applied successfully to quickly cover remote, extensive and poorly accessible areas[303]. Inoculation with Rhizobium and mycorrhizal fungi is advantageous[303] Root cuttings. Grafting.

nwatta A plant for the drier areas of the tropics and subtropics, succeeding from sea level up to elevations of 1,500 metres[303]. It can be grown in areas where the mean annual temperature ranges from 14 - 34°c, with an absolute maximum of almost 50°c; and where the annual precipitation is as low as 50mm or up to 1,200mm[303, 325]. Adapted to many soil types from acid to alkaline and including strongly saline and severely depleted soils[303]. Requires a position in full sun in a light, well-drained soil[200]. Plants have very long taproots and, once established, are extremely drought resistant[200]. They can also tolerate seasonal waterlogging[303]. Mesquite is sometimes said to dry out the soil and compete with grasses, particularly in dry areas[303 ]. Plants can begin flowering when 3 - 4 years old, often flowering twice a year and producing seed prolifically [303]. Hence in some areas, especially the more humid ones, it can spread freely and is considered a weed[303]. A fast-growing species[381]. The plant coppices readily[303]. The plant produces fragrant, nectar-rich flowers from which bees produce a fine-flavoured clear honey[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby [755]. Total nitrogen, sulphur and soluble salts, as well as organic matter, have been shown to increase 3-fold in the upper 4.5 metres of soil under P. Juliflora[303]. Flowering Time: Mid Summer Late Summer/Early Fall. Bloom Color: Pale Yellow.

#### 8.1.11 Myrica cerifera

Wax Myrtle - Bayberry Wild Cinnamon, Southern Bayberry, Wax Myrtle, Southern Wax Myrtle tfo2n 7 tlin 11 cvuc 3 kcak 4 tcan 3 dwat 9 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Myrica cerifera is an evergreen Shrub growing to 9 m (29ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from April to June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime

poista There is a report that some of the constituents of the wax are carcinogenic[222]. Vomiting in large doses. Constituent myricadiol may cause salt retention and potassium excretion [301]. Avoid if high blood pressure or kidney

end of its range in Japan are obtained[11]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

# 7.2.502 Pterocarva stenoptera

Chinese wingnut

6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 20 m hkuc htut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Pterocarya stenoptera is a deciduous Tree growing to 20 m (65ft) by 15 m (49ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in June, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

tcanta InsecticideThe leaves have insecticidal properties[218].

dwatta Anthelmintic Astringent Eczema Febrifuge Skin StomachicAnthelmintic, astringent, febrifuge, stomachic[61, 178]. The leaves are used in the treatment of abscesses, eczema and scabies[218]. The stem bark is anthelmintic and carminative[218].

nrakta E. Asia - China. ksacta Mixed deciduous forests on mountain slopes or riverbanks, often forming pure stands in small patches in the openings of deciduous oak forests, from sea level to 1500 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[80, 113]. Pre-soak stored seed for 24 hours in warm water[80] then cold stratify for 2 - 3 months[98, 113]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer of the following year[240]. Cuttings of halfripe wood, July/August in a frame[113]. Cuttings of mature shoots, November in a frame. Only use vigorous shoots[113]. Layering. Division of suckers in the dormant season[188].

nwatta Prefers a sunny position in a rich strong loam with abundant moisture at the roots[11, 200]. Succeeds in areas that do not experience prolonged winter temperatures below about -12°c[200], but young plants and the young shoots of older trees can be cut back by winter frosts[11]. Plants are tolerant of compacted soils[200]. The leaves are resinous to the touch and emit a resinous aroma[245]. The root system of this tree is too invasive for small gardens[200]. Plants in this genus are notably resistant to honey fungus[200].

## 7.2.503 Cunninghamia lanceolata

6 tlin 9 cvuc 0 kcak 4 tcan 2 dwat 15 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Cunninghamia lanceolata is an evergreen Tree growing to 15 m (49ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to May, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil.

pcista Plant has spines or sharp edges; use extreme caution when handling

tcanta Charcoal Miscellany WoodAgroforestry Uses: The tree is suitable for reforestation schemes in subtropical evergreen, coniferous and mixed broad-leaved forests 303 , 329 ]. It is a suitable species for agroforestry systems in

eas of Britain, especially if provenances from the northern China as it is usually intercropped with a number of crops such as maize, beans, wheat, Chinese sorghum, buckwheat, potato, 'ground chestnut' (Arachis hypogaea), tobacco and upland rice; or with other tree species such as the tung oil tree (Aleurites fordii), tea and Litsea cubeba. The interplanting is important not only to increase the income of farmers during early stages of plantations but also to avoid the land degradation that results from continuous cropping of this tree[ 303 ]. Other Uses The bark is a source of tannins[ 303 ]. The branches produce an essential oil that is used in the perfume industry. Cedrol, pinene, phellandrene, citrene, terpinol, thujenol, cadinol and borneol are the main constituents of the oil[ 303 ]. The pale vellow to white, fragrant wood is uniform-textured; straight-grained; light in weight; and durable, though it rots easily if it is continually wet. It is easily worked and resists insect and termite damage. It is used in construction, ship building etc wherever great strength is required. Older and larger branches are used in turnery 1, 46, 61, 178, 303]. A good quality fuel and a charcoal can be made from the wood[ 178, 303].

> dwatta Antidote Carminative Miscellany SkinCarminative. A decoction of the wood is used internally in the treatment of varnish poisoning (from species of Rhus), chronic ulcers, hernia etc[ 178, 218, 303]. The decoction of the wood is used as a bath for smelly feet[ 303 ]. An essential oil from the plant is used to treat bruises, pain, rheumatism and wounds 218, 303. The ash of the bark is used to treat burns, scalds and wounds 218, 303, A decoction of the cone is used in the treatment of coughs[ 218, 303 ].

> nrakta E. Asia - China. ksacta Mixed broad-leaved forests, rocky hillsides and roadsides, 200 - 2800 metres in most temperate areas of China[266]. Often forming small, pure stands on red sandstone soils[109].

> propta Seed - they have no dormancy and pre-treatment is not necessary. Germination can be improved by soaking the seeds in warm water for a few hours prior to sowing 325 l. Seeds are sown in seed beds, germination begins after 7 days and is terminated after 20 days[ 325 ]. As soon as they are large enough to handle, the seedlings are pricked out into polytubes. Seedlings are normally ready for transplanting into the field in 4 - 5 months later, when they are 35 - 40cm tall[ 325 ]. Vegetative propagation of this species is relatively easy, and at one time most planting stock was produced from coppices from basal stumps after felling 325 Nursery seedlings, however, have faster early growth and better survival than coppice sprouts. Since the 1980s, techniques have been developed to produce planting stock from root cuttings[ 325 ]. The cuttings are collected from the root collar when they reach a height of about 10 cm and placed in rooting beds. These cuttings have a survival rate of 90 -95% and the quality is similar to that of seedling stocks 325 ]. Cuttings from lateral shoots are not suitable [ 325 ].

> nwatta Landscape Uses:Pest tolerant, Specimen. A plant mainly of the warm temperate to subtropical zones, just entering into the tropics. It is found at elevations from near sea level to 2,600 metres[ 325 ]. It grows best in areas where the mean annual temperature is in the range 16 - 19°c and is fairly frost resistant - mature plants can tolerate temperatures down to about -15°c[ 418 ]. It prefers a mean annual rainfall in the range 900 - 2.350mm[ 325 ]. Reguires a rich warm soil and a sheltered sunny position[1]. 164 ]. Best growth is obtained on well-drained loamy soils[ 325 ]. Prefers a pH in the range 5.5 - 6.5, tolerating 5 - 7.5[ 325 ]. Dislikes soil with free lime otherwise the pH is unimportant[ 200 ]. Young trees can make guite rapid growth in height, up to 60cm a year once they have attained more than 1 metre in height 185 ]. Before reaching the height of 1 metre, however, they are liable to be killed by frost[ 185 ]. Trees commence coning and producing viable seeds when they are around 6 - 8 years old[ 303 , 325 ]. This is the main re-forestation tree in China[ 46 , 61 ]. The most important fast-growing timber tree of the warm regions south of the Chang Jiang valley of China[ 266 ]. Unlike most conifers, this species can be coppiedd, and it also resprouts from the roots if cut down[ 1, 303 ]. The bruised foliage emits a delicious resinous aroma[ 245 ]. This species is notably resistant to honey fungus 200 ]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

# 7.2.504 Schizophragma integrifolium

6tlin 9 cyuc 0 kcak 0 tcan 2 dwat 12 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Schizophragma integrifolium is a deciduous Climber growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Plants can be allowed to sprawl and are then used as a ground cover for a shady position[208].

dwatta Carminative RefrigerantThe root and the climbing stem are carminative and refrigerant[147, 218]. Activates blood circulation, strengthens muscles and bones [147].

nrakta E. Asia - C. and W. China. ksacta Rocky cliffs[11], sparse hillside forests and forest edges[147]. Dense to sparse forests in valleys or on mountain slopes or summits at elevations of 200 - 2000 metres[266].

propta Seed - sow late winter to early spring in a greenhouse. Germination is usually fair to very good[78]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in light shade in the greenhouse for their first winter, planting them out in late spring or early summer. Layering in spring directly into pots. A fair to good percentage[78]. Cuttings of half-ripe wood, 4 - 5cm with a heel, July in a frame[1, 78]. Keep the cuttings moist[78].

nwatta Requires a moist leafy soil and some shade at the roots. An easily grown plant[1], it prefers a good loamy soil and plenty of moisture[11] but is not fussy[219]. Plants succeed in sun or shade[182], they flower better in a sunny position but will also succeed on a north-facing wall[188, 219]. In the hotter parts of Britain they prefer shade from the midday sun[219]. Tolerating temperatures down to about -10 to -15°c, this species is not reliably hardy in the coldest parts of the country[219]. Plants do not normally require pruning, though any unwanted growth can be removed in the winter[219]. Plants have a similar growth habit to ivy (Hedera helix) climbing trees by means of aerial roots or growing along the woodland floor[1, 182]. Plants might need some help to become attached in their early years[182].

# 7.2.505 Liquidambar formosana

Formosan Gum, Chinese Sweet Gum, Formosa Sweet Gum 6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Liquidambar formosana is a deciduous Tree growing to 12 m (39ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower in May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Resin WoodAn aromatic resin is obtained from the trunk of this tree[4]. It forms in cavities of the bark and is harvested in autumn. It is used medicinally[178]. Wood. Used to make tea chests for higher grade teas[1, 46, 61].

dwatta Anodyne Antiphlogistic Antirheumatic Astringent Balsamic Cancer Haemostatic Odontalgic SkinThe leaves are used in the treatment of cancerous growths[218]. The stem is anodyne, antiphlogistic, astringent, balsamic and haemostatic[178, 218]. The resin from the stems is mixed with Rhammus crenata fruits and used as a suppository for constipation[218]. The stem bark is used in the treatment of fluxes and skin diseases[218]. The fruits are antirheumatic, diuretic and galactogogue[176]. They are used in the treatment of arthritis, lumbago, oedema, oliguria, decreased milk production and skin diseases[176, 218]. The root is used in the treatment of cancerous growths[218]. The resin from the

stems is used to treat bleeding boils, carbuncles, toothache and tuberculosis[218].

nrakta E. Asia - Central and southern China from Taiwan to south-west Sichuan. ksacta A very wide range, especially in the warm temperate zones, growing in woodland and in open country[109]. Moist forests at elevations to 2500 metres in the south of its range[260].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Harvest the seed capsules at the end of October or November, dry in a warm place and extract the seed by shaking the capsule. Stored seed requires 1 - 3 months stratification and sometimes takes 2 years to germinate. Sow it as early in the year as possible. Germination rates are often poor. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse for their first winter. Since they resent root disturbance, it is best to plant them out into their permanent positions in early summer of their second year and give them some protection from cold for their first winter outdoors[K]. Cuttings of half-ripe wood, July/August in a frame. Suckers in early spring. Layering in October/November. Takes 12 months.

nwatta Landscape Uses:Aggressive surface roots possible, Specimen. Prefers a moist but not swampy loam in a sunny sheltered position[1, 200]. Succeeds in light shade[188]. Requires a deep fertile soil[200]. Prefers a neutral to acid soil, growing poorly on shallow soils overlying chalk[188]. Not all introductions of this species are hardy[11]. The Monticola group, which comes from western Hubei and north-eastern Sichuan, tolerates temperatures lower than -5°(200, 260]. Young plants are susceptible to frost damage and should be protected for their first few years[200]. This species resents root disturbance, young plants should be pot-grown and be placed in their permanent positions as soon as possible[200]. Special Features: Attractive foliage, Not North American native, Inconstituous flowers or blooms.

## 7.2.506 Ampelopsis japonica

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Ampelopsis japonica is a deciduous Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August, and the seeds ripen from September to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist, soil.

dwatta Anodyne Antibacterial Antifungal Depurative Febrifuge VulneraryThe roots are anodyne, antibacterial, anticonvulsive, antifungal, bitter, cooling, depurative, expectorant, febrifuge and vulnerary[147, 176, 218]. A decoction of the roots is used in the treatment of tuberculous cervical nodes, bleeding from haemorrhoids and burn injuries[147].

nrakta E. Asia - China, Japan, Korea ksacta Mountain sides[147]. Usually climbing into trees and shrubs on hillsides and thickets, also found on grasslands, at elevations of 100 - 900 metres[266].

propta Seed - sow in pots in a cold frame in the autumn or stratify for 6 weeks at 5°c and sow in the spring[200]. Germination can be quite slow, sometimes taking more than a vear. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. When they are more than 20cm tall, they can be planted out into their permanent positions, preferably in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long, July/August in a frame[78]. Cuttings or eyes in late autumn or winter. Either place them in the ground in a greenhouse or cold frame, or put them in pots. An eve cutting is where you have just one bud at the top and a short length of stem with a small part of the bark removed. These normally root well and grow away vigorously, being ready to plant into their permanent positions the following autumn. Layering into pots in late summer. Partially sever the stem in spring and then lift the new plants in the autumn[78].

as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

nrakta E. Asia - China, Japan. ksacta Thickets in hills[58,

propta Seed - best sown as soon as it is ripe in a cold frame[78]. It should germinate freely within 4 weeks, though it may take 18 months[K]. Stored seed can be very slow to germinate, often taking more than 18 months. A warm stratification for 4 weeks followed by 12 weeks cold stratification can help[98]. The seed usually (eventually) germinates quite well[78]. Prick out the seedlings into individual pot as soon as they are large enough to handle and plant out when they are at least 15cm tall. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Good percentage[78]. It is best to take the cuttings in June[202]. Cuttings of mature wood of the current year's growth, 10 - 12cm with a heel, November in a frame. Leave for 12 months. Fair to good percentage[78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils that are welldrained[200]. Prefers a soil that is only moderately fertile, succeeding in poor soils and dry soils[11, 200]. Requires a lime-free soil[219]. A very shade tolerant plant, it can be grown under other trees and will eventually climb up into them[29, 166]. Plants are not reliably hardy in the colder areas of the country[200]. This species has some potential as a commercial crop in temperate areas. It does not always carry a good crop, and research needs to be carried out to find the reasons for it, but the fruit is of a reasonable size and, when fully ripe, of a reasonable flavour[K]. It seems to be the latest to ripen in spring of the evergreen Elaeagnus[K]. Closely related to E. pungens, differing in its unarmed branches and thinner more glossy leaves[200]. This species is notably resistant to honey fungus[88, 200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. An excellent companion plant, when grown in orchards it can increase yields from the fruit trees by up to 10%. The small flowers are deliciously scented, their aroma pervading the garden on calm days[K].

# 8.1.9 Glycyrrhiza glabra

Liquorice, Cultivated licorice tfo2n 7 tlin 10 cyuc 4 kcak 4 tcan 4 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hoa7tmwatli xre7t hionli

drutta Glycyrrhiza glabra is a PERENNIAL growing to 1.2 m (4ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista A gross overdose of the root can cause oedema, high blood pressure and congestive heart failure[9, 65]. Do not use during premenstrual syndrome as water retention and bloating occur. If pregnant or have liver cirrhosis use with caution. Avoid using for more than 6 weeks. Excessive quantities may cause headache, sluggishness and potassium depletion [301].

kcakta Edible Parts: RootEdible Uses: Sweetener Tea-Root - raw or used as a flavouring. The source of liquorice powder that is extracted and used in sweets, baked goods, ice cream, soft drinks etc[7, 34, 100, 183], it is also used medicinally. A sweet and delicious flavour, but the root is very fibrous[K]. The root contains glycyrrhizin, a substance that is 50 times sweeter than sucrose[171, 183, 238]. The dried root is often used for chewing, it is excellent for teething children and also as a tooth cleaner[7, 34]. A tea made from the roots is an excellent thirst quencher[21]. The powdered root is also used as a sweetener in other herb teas[183]. The leaves are used as a tea substitute in Mongolia[183].

tcanta Fibre MiscellanyThe plant yields a substance that is used for etching steel sections in photomicrographic

work[171]. Extracts from the root are used as a foaming agent in beers and fire extinguishers[238]. A fibre obtained from the roots is used for insulation, wallboard, boxboard etc[4, 171]. The fibres can be used after the medicinal and flavouring constituents of the root have been removed[4]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Alterative Antiinflammatory Antispasmodic Demulcent Diuretic Eczema Emollient Expectorant Laxative Miscellany Pectoral Tonic UrinaryLiquorice his one of the most commonly used herbs in Western herbal medicine and has a very long history of use, both as a medicine and also as a flavouring to disguise the unpleasant flavour of other medications[4]. It is a very sweet, moist, soothing herb that detoxifies and protects the liver[238] and is also powerfully anti-inflammatory, being used in conditions as varied as arthritis and mouth ulcers[254]. The root is alterative, antispasmodic, demulcent, diuretic, emollient, expectorant, laxative, moderately pectoral and tonic[4, 9, 21, 46, 165, 178]. The root has also been shown to have a hormonal effect similar to the ovarian hormone[7]. Liquorice root is much used in cough medicines and also in the treatment of catarrhal infections of the urinary tract[4]. It is taken internally in the treatment of Addison's disease, asthma, bronchitis, coughs, peptic ulcer, arthritis, allergic complaints and following steroidal therapy[238]. It should be used in moderation and should not be prescribed for pregnant women or people with high blood pressure, kidney disease or taking digoxin-based medication[238]. Prolonged usage raises the blood pressure and causes water retention[7, 238]. See also the notes above on toxicity. Externally, the root is used in the treatment of herpes, eczema and shingles[238]. The root is harvested in the autumn when 3 - 4 years old and is dried for later use[4, 238]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Glycyrrhiza glabra for coughs/bronchitis, gastritis (see [302] for critics of commission E).

nrakta Europe - Mediterranean. ksacta Dry open places[50], especially in sandy places near the sea[132].

propta Pre-soak the seed for 24 hours in warm water and then sow spring or autumn in a greenhouse[200]. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in a greenhouse. Plant out in late spring or early summer when in active growth. Plants are rather slow to grow from seed[238]. Division of the root in spring or autumn. Each division must have at least one growth bud. Autumn divisions can either be replanted immediately or stored in clamps until the spring and then be planted out[200]. It is best to pt up the smaller divisions and grow them on in a cold frame until they are established before planting them out in the spring or summer.

nwatta Requires a deep well cultivated fertile moistureretentive soil for good root production[200]. Prefers a sandy soil with abundant moisture and does not flourish in clay[4] Slightly alkaline conditions produce the best plants[238]. The plant thrives in a maritime climate[7]. Plants are hardy to about -15°c[200]. Liquorice is often cultivated for its edible root which is widely used in medicine and as a flavouring. There are some named varieties[183]. The ssp. glandulifera grows in Russia and produces adventitious roots up to 10 cm thick[142]. Yields of 10 - 12 tonnes per hectare were considered good in the early 20th century, this only being attained in the fourth year of growth[4]. Unless seed is required, the plant is usually prevented from flowering so that it puts more energy into producing good quality roots[238]. The bruised root has a characteristic sweet pungent smell[245]. Plants are slow to settle in and do not produce much growth in their first two years after being moved[4]. The young growth is also very susceptible to damage by slugs and so the plant will require some protection for its first few years[K]. A fairly deep-rooting plant, the roots are up to 120cm long[4]. It can be difficult to eradicate once it is established[238]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plant is heat tolerant in zones 12 through 10. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant

it can be difficult to eradicate once it is established[238]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 8.1.7 Arachis hypogaea

Peanut

tfo2n 7 tlin 10 cyuc 4 kcak 4 tcan 2 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Arachis hypogaea is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers moist soil.

pcista Of greatest concern is possible contamination of damaged or spoiled seeds with the teratogenic, carcinogenic aflatoxins. Two principal toxins, aflatoxins B, and G, and their less toxic dihydro derivatives, aflatoxins B2 and G2 are formed by the aflatoxin producing moulds (Aspergillus flavus et al). Prevention of mould growth is the mainstay, there being no satisfactory way to remove the toxins from feed and foods (however, peanut oils are free of aflatoxins because of alkaline processing)[269]. Avoid if any suggestion of allergy.

kcakta Edible Parts: Leaves Oil Oil Seed SeedpodEdible Uses: Coffee Oil OilSeed - raw, cooked or ground into a powder. Peanuts are a staple food in many tropical zones and are widely exported to temperate area of the world. The seeds have a delicious nutty flavour and can be eaten on their own either raw or roasted[K]. The seeds are commonly ground up and used as peanut butter in sandwiches etc[269]. They can also be cooked in a variety of dishes and are also ground into a powder when they can be used with cereals to greatly improve the protein content of breads, cakes etc[K]. The seed is very rich in protein and oil, it is also a good source of minerals and vitamins, especially the B complex[200]. A nutritional analysis is available [218]. A non-drying edible oil is obtained from the seed[200]. This is one of the most commonly used edible oils is the world. It is similar in composition to olive oil and is often used in cooking, making margarines, salad oils etc[200]. The oilseed cake is said to be a good source of arginine and glutamic acid, used in treating mental deficiencies[269]. The roasted seed makes an excellent coffee substitute[7, 269]. Young pods may be consumed as a vegetable[269]. Young leaves and tips are suitable as a cooked green vegetable[269]. Javanese use the tips for lablab, and germinating seeds to make toge[269].

tcanta Biomass Oil OilThe seeds yield a non-drying oil that has a wide range of uses including the manufacture of pharmaceuticals, soaps, cold creams, pomades and lubricants, paints, emulsions for insect control, and fuel for diesel engines[268, 269]. Peanut hulls are used for furfural, fuel, as a filler for fertilizers or for sweeping compounds[269].

dwatta Antiseborrheic Aperient Demulcent Emollient PectoralThe oil from the seed is aperient, demulcent, emollient and pectoral[218]. The seed is used mainly as a nutritive food[268]. The seeds have been used in folk medicine as an anti-inflammatory, aphrodisiac and decoagulant[269]. Peanuts play a small role in various folk pharmacopoeias. In China the nuts are considered demulcent, pectoral, and peptic; the oil aperient and emollient, taken internally in milk for treating gonorrhoea, externally for treating rheumatism[269]. In Zimbabwe the peanut is used in folk remedies for plantar warts. Haemostatic and vasoconstrictor activity are reported. The alcoholic extract is said to affect isolated smooth muscles and frog hearts like acetylcholine. The alcoholic lipoid fraction of the seed is said to prevent haemophiliac tendencies and for the treatment of some blood disorders (mucorrhagia and arthritic haemorrhages) in haemophilia[269].

nrakta S. America. ksacta Not known in a truly wild

propta Seed - pre-soak for 12 hours in warm water and sow the seed in mid spring in a warm greenhouse. Germination should take place within 2 weeks. When large enough to handle, prick the seedlings out into individual pots of fairly rich soil and grow them on fast, planting them out after the last expected frosts and giving them some protection (such as a cloche) until they have settled down and are growing well.

nwatta Prefers a light humus-rich well-drained soil in a warm sunny sheltered position, though it will tolerate heavier soils[200, 269]. Plants prefer hot dry conditions when the crop is ripening[200]. Peanuts are guite tolerant of acid soils, and aluminium, requiring a minimum of lime for acceptable yields[269]. Tolerates a pH in the range 4.3 to 8.7[269]. Plants are not frost-hardy and most cultivars require too long a growing season to make them a viable crop in Britain. Some cultivars, however (listed below), have a shorter growing season and are worthy of more research in this country[K]. The peanut is widely cultivated in the tropics and sub-tropics for its edible seed and oil contained in the seed, there are many named varieties[200]. It grows best between latitudes 40° south and 40° north[200]. Yields average about 1 tonne of unshelled nuts per hectare, about 80% of this weight is edible seeds (erect forms) and 60 - 75% (running forms)[200]. Crops can be grown at further distances from the equator but vields are likely to be poor[200]. There are three main groups of cultivars:- 'Virginia' has large seeds, 'Valencia' has four seeds per pod and 'Spanish' has the smallest seeds[200]. There are running and erect forms in each group[200]. The erect forms mature more quickly and are therefore more likely to succeed in colder areas[200]. 'Early Spanish' matures in 105 days and has cropped reliably as far north as Canada[183]. 'Spanish' matures in 110 days and crops in Canada if grown in a light sandy soil with southern exposure[183]. Plants are, in general, self-pollinating, though occasional outcrossing by bees occurs[269]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their

#### 8.1.8 Elaeagnus glabra

Soat nipple

tfo2n 7 tlin 10 cyuc 4 kcak 3 tcan 2 dwat 6 m hkuc pcimhmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Elaeagnus glabra is an evergreen Shrub growing to 6 m (19ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from October to November, and the seeds ripen in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[105, 177]. The fruit must be fully ripe before it can be enjoyed raw, if even slightly under-ripe it will be quite astringent[K]. The oval fruit is about 15mm long[200] and contains a single large seed[K]. Seed - raw or cooked. It can be eaten with the fruit though the seed case is rather fibrous[K].

tcanta Hedge HedgePlants can be grown as a hedge in exposed positions, tolerating maritime exposure[29, 166]. They form a good wind-break, though they are somewhat slow to reach an effective size[K]. They succeed when planted under trees that have become bare at the base, in time they will scramble up into the tree and fill out the bottom[29].

dwatta CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated

nwatta Prefers a deep rich loam in a warm sheltered position in sun or semi-shade[11, 200]. Requires plenty of root room[11]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants rarely produce fruit in Britain except after a long hot sum-ner[200]. Plants are occasionally cultivated in Japan for medicinal purposes[58]. The shoots have sticky pads and are self-supporting on walls[11]. Another report says that plants climb by means of coiling tendrils but large plants often need tying in to support the weight of foliage[200].

# 7.2.507 Cotoneaster frigidus

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 10 m hkuc pcimhmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Cotoneaster frigidus is a deciduous Shrub growing to 10 m (32ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in June, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies, midges. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

tcanta Basketry Dye Hedge HedgeA rose-tan dye is obtained from the fruit[168]. The branches are used in basketry and for making twig bridges in the Himalayas[145]. Can be grown as an informal hedge[200].

dwatta Blood tonicThe fruits are eaten to replenish the blood in cases of deficiency[272].

nrakta E. Asia - Himalayas. ksacta Shrubberies and riversides, especially in Nepal, 2200 - 3400 metres from Uttar Pradesh to S.W. China[51]. River valleys, broad-leaved deciduous forests on slopes, 2800 - 3300 metres in Tibetl2661.

propta Seed. Members of this genus hybridize freely so, if you require seed that breeds true, it is important to obtain it from a known wild source or from a controlled fertilization of garden plants. The seed is best sown as soon as it is ripe in the autumn in a cold frame, when it will usually germinate in the spring[11, 200]. Stored seed germinates faster if given 3 months warm stratification at  $15^\circ c$  and then 3 months cold stratification at  $4^\circ c [164]$ . The seed usually germinates within 1 - 18 months at  $15^\circ c$  but it can take 2 years[164]. Pot the seedlings up as soon as they are large enough to handle and plant them out into nursery beds or into their permanent positions when they are more than  $10 \mathrm{cm}$  tall. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200].

nwatta An easily grown plant, it prefers a good soil but also does well in poor soils[1, 11, 200]. It thrives in lime and is also happy in peaty soils[1]. It succeeds in any soil that is not marshy or waterlogged[11, 200]. Succeeds in dry soils[188]. Grows well in heavy clay soils. Succeeds in full sun or semi-shade but does not fruit so freely in a shady position[11, 200]. Plants also succeed in quite deep shade[219]. Tolerates atmospheric pollution[200]. A fast-growing plant[219]. The flowers, when inhaled near to, have an unpleasant smell like decaying fish[245]. They are very attractive to bees whilst the fruit is a good winter food source for many species of birds[200]. Hybridizes freely with other members of this genus, especially those species in the 'Salicifolia' group of this genus[182]. Trees are notably susceptible to honey fungus[200].

# 7.2.508 Campsis grandiflora

Trumpet Creeper 6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 9 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Campsis grandiflora is a deciduous Climber growing to 9 m (29ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in

leaf from June to October, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

tcanta Plants can be allowed to scramble on the ground and will form an effective ground cover, rooting at intervals along the branches[208]. They should be planted about 2.5 metres apart each way[208].

dwatta Blood tonic Carminative Diuretic Febrifuge Women's complaintsThe flowers and the whole plant are blood tonic, carminative, depurative diuretic and febrifuge[147, 178, 218]. They are used in the treatment of women's complaints[147, 178]. A decoction of the flowers is used to correct menstrual disorders, rheumatoid pains, traumatic injuries, difficult urination, pruritis and oozing dermaphytoses[147, 218].

nrakta E. Asia - C. China, Japan. ksacta Hillsides and roadsides in China[147]. Climbs into trees and grows on rocks[260].

propta Seed - sow spring in a greenhouse at 10°c. Two months stratification at 5°c assists germination[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost ripe wood, 7 - 10cm long, July/August in a frame. Slow to root but a fair percentage[78, 200]. Root cuttings 5cm long in December. Fair to good percentage[78]. Division of suckers in the dormant season[202]. Lavering in winter[188]. Plants often self-layer[260].

nwatta Succeeds in a good well-drained loam[11, 200] and a very sunny position[166] or light shade[200]. Toterates moderately alkaline or moderately acid soils[202]. Dormant plants are hardy to about -10°c[200], though they require a sunny sheltered wall or hot summers if they are to flower well[11, 166]. The fresh young growth in spring is often damaged by late frosts[208]. Plants can take some years to settle down before they start to flower[202]. They climb by means of aerial roots but need to be supported[11, 166]. Another report says that this species does not produce aerial roots[219]. Plants can be pruned like grapes (Vitis spp.)[11] and any pruning is best done in the spring[188]. The subspecies C. grandiflora thunbergii tolerates saline winds[200]. Hybridizes freely with other members of this genus[200].

# 7.2.509 Photinia serratifolia

Taiwanese photinia , Chinese Photinia 6 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Photinia serratifolia is an evergreen Shrub growing to 8 m (26ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta WoodThe wood is hard and heavy, suitable for making furniture and other small articles[266].

dwatta Anodyne Aphrodisiac Diuretic Febrifuge Stimulant TonicThe leaves are diuretic, febrifuge, stimulant and tonic[218]. A tincture of the wood is ingested as a tonic and anodyne[218]. The plant is said to have excessive aphrodisiac properties[218].

nrakta E. Asia - China. ksacta Mixed forests, roadsides, slopes, fields, low mountain regions and sea shores from sea level to 2500 metres[266].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn. Stored seed will probably require stratification and should be sown as early in the year as possible[78]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first

winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in a frame[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[11, 78]. They take about 2 months to root and should be overwintered in a greenhouse, planting out in late spring[78]. Fair to good percentage[78]. Cuttings of almost ripe side shoots, 7 - 12cm with a heel. October/November in a cold frame[78]. Lift the following autumn and plant in their permanent positions[78]. Layering in autumn. Partially sever the layer about 12 months later and lift in the following spring. High percentage[200].

nwatta Landscape Uses:Pest tolerant, Screen, Standard, Specimen, Street tree, Requires a well-drained fertile soil in a sheltered position in sun or light shade[1, 200]. Prefers a warm soil that is not too heavy or close[11]. Tolerates calcareous soils[11, 200]. Dislikes windy sites[11]. Plants are hardy to between -7 and -12°c[200]. Hardy at Kew Gardens in all but exceptionally cold winters, this species is at its best in the milder areas of the country where specimens up to 15 metres tall exist[11]. There are some named forms, selected for their ornamental value [200]. The flowers have a delicate scent[245]. Plants are susceptible to fireblight[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Blooms are very showy.

# 7.2.510 Paliurus ramosissimus

Ma Iia Zi

6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hna7tmwatli xre7t hionli

drutta Paliurus ramosissimus is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

tcanta Hair Hedge Hedge WoodThe plants are used as a hedge in China[109]. The ashes of twigs are mixed with oil for a hairwash[178]. The hard timber can use for producing farm tools[266].

dwatta Diuretic Tonic VulneraryThe leaves are applied as a poultice to ulcers and abscesses[178, 218]. The fruit is cooling and diuretic[178, 218]. The root is used in the treatment of sore throats, swellings and internal injuries[218]. The thorny branches and flowers are used in the treatment of thoracic congestion, abscesses and swellings[218]. The spines are said to benefit the uro-genital system and to increase virility in married men[178, 218]. The flowers are applied to running sores[178, 218].

nrakta E. Asia - S. China. ksacta Roadsides and riverbanks in W. Hupeh and Szechwan[109].

propta Seed - best sown as soon as it is ripe in a cold frame and moved into the greenhouse in February. Fair to good germination[78]. Prick out the seedlings into individual pots when they are large enough to handle and overwinter them in the greenhouse for their first year. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings 4cm long, December in a greenhouse. Fair to good percentage[78]. Layering

nwatta Succeeds in an ordinary garden soil in full sun[200]. Prefers a limy soil[200]. Plants in this genus are notably resistant to honey fungus[200].

#### **7.2.511 Eucalyptus** pauciflora niphophila

Snow Gum 6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 6 m hkuc htut cyutli hqatkyuctcuphja7n hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eucalyptus pauciflora niphophila is an evergreen Tree growing to 6 m (19ft) by 3.5 m (11ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

pcista Citronellal, an essential oil found in most Eucalyptus species is reported to be mutagenic when used in isolation[269]. In large doses, oil of eucalyptus, like so many essential oils has caused fatalities from intestinal irritation[269]. Death is reported from ingestion of 4 - 24 ml of essential oils, but recoveries are also reported for the same amount[269]. Symptoms include gastroenteric burning and irritation, nausea, vomiting, diarrhoea, oxygen deficiency, weakness, dizziness, stupor, difficult respiration, delirium, paralysis, convulsions, and death, usually due to respiratory

tcanta Essential Fuel ShelterbeltThe leaves yield between 0.7 and 0.8% essential oil. It is a good antiseptic[154]. Fairly tolerant of maritime exposure, it can be grown as part of a shelterbelt in maritime areas[75]. Wood is a good source

dwatta AntisepticEucalyptus leaves are a traditional Aboriginal herbal remedy. The essential oil found in the leaves is a powerful antiseptic and is used all over the world for relieving coughs and colds, sore throats and other infections[254]. The essential oil is a common ingredient in many over-the-counter cold remedies[254]. An essential oil obtained from the leaves is antiseptic[154]. The essential oil obtained from various species of eucalyptus is a very powerful antiseptic, especially when it is old, because ozone is formed in it on exposure to air. It has a decided disinfectant action, destroying the lower forms of life[4]. The oil can be used externally, applied to cuts, skin infections etc, it can also be inhaled for treating blocked nasal passages, it can be gargled for sore throat and can also be taken internally for a wide range of complaints[4]. Some caution is advised, however, because like all essential oils, it can have a deleterious effect on the body in larger doses[4].

nrakta Australia - New South Wales, Victoria. ksacta Forms extensive forests in mountainous areas to 2000 metres[77, 154].

propta Seed - surface sow February/March in a sunny position in a greenhouse[11, 78, 134]. Species that come from high altitudes appreciate 6 - 8 weeks cold stratification at 2°c[200]. Pot up the seedlings into individual pots as soon as the second set of seed leaves has developed, if left longer than this they might not move well. Plant out into their permanent positions in early summer and give them some protection from the cold in their first winter. The seed can also be sown in June, the young trees being planted in their final positions in late spring of the following year. The seed has a long viability[200].

nwatta Prefers a sunny position in a moderately fertile well-drained moisture retentive circum-neutral soil[200]. Succeeds in most soils but dislikes chalk or clay soils[98]. Tolerates poor soils, especially those low in mineral elements[200]. Tolerant of drought, dry soils[200] and exposed positions[75]. This is perhaps the hardiest species in this genus, it tolerates long periods down to -14°c and short periods as low as -20°c[107, 200]. Eucalyptus species have not adopted a deciduous habit and continue to grow until it is too cold for them to do so. This makes them more susceptible to damage from sudden cold snaps. If temperature fluctuations are more gradual, as in a woodland for example, the plants have the opportunity to stop growing and become dormant, thus making them more cold resistant. A deep mulch around the roots to prevent the soil from freezing also helps the trees to survive cold conditions. The members of this genus are remarkably adaptable however, there can be a dramatic increase in the hardiness of subsequent generations from the seed of survivors growing in temperate zones[200]. Eucalyptus monocultures are an environmental disaster, they are voracious, allelopathic and encourage the worst possible attitudes to land use and conservation[200]. A very ornamental tree[1], it grows very slowly in its first 2 or 3 years but is

soils must contain the proper nitrogen-fixing bacteria. When in the amino-acid methionine[240]. The protein has a high grown on the same land for 2 - 3 successive years, increasing yields are obtained year after year[269]. Seed can be purchased that has been treated with this rhizobium, it is unnecessary on soils with a pH below 5.5 but can be helpful on other soils[206]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen. Research at the University of Illinois has crossed Glycine max (annual soybean) with Glycine tomentella (perennial) which could lead to the production of a perennial edible sovbean [1-1].

# 8.1.4 Glycine spp.

Perennial Soybean

tfo2n 7 tlin 11 cyuc 4 kcak 4 tcan 3 dwat 0.6 m hkuc hmim cyutli tcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Glycine spp. is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

pcista In some species the raw mature seed is toxic and must be thoroughly cooked before being eaten[76].

kcakta Edible Parts: Leaves Oil Seed SeedpodEdible Uses: OilCarbon Farming Solutions - Staple Crop: protein-oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1]. Research at the University of Illinois has crossed Glycine max (annual soybean) with Glycine tomentella (perennial) which could lead to the production of a perennial edible soybean [1-1].

tcanta OilSee individual plant entries. dwatta See individual species. nrakta Cultivated origin. ksacta Unknown propta See individual plant entries.

nwatta Hypothetical Crop Management: dard Staple Crop: Protein-oilClimate: hypothetical, Humidity: semi-arid to humid. Carbon Farming Solutions - Cultivation: hypothetical. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

### 8.1.5 Lupinus angustifolius

Blue Lupin, Narrowleaf lupine tfo2n 7 tlin 9 cyuc 4 kcak 4 tcan 0 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Lupinus angustifolius is a ANNUAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from April to October, in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil

pcista The seed of many lupin species contain bittertasting toxic alkaloids, though there are often sweet varieties within that species that are completely wholesome[65, 76]. Taste is a very clear indicator. These toxic alkaloids can be leeched out of the seed by soaking it overnight and discarding the soak water. It may also be necessary to change the water once during cooking. Fungal toxins also readily invade the crushed seed and can cause chronic illness[65].

kcakta Edible Parts: SeedEdible Uses: Seed cooked[177]. Used as a protein-rich vegetable or savoury dish in any of the ways that cooked beans are used, they can also be roasted or ground into a powder. If the seed is bitter this is due to the presence of toxic alkaloids and the seed should be thoroughly leached before being cooked. The seeds of low-alkaloid varieties is used in making 'tempeh'[183]. The seed is rich in protein, though it is deficient digestibility (90%) and biological value(53%)[240].

tcanta Green manure quod green manure plant, it produces a good bulk of organic matter and fixes atmospheric nitrogen[200]. It also makes phosphorus in the soil more available to other plants[201].

nrakta Europe - Mediterranean. ksacta Cultivated and rocky ground on light acid soils [45, 50].

propta Pre-soak the seed for 24 hours in warm water and sow in mid spring in situ[1, 200]. You may need to protect the seed from mice. Germination should take place within 2 weeks. The seed can also be sown in situ as late as early summer as a green manure crop.

nwatta An easily grown plant, it succeeds in any moderately good soil[1]. Requires a sunny position[200]. Prefers a light acid soil[50] but tolerates adverse conditions. Dislikes limey soils[50]. Sometimes cultivated for its edible seeds. there are some named varieties that are low in the bitter toxic alkaloids. 'Uniwhite' is a low-alkaloid variety with a permeable seed coat. It has reduced pod-shattering[183] and so is easier to harvest mechanically. The blue lupin is a good companion plant for most vegetables[201]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200] When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their

# 8.1.6 Glycyrrhiza echinata

Wild Liquorice. Chinese licorice

tfo2n 7 tlin 10 cyuc 4 kcak 3 tcan 3 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Glycyrrhiza echinata is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Sweetener Tea-Root - raw or cooked. Very fibrous, it is often boiled to extract the sugars and is a source of Russian and German liquorice[183]. It is used as a confection, a sweetener and medicinally[2, 105, 177]. A delicious sweet flavour[K]. The dried root is often used for chewing, it is especially useful for teething children and as a tooth cleaner[K]. The root contains glycyrrhizin, a substance that is 50 times sweeter than sugar. A tea made from the roots is an excellent thirst quencher.

tcanta Nitrogen fixer. Dynamic accumulator.

dwatta Alterative Expectorant TonicThe root is alterative, expectorant and tonic. It is usually mixed with other herbs, partly at least to improve their taste[178].

nrakta S. Europe. ksacta Muddy places by rivers[45].

propta Pre-soak the seed for 24 hours in warm water and then sow spring or autumn in a greenhouse [200]. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on for their first winter in a greenhouse. Plant out in late spring or early summer when in active growth. Plants are rather slow to grow from seed[238]. Division of the root in spring or autumn. Each division must have at least one growth bud. Autumn divisions can either be replanted immediately or stored in clamps until the spring and then be planted out [200]. It is best to pt up the smaller divisions and grow them on in a cold frame until they are established before planting them out in the spring or summer.

nwatta Requires a deep well cultivated fertile moistureretentive soil for good root production[200]. Prefers a sandy soil with abundant moisture[238]. A slightly alkaline soil produces the best plants[238]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Cultivated for its medicinal root in S. Europe[50]. Unless seed is required, the plant is usually prevented from flowering so that it puts more energy into producing good quality roots[238]. A very deep-rooted plant,

bers of this genus are attracting considerable interest from breeding institutes for their nutrient-rich fruits that can promote the general health of the body (see edible and medicinal uses below)[214]. The deeply cleft bark favours the growth of epiphytes[146]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Dioecious. Male and female plants must be grown if seed is required.

## 8.1.3 Glycine max

tfo2n 7 tlin 10 cvuc 4 kcak 4 tcan 2 dwat m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Glycine max is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist

pcista The raw mature seed is toxic and must be thoroughly cooked before being eaten[76]. The sprouted raw seed is sometimes eaten and is considered to be a wholesome

kcakta Edible Parts: Leaves Oil Oil Seed SeedpodEdible Uses: Coffee Milk Oil OilMature seed - cooked[2, 33]. The seeds furnish one of the world's most important sources of oil and protein, they can be eaten as they are in soups, stews etc[183, 269], though they are also very commonly used in the preparation of various meat substitutes [34, 46]. The dried seed can be ground into a flour and added to cereal flours or used for making noodles etc[183]. The Japanese make a powder from the roasted and ground seed, it is called 'Kinako' and has a nutty flavour and fragrance - it is used in many popular confections[183]. The sprouted seed is eaten raw or added to cooked dishes. The toasted seeds can be eaten as a peanut-like snack[183]. The seed is also made into numerous fermented foods such as miso and tempeh[183] and is also used to make soya milk, a valuable protein supplement in infant feeding which also provides curds and cheese[269]. The seed contains 20% oil and 30 - 45% protein[100]. All seeds on a soybean plant mature at essentially the same time. Maturity of the seed is accompanied by a rapid dropping of the leaves and drying of the stems[269]. Average yield of beans is about 1700 kg/ha[269]. High-yielding cvs, adapted to the locality and grown under proper culture and favourable conditions will yield more than twice the average vield[269]. The immature seed is cooked and used like peas or eaten raw in salads[105, 183]. The strongly roasted and ground seeds are used as a coffee substitute[183]. The young seedpods are cooked and used like French beans[116, 183]. An edible semi-drying oil is obtained from the seed[269]. It is cooked or can be used as a dressing in salads etc and for manufacture of margarine and shortening[34, 183, 269]. Young leaves - raw or cooked[179,

tcanta Biomass Green manure Oil Oil PaperThe seed contains up to 20% of an edible semi-drying oil[171, 269]. It is non-drying according to another report[57]. This oil has a very wide range of applications and is commonly used in the chemical industry[171, 206]. The oil is used industrially in the manufacture of paints, linoleum, oilcloth, printing inks, soap, insecticides, and disinfectants[34, 46, 100, 269]. Lecithin phospholipids, obtained as a by-product of the oil industry, are used as a wetting and stabilizing agent in food, cosmetic, pharmaceutical, leather, paint, plastic, soap, and detergent industries[269]. Both the meal and the soy bean protein are used in the manufacture of synthetic fibre, adhesives, textile sizing, waterproofing, fire-fighting foam and many other uses[269]. The plant is sometimes grown as a green manure[269]. The straw can be used to make paper, stiffer than that made from wheat straw[269]. The plant is an excellent source of biomass. The oil from the seeds can

be used as a diesel fuel whilst the stems can be burnt as a

dwatta Antidote Astringent Diaphoretic Laxative Ophthalmic Resolvent StomachicThe fermented seed is weakly diaphoretic and stomachic[176]. It is used in the treatment of colds, fevers and headaches, insomnia, irritability and a stuffy sensation in the chest[176]. The bruised leaves are applied to snakebite[218]. The flowers are used in the treatment of blindness and opacity of the cornea[218]. The ashes of the stems are applied to granular haemorrhoids or fungus growths on the anus[218]. The immature seedpods are chewed to a pulp and applied to corneal and smallpox ulcers[218]. The seed is antidote[218]. It is considered to be specific for the healthy functioning of bowels, heart, kidney, liver and stomach[218, 269]. The seed sprouts are constructive, laxative and resolvent[218]. They show an oestrogenlike activity in the body and are also antispasmodic[279]. The sprous are used in the treatment of oedema, dysuria, chest fullness, decreased perspiration, the initial stages of flu and arthralgia[176]. A decoction of the bark or root is astringent[240, 269]. Soybean diets are valued for treating acidosis[269]. Since soybean oil has a high proportion of unsaturated fatty acid, it is recommended, like safflower, poppy seed, etc. to combat hypercholesteremia[269]. Commercial grades of natural lecithin, which are often derived from sovbean, are reported to contain a potent vasopressor. Medicinally lecithin is indicated as a lipotropic agent[269]. Sovbean is listed as a major starting material for stigmasterol, once known as an antistiffness factor. Sitosterol, also a sov by-product, has been used to replace diosgenin in some antihypertensive drugs[269].

nrakta E. Asia. ksacta Lowland thickets. C. and S.

propta Pre-soak the seed for 12 hours in warm water and then sow in early spring in a greenhouse. The seed should germinate within two weeks at a temperature between 12 -16°c[206]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring or early summer, after the last expected frosts. Seed can also be pre-soaked for 12 hours in warm water and then sown in situ in late spring, though this will not yield well unless the summer is very hot.

nwatta A fairly easily-grown plant, it grows best in a sunny position on fertile, well-drained soils[33, 38], but does tolerate a wide range of soil conditions[269]. Soybeans will brow better than many crops on soils that are low in fertility, droughty or poorly drained[269]. Prefers a well-drained sandy soil[1]. Prefers a slightly acid soil[200, 206]. Soya does not grow well in a wet climate[132], nor will it withstand excessive heat or severe cold winters[269]. The plant has been reported to tolerate an annual precipitation in the range of 31 to 410cm (though it requires at least 50cm for a good crop), an annual mean temperature range of 5.9 to 27°C and a pH in the range of 4.3 to 8.4 (preferring 6 - 6.5)[269]. Soya is one of the most widely cultivated plants in the world, being grown for its oil and protein rich edible seed, there are many named varieties[183, 206, 269]. A subtropical plant, but its cultivation extends from the tropics to as far north as latitude 52°N[269]. The species, and most of its cultivars, is a short-day plant and does not flower or set seed unless the daylight hours are less than 13 hours per day[269]. There are three basic types of soya bean, those with green seeds are considered to be the most tender and best flavoured and are the type best suited for northern climates. Black seeded forms are normally used dried and yellow seeded forms are used for making soya milk, flour etc[206]. The plant requires a hot summer with a mean July temperature between 16 and 18°c[206] and a dry autumn if it is to do well in Britain[1, 33], though it is as hardy as the runner bean, Phaseolus coccineus[1]. The best crops outdoors in Britain are obtained if the plants are started off in a greenhouse and planted out in late spring although a direct sowing outdoors in early May can succeed in good summers but yields will then normally be low. Many cultivars will not flower in the shorter days of late summer in the northern hemisphere and so are not suitable for growing in Britain[206]. Some botanists separate the cultivated forms of soya from this species and call them G. soja. Sieb. and Zucc[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Soybean then capable of growing 1 metre or more a year[11]. Plants self-sow in Devon[1]. Plants are shallow-rooting and, especially in windy areas, should be planted out into their permanent positions when small to ensure that they do not suffer from wind-rock[245]. They strongly resent root disturbance and should be container grown before planting out into their permanent position[11]. In Australia this species usually regenerates from the base after forest fires[167]. The flowers are rich in nectar and are a good bee crop[200].

# 7.2.512 Buddleia globosa

Orange Ball Tree

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Buddleia globosa is an evergreen Shrub growing to 5 m (16ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

dwatta MiscellanyOne report says that it is cultivated as a medicinal plant in S. America but gives no more details[184].

nrakta S. America - Argentina, Chile, Peru. ksacta Found at altitudes up to 2000 metres.

propta Seed - cold stratify for 4 weeks at 4°c[138] and surface sow the seed in February/March in a greenhouse[78, 113]. Germination usually takes place within 3 - 4 weeks at 21°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Seedlings are inclined to damp off and so should be watered with care and kept well-ventilated[78]. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Use short side-shoots[78]. Very high percentage[113]. Cuttings of mature wood of the current season's growth, 15 -20cm long, October/November in a frame[200].

nwatta Requires a sunny position[11, 182]. Prefers a rich loamy well-drained soil[11, 200]. Very tolerant of alkaline soils[200]. Grows well by the sea, tolerating maritime exposure[184, 200]. Plants are hardy to about -15°c if they are sheltered from cold winds[184, 200]. They resprout freely from the base if cut back by cold weather[200] and are deciduous in cold winters[188]. Plants flower on the previous year's growth[200]. The flowers scent the air for a considerable distance with their sweet honey-like fragrance[245].

# 7.2.513 Rhododendron ponticum

Rhododendron

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 5 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Rhododendron ponticum is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil

pcista Although no specific mention of toxicity has been seen for this species, it belongs to a genus where many members have poisonous leaves. The pollen of many if not all species of rhododendrons is also probably toxic, being said to cause intoxication when eaten in large quantities[183].

tcanta Hedge HedgePlants are being grown as a hedge at the RHS gardens in Wisley, Surrey[29]. It tolerates quite hard clipping[200].

dwatta Antirheumatic CardiacA medicine made from the plant is used to treat heart and circulation malfunctions, but it should not be used without expert supervision[9].

nrakta W. Europe to the Caucasus and Lebanon. Naturalized in Britain[17]. ksacta Rich forests under Fagus, Picea and Abies species, it is also found above the tree line[11]. Sandy and peaty soils in woods and open places in Britain[17]

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn and given artificial light. Alternatively sow the seed in a lightly shaded part of the warm greenhouse in late winter or in a cold greenhouse in April. Surface-sow the seed and do not allow the compost to become dry[200]. Pot up the seedlings when they are large enough to handle and grow on in a greenhouse for at least the first winter. Layering in late July. Takes 15 - 24 months[78]. Cuttings of half-ripe wood. August in a frame. Difficult[78].

nwatta Succeeds in a most humus-rich lime-free soils except those of a dry arid nature or those that are heavy or clayev[1]. Prefers a peaty or well-drained sandy loam[1]. A pH between 4.5 and 5.5 is ideal[1]. Succeeds in sun or shade, the warmer the climate the more shade a plant requires [184, 2001. Hardy to about -15°c[184]. Plants are self-sowing aggressively in British woodlands and are often out-competing native trees by filling the understorey and preventing natural regeneration. They are considered to be a pernicious weed by many environmentalists. Succeeds in a woodland though, because of its surface-rooting habit[200], it does not compete well with surface-rooting trees[1]. Plants need to be kept well weeded, they dislike other plants growing over or into their root system, in particular they grow badly with ground cover plants, herbaceous plants and heathers[200]. Plants form a root ball and are very tolerant of being transplanted, even when quite large, so long as the root ball is kept intact[200]. Plants in this genus are notably susceptible to honey fungus[200].

### 7.2.514 Hebe salicifolia

6 tlin 9 cyuc 0 kcak 3 tcan 1 dwat 4.5 m hkuc

htut cyutli tcup hwicli hyishrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Hebe salicifolia is an evergreen Shrub growing to 4.5 m (14ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution

tcanta Hedge HedgeA very wind resistant shrub, it can be grown as a shelter hedge in exposed maritime positions. Attractive flowers.

dwatta Antispasmodic DysenteryTreats dysentery, having an antiperistaltic action[153].

nrakta New Zealand. S. America - Chile. ksacta Many

habitats in South and Stewart Islands in New Zealand[44]. propta Seed - we have no information on this species

but suggest sowing the seed in a greenhouse in spring. Only just cover the seed and do not allow the compost to dry out. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the young plants for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts. It would probably be worthwhile giving some protection to the plant for its first winter outdoors. Cuttings of half ripe wood, 3 - 5cm with a heel, July/August in a frame. Pot up when roots are forming and keep in a frame or greenhouse for its first winter before planting out in late spring. Cuttings of mature wood, late autumn or winter in a frame.

nwatta Succeeds in most soils so long as they are not boggy or too dry[182]. Prefers a light well-drained soil[1, 166] and a sunny position[200]. Prefers a moist rich soil[166] but plants are probably hardier in a soil that is on the poor side[1]. Lime tolerant[11]. Intolerant of drought[166]. Tolerates atmospheric pollution[200]. Very wind resistant, withstanding maritime exposure[166]. A polymorphic species[200], it hybridizes freely with other members of this genus. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth behaviour makes it easier to maintain without having to apply containment methods[2-1].

#### 7.2.515 Tamarix chinensis

Chinese Tamarisk, Five-stamen tamarisk 6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 4.5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatprikl-wissliphsom hpa7tmwatli xre7t hjonli

drutta Tamarix chinensis is a deciduous Shrub growing to 4.5 m (14ft 9in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

tcanta Hedge HedgeVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens.

dwatta Analgesic Antivinous Carminative Depurative Diuretic Febrifuge VulneraryThe leaves are analgesic, antipyretic, antivinous, carminative, depurative, diuretic, febrifuge[147, 218]. Aids measles rash surfacing[147]. The wood is used in the treatment of anthrax-like sores[218] A manna from the plant is vulnerary[218].

nrakta E. Asia - China. ksacta Roadsides and stream edges, mostly as the result of cultivation[147].

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11], plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. This species flowers on the current year's growth[227]. Any pruning is best carried out in spring, hedges are also best trimmed at this time[188]. Plants are tolerant of severe pruning, sprouting freely from old wood[K]. Very closely related to T. ramosissima[11]. This plant is often mis-identified as T. gallica[50] or T. indica[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 7.2.516 **Jasminum nudiflorum**

Winter-Flowering Jasmin, Winter jasmine 6 tlin 11 cyuc 0 kcak 0 tcan 1 dwat 3.6 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli frusflatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Jasminum nudiflorum is a deciduous Shrub growing to 3.6 m (11ft) by 4.5 m (14ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from December to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland)

semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

tcanta Soil stabilizationA good soil stabilizer for steep banks, succeeding in shady positions[2001. The sprawling branches make this a good plant for ground cover, the plants should be spaced about 1.8 metres apart each way[208].

dwatta DiaphoreticDiaphoretic[178].

nrakta E. Asia - W. China. Locally naturalized in France. ksacta Thickets, ravines and slopes at elevations of 800 - 4500 metres in western China[266].

propta Seed - best sown as soon as it is ripe in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Cuttings of mature wood in November. Layering.

nwatta Landscape Uses: Arbor, Cascades, Erosion control, Foundation, Ground cover, Massing, Screen, Standard. Succeeds in a good well-drained loam[1]. Grows well in heavy clay soils. Prefers a good soil and a sunny position but succeeds in shade[11, 28, 49], including on a north facing wall[200]. Tolerates very poor soils, whether acid or alkaline[202]. Tolerates urban pollution[200]. A very ornamental plant[1], it is hardy to about -15°c[184]. Some winter die-back can be experienced and flowers can be damaged in severe winters but new flowers are usually produced when the weather warms up[202]. A winter-flowering plant, flowering mainly on wood that was produced the previous summer[219]. Pruning can be carried out in early to mid spring once flowering has finished[202, 219]. Removing one third of the oldest growth down to ground level rejuvenates the plant and encourages greater flowering[202]. Unpruned plants tend to become woody and matted with dead stems[219]. The flowers have a delicate mossy perfume[245]. This species does not set seed in British gardens. This might be because all the plants in cultivation stem from one original importation[182]. An ideal plant for growing on shady walls and banks[28, 49]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Attractive flowers or blooms.

# 7.2.517 Garrya fremontii

Fever Bush, Bearbrush

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 3 m hkuc pcimhmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Garrya fremontii is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric nollution

dwatta Antiperiodic TonicThe leaves are intensely bitter and are used as an antiperiodic and tonic[4]. They can be used as a guinine substitute[4].

nrakta South-western N. America - California and Oregon. ksacta In dry situations in chaparral, mixed evergreen, yellow pine and red fir forests at elevations from sea level to 2200 metres[276].

propta Seed - best sown as soon as it is ripe in a cold frame. Very slow, the seed can take 2 or more years to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10cm with a heel, August in a frame[200]. Cuttings of mature wood 10 - 12 cm with a heel, December/January in a frame[200].

# B 7 tlin

## 8.1 **bwon**

### 8.1.1 Lens culinaris

Lenti

tfo2n 7 tlin 12 cyuc 5 kcak 3 tcan 1 dwat 0.5 m hkuc htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Lens culinaris is a ANNUAL growing to 0.5 m (fishin). It is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Cleistogomy (self-pollinating without flowers ever opening). The plant is self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Seed SeedpodEdible Uses: Seed - cooked or sprouted and eaten raw[1]. A very nutritious food[171, 177], the seeds can be cooked on their own or added to soups, stews etc[183]. The seed can be soaked for 12 hours in warm water and then allowed to sprout for about 5 days[244]. They have a crunchy, fresh flavour[244]. Lentils are more digestible than many legumes[K]. The dried seed can also be ground into a powder and used with cereal flours in making bread etc[183], this greatly enhances the value of the protein in the bread. The seed stores better if it is left in its husk[200]. Young seedpods - used fresh or cooked like green beans[61, 177, 183].

tcanta Fuel Green manureAgroforestry Uses: The plant can be used as a green manure[418]. Lentil is mainly grown as a sole crop, but sometimes mixed with other crops, e.g. in India with barley, mustard or castor[299]. Other Uses: The seeds are a source of starch for the textile and printing industries[310, 418]. The plant remains, after the seed has been harvested, can be used as a fuel[299].

dwatta Laxative PoulticeThe seeds are mucilaginous and laxative[240]. They are considered to be useful in the treatment of constipation and other intestinal affections[240]. Made into a paste, they are a useful cleansing application in foul and indolent ulcers[240].

nrakta Original habitat is obscure, possibly the Mediterranean. ksacta Not known in the wild.

propta Seed - sow early April in situ[1]. Some cultivars are probably suitable for sowing outdoors in the autumn, at least in the milder parts of the country[200].

nwatta An easily grown plant[K], it prefers a sandy soil in a warm sunny sheltered position[27, 37, 200]. Another report says that it does best on clay[37]. It produces most seed when grown on poorer soils[37]. Lentils are widely cultivated in warm temperate and tropical zones for their edible and very nutritious seed, there are many named varieties[183]. The plants are much hardier than is commonly supposed and many of these varieties can succeed in Britain, particularly in warm summers. There is at least one, called 'WH2040', that can withstand temperatures as low as -23°c in the seedling stage[200], 'Chilean' is a low-growing plant that can be grown in the winter in areas where winter vegetables can be grown[183]. 'HarLen' tolerates temperatures down to -10°c and performs very well in gardens[183]. The plants take the same time as peas to mature, so lentils are a potential commercial crop for Britain[141]. Yields of up to 2 tonnes per hectare are possible[200]. The main problem with growing them as a commercial crop is that they are produced by using cheap labour in many countries which makes it very difficult for British farmers to compete on prices. However, this does not preclude their being grown in the garden and allotment. Lentils are also beneficial to grow as part of a rotation on the farm or garden. They have a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby and, if the roots are left in the ground when the seeds are harvested, this will provide a source of nitrogen for the next crop[200].

# 8.1.2 Hippophae tibetana

Tibetan Sea Buckthorn

tfo2n 7 tlin 10 cyuc 4 kcak 0 tcan 3 dwat 15 m hkuc htut cyutli kyuctcuphja7n hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Hippophae tibetana is a deciduous Tree growing to 15 m (49ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in April, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry moist or wet soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 46, 272]. Very rich in vitamin C, but too acid when raw for most peoples tastes. The flavour is somewhat lemonlike[K]. The fruits of some species and cultivars (not specified) contain up to 9.2% oil[214]. Used for preserves[105, 183]. The fruit becomes less acid after a frost or if cooked. This species has the largest fruits of the genus, 100 fruits weighing around 40d[214].

tcanta Cosmetic FuelThe wood is used for fuel[146, 272]. A red cosmetic is obtained from the ripe fruit[272].

dwatta Antitussive Blood purifier Cancer Cardiac Eczema Expectorant Poultice Vitamin CThe tender branches and leaves contain bio-active substances which are used to produce an oil that is quite distinct from the oil produced from the fruit. This oil is used as an ointment for treating burns[214]. A high-quality medicinal oil is made from the fruit and used in the treatment of cardiac disorders, it is also said to be particularly effective when applied to the skin to heal burns, eczema and radiation injury, and is taken internally in the treatment of stomach and intestinal diseases[214]. The fruit is used in Tibetan medicine, it is said to have a sour taste and a neutralizing and sharpening potency[241]. Antitussive, blood purifier and expectorant, it is used in the treatment of disorders of the lungs, inflammation of the pulmonary tract, difficulty in expelling phleam and coagulation and clotting of the blood[241]. The fruit is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers[214].

nrakta E. Asia - Himalayas. ksacta Open sunny places in montane areas, rarely found below 3000 metres[214]. Rocky and sandy ground at elevations of 3800 - 4200 metres in Nepal[272].

propta Seed - sow spring in a sunny position in a cold frame[78]. Germination is usually quick and good although 3 months cold stratification may improve the germination rate. Alternatively the seed can be sown in a cold frame as soon as it is ripe in the autumn. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a greenhouse for their first winter. Plant out in late spring into their permanent positions. Male seedlings, in spring, have very prominent axillary buds whilst females are clear and smooth at this time[78]. Cuttings of half-ripe wood, June/July in a frame[200]. Difficult[113]. This is the easiest method of vegetative propagation[214]. Cuttings of mature wood in autumn[200]. Difficult[113]. The cuttings should be taken at the end of autumn or very early in the spring before the buds burst. Store them in sand and peat until April, cut into 7 - 9cm lengths and plant them in a plastic tent with bottom heat[214]. Rooting should take place within 2 months and they can be put in their permanent positions in the autumn[214]. Division of suckers in the winter. They can be planted out direct into their permanent positions and usually establish well and quickly[K]. Layering in autumn[200].

nwatta Succeeds in most soils if they are not too dry[200]. Grows well by water[1, 11]. A fast-growing and very wind-resistant tree, an excellent pioneer species[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°c[200]. Mem-

tcanta DyeA blue dye like indigo can be obtained by fermentation of the leaves[4].

dwatta Cardiac Cathartic Diuretic LaxativeThe twigs and leaves have a similar action to the common broom, Cytisus scoparia[4]. They are collected as the plant comes into flower and can be stored for later use. They are diuretic, cardiac, cathartic and laxative[4].

nrakta S. Europe. ksacta A common weed of cultivated ground.

propta Seed - sow early spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring.

nwatta Requires a light well-drained soil in full sun[200].

## 7.2.580 Aster diplostephioides

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Aster diplostephioides is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

dwatta Antidote Febrifuge Haemostatic TonicThis plant is said to have medicinal properties, but no details were given in the report[145]. The flowers are used in Tibetan medicine, they are said to have a bitter taste and a cooling potency[241]. Antidote, febrifuge, haemostatic and tonic, they are used in the treatment of infectious fevers, influenza, nose bleeds, poisoning, sores from environmental poisoning and an inability to stretch or contract the limbs[241].

nrakta E. Asia - Himalayas from Kashmir to Sikkim ksacta Alpine pastures, 3000 - 3800 metres[145].

propta Seed - surface sow in spring in a cold frame. Do not allow the compost to become dry. Pre-chilling the seed for two weeks can improve germination rates[134]. Germination usually takes place within 2 weeks at 20°c[134]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200].

nwatta Succeeds in most good garden soils[1], preferring one that is well-drained and moisture retentive[200]. Prefers a sunny position[200]. A very ornamental plant[1], it grows well in a rock garden[1]. Most species in this genus seem to be immune to the predations of rabbits[233]. Hybridizes freely with other members of this genus[200].

# 7.2.581 Convolvulus scammonia

Scammony

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.8 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli priklwis hpa7tmwatli fyifxre7t hjonli

drutta Convolvulus scammonia is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil

dwatta Cathartic HydrogogueA resin is obtained from the root. The earth is cleared away from the top of the root, the top is then cut off obliquely about 5cm below the point where the stalks spring forth. The exuding juice is collected, which gradually hardens[4]. This resin is a drastic cathartic and hydrogogue and should be used with great caution[4, 46, 61]. The roots contain about 8% resin[240].

nrakta Europe - Mediterranean, to W. Asia. ksacta Scrub and forest margins[50].

propta Seed - sow spring in a greenhouse[164]. Germination can be slow and erratic, a period of cold stratification

might help reduce the germination period. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts. Division in spring. Cuttings of young shoots, August in a frame in sand[1].

nwatta Prefers a light basic sharply drained soil of low to medium fertility[4, 200]. Prefers a sunny sheltered position. Thrives in dry soils[4] and succeeds in ordinary garden soils. The root can be up to 1.2 metres long, so for best results a deep soil is required[4].

# 7.2.582 Erysimum cheiri

Wallflower, Aegean wallflower

6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 0.5 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli priklwisslip hpa7tmwatli xre7t hjonli

drutta Erysimum cheiri is an evergreen Perennial growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

pcista The plant is said to be poisonous if used in large quantities[7].

tcanta EssentialThe flowers contain 0.06% essential oil[240]. It has a pleasing aroma if diluted and is used in perfumery[46, 61, 114, 244]. The seed contains about 20% fixed oil[240], but no details of any uses are given[K].

dwatta Antirheumatic Antispasmodic Aphrodisiac Cardiotonic Diuretic Emmenagogue Expectorant Nervine Ophthalmic Purgative Resolvent Stomachic TonicWallflower was formerly used mainly as a diuretic and emmenagogue but recent research has shown that it is more valuable for its effect on the heart [254]. In small doses it is a cardiotonic, supporting a failing heart in a similar manner to foxglove (Digitalis purpurea)[254]. In more than small doses, however, it is toxic and so is seldom used in herbal medicine[254]. The flowers and stems are antirheumatic, antispasmodic, cardiotonic, emmenagogue, nervine, purgative and resolvent[4]. 7, 46, 61, 240]. They are used in the treatment of impotence and paralysis[240]. The essential oil is normally used[4]. This should be used with caution because large doses are toxic[7]. The plant contains the chemical compound cheiranthin which has a stronger cardiotonic action than digitalis (obtained from Digitalis species). If taken in large doses this is very poisonous and so this plant should not be used medicinally without expert supervision[244]. The seeds are aphrodisiac, diuretic, expectorant, stomachic and tonic[240]. They are used in the treatment of dry bronchitis, fevers and injuries to the eyes[240].

nrakta S. Europe. Naturalized in lowland Britain[17]. ksacta Walls, cliffs and rocks, often near the sea in Britain[4,

propta Seed - sow spring in an outdoor seedbed. Germination should take place within 3 weeks. Plant the seedlings into their permanent positions when they are large enough to handle. If seed is in short supply, it can be sown in spring in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer.

nwatta Prefers a position in full sun in a circumneutral soil[1, 111, 200]. Succeeds in ordinary garden soils[1], tolerating poor and limey soils[187]. Plants are liable to die out if the soil is too rich[111]. Wallflowers are perennial, though they are usually grown as biennials in the flower garden for spring and early summer bedding[1]. There are some named varieties[187]. A very ornamental plant[7], it is liable to die out after flowering, probably because it exhausts itself by producing so many flowers. Plants require a very well-drained dry soil if they are to survive a second winter[187]. They grow well on dry stone walls[201] and also on old mortared walls where they usually self-sow[219]. A good butterfly and moth plant[17, 30]. A good companion for apple trees[18, 20, 201].

nwatta Prefers a sunny position succeeding in most welldrained fertile soils[182, 200, 202]. Succeeds in a hot dry position. Succeeds in light shade[202], the plants are also tolerant of quite deep shade[219]. Does not require a rich soil or abundant moisture[11], if the soil is too fertile the flowering will be delayed[200]. Resistant to urban pollution and maritime exposure but are subject to wind scorch from cold drying winds in colder areas[200]. Hardy to about -15°c[184], it is best on a sunny wall in most parts of the country but does very well as a free standing shrub in Devon and Cornwall[11]. In cold winters and springs the previous year's leaves may fall before the new leaves are produced[202]. The plant strongly resents root disturbance[1, 11] and should be placed in its permanent position as soon as possible. The plant flowers on wood produced the previous summer[200]. All pruning should be carried out in spring before new growth starts but after flowering has ended[1]. Dioecious. Male and female plants must be grown if seed is required.

# 7.2.518 Skimmia japonica

Japanese Skimmia

6 tlin 7 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc

pcimhmimhtut cyutli tcup hwicil hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Skimmia japonica is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

pcista A poisonous alkaloid called 'skimmianin' is found in all parts of the plant[211].

tcanta Plants can be grown as a ground cover when planted about 1 metre apart each way[208].

dwatta Carminative Restorative TonicThe poisonous stems are carminative, restorative and tonic[178, 218].

stems are carminative, restorative and tonic[178, 218].
nrakta E. Asia - Japan. ksacta Woods, sometimes as an
epiphyte on old Cryptomeria spp trees, in C. and S. Japan[58].
propta Seed - can be sown as soon as it is ripe in a

propta Seed - can be sown as soon as it is ripe in a cold frame[K]. It also succeeds when sown in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If there is sufficient seed then it can be sown can be in an outdoor seedbed in early spring[200]. Grow the plants on in the seedbed for a couple of years before planting them out in late autumn or early spring. Cuttings of half-ripe wood, July/August in a cold frame[11]. Cuttings of nearly mature side shoots, 7 - 10cm with a heel, September in a cold frame. Slow to root, they should be left for 18 months before moving to their permanent positions. Good percentage[78]. Layering in autumn. Takes 18 months. Good to high percentage[78].

nwatta Landscape Uses:Border, Container, Foundation, Pest tolerant, Massing, Woodland garden. Succeeds in a well-drained open loam or in a peaty soil[11, 200] preferring a rich slightly acid soil[184]. Thrives in moderately shady positions[11, 200] but also succeeds in full sun where the leaves may be rather yellow but the plant will flower and fruit better[200]. Plants are very tolerant of atmospheric pollution[184], being unharmed by deposits of soot or a sulphur-laden atmosphere[245]. Plants are hardy to about -15°c[184]. Often cultivated in the ornamental garden, there are many named varieties. The flowers have a sweet perfume[245]. Those of male forms are more aromatic than females[1], whilst the variety 'Fragrans' has a stronger scent like lily of the valley[245]. The bruised leaves are pleasantly aromatic[245]. The fruit is seldom eaten by birds, usually hanging on the plant until it flowers the following year[182]. A polymorphic species, it is usually dioecious but some forms are hermaphrodite, especially in ssp. reevesiana. (Fortune.) N.P.Taylor. and Airey Shaw[200]. This sub-species

is intolerant of chalky soils[182] and is also much taller than the type. Another report says that it is smaller and weaker-growing than the type species[188]. Special Features:Not North American native, Fragrant flowers, Attractive flowers or blooms.

# 7.2.519 Inula racemosa

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 2 m hkuc

htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Inula racemosa is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

dwatta AnalgesicThe rhizome is used in Tibetan medicine, it is said to have a sweet, bitter and acrid taste with a neutral potency[241]. It is used in the treatment of containious fevers that have not fully ripened and pain in the upper body, especially between the neck and the shoulders[241].

nrakta E. Asia - Western Himalayas. ksacta Borders of fields to an elevation of 3,000 metres.

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in ordinary garden soil[1]. Requires a moist well-drained soil in sun or partial shade[187]. Grows well in heavy clay soils. A vigorous plant, it can be naturalised in the wild garden or other informal positions[200]. Plants take some years to become fully established[233].

# 7.2.520 Ipomoea purpurea

Common Morning Glory, Tall morning-glory 6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 2.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ipomoea purpurea is a ANNUAL CLIMBER growing to 2.5 m (8ft 2in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

dwatta Anthelmintic Diuretic Hallucinogenic LaxativeThe seed is anthelmintic, diuretic and laxative[176]. It is used in the treatment of oedema, oliguria, ascariasis and constipation[176]. The seed contains small quantities of the hallucinogen LSD[200, 219]. This has been used medicinally in the treatment of various mental disorders.

nrakta Central America - Mexico to the West Indies. ksacta Scrub and waste places[260]. Stream banks, disturbed or waste areas[274]

propta Pre-soak the seed for 12 hours in warm water, or scarify the seed, and sow in individual pots in a greenhouse in early spring. The seed usually germinates in 1 - 3 weeks at 22°c. Plants are extremely resentful of root disturbance, even when they are quite small, and should be potted up almost as soon as they germinate[219]. Grow them on fast in the greenhouse and plant them out into their permanent positions after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away activaly.

nwatta Landscape Uses:Arbor, Container, Specimen. Requires a fertile well-drained loam in a sunny position[200]. The plant is not very frost hardy, but it can be grown outdoors as a tender annual in temperate zones[200]. A very ornamental plant, there are several named varieties[2001. The flowers

are blue, but they turn more pink later in the day[260]. Special Features: Not North American native, Wetlands plant, Attractive flowers or blooms.

## 7.2.521 Argemone albiflora

White Prickly Poppy, Bluestem pricklypoppy 6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkuc htut cyutli hgatkyuctcup hwicli hyishras hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Argemone albiflora is a ANNUAL growing to 1.5 m (5ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) soils, prefers welldrained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can

pcista All parts of the plant, including the seed, contain toxic alkaloids[222].

dwatta Demulcent Emetic Purgative SkinA tea made from the leaves is demulcent, emetic and purgative[222]. Caution is advised, the seed oil can cause glaucoma and oedema[222]. An infusion of the plant is used in the treatment of jaundice, skin ailments, colds, colic and wounds[222].

nrakta Southern N. America - Connecticut to Florida and west to Texas and Illinois. ksacta Waste places[222]. Waste places, roadsides, fields, beaches, dunes and coastal plains from sea level to 300 metres[270].

propta Seed - sow April in situ[200]. The seed usually germinates in 3 - 4 weeks at 15°c[134].

nwatta Easily grown in ordinary light soil in a sunny position[200]. Does best in a poor well-drained soil, often selfsowing on stony and sandy sites[200]. Plants resent root disturbance and are best sown in situ[134].

# 7.2.522 Codonopsis tubulosa

6 tlin 9 cvuc 0 kcak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasilut hpa7tli flatprik hpa7tmwatli xre7t hionli

drutta Codonopsis tubulosa is a PERENNIAL CLIMBER growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Adaptogen Aphrodisiac TonicThis species is an important herb in Chinese medicine, the root is widely used as a substitute for ginseng[238]. It is a sweet, warm, soothing herb that is taken as an energy tonic[238]. It acts mainly on the spleen, lungs and stomach, raising secretion of body fluids and blood sugar levels, lowering the blood pressure and stimulating the immune system[238]. It is taken internally in the treatment of low energy, poor appetite and digestion, anaemia, shallow breathing and debility after illness[238]. It is often cooked with rice until it is glutinous as a tonic food[238]. The roots of plants at least three years old are harvested in the autumn and can be used fresh or dried[238].

nrakta E. Asia - Southwest China. ksacta Alpine brush and rocky slopes[200].

propta Seed - surface sow in spring to early summer in an ericaceous compost in a greenhouse. Do not allow the compost to dry out. The seed usually germinates in 1 - 6 weeks at 20°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in a greenhouse for their first winter. Plant out in late spring or early summer and protect them from slugs until the plants are well established[K]. Division in spring, with care, since the plant resents root disturbance[200]. We have found it best to take small divisions that are teased out from the sides of the main clump so as to cause the least possible disturbance to the plants and to avoid having to dig up

1252

the clump. These small divisions need to be potted up and placed in light shade in a greenhouse until they are rooting well. They can be planted out into their permanent positions in the summer if they are large enough, otherwise in the fol-

nwatta Prefers a well-drained fertile light soil in full sun or semi shade[1, 200]. It only succeeds in full sun if the soil remains moist during the growing season[200]. Prefers a slightly acid soil[164]. Quite cold-hardy when dormant, the young growth in spring, even on mature plants, is frosttender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. An important herb in Chinese medicine, it is widely cultivated there and is used as a ginseng substitute[238]. A climbing plant, supporting itself by twining and scrambling over other plants[219]. Plants resent root disturbance and should be planted out into their permanent position as soon as possible [164]. Plants are very susceptible to the ravages of slugs. The young shoots in spring are particularly at risk, though older growth is also

### 7.2.523 Angelica sinensis

Dang Gui - Dong Quai - Chinese Angelica 6 tlin 9 cyuc 0 kcak 0 tcan 5 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Angelica sinensis is a PERENNIAL growing to 1 m (3ft 3in) by 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista All members of this genus contain furocoumarins, which increase skin sensitivity to sunlight and may cause dermatitis[238]. High doses over 500 mg a day may cause abdominal bloating and menstrual timing/flow changes. Unproven information suggests it can effect heart rhythm and lower blood pressure [301]. Caution is needed for diabetics, acute viral infections, (e.g. influenza) and with treatments with anticoagulants (e.g. warfarin)[301].

tcanta This plant is said to contain vitamin B12[176].

dwatta Alterative Analgesic Anticholesterolemic Antiinflammatory Antispasmodic Cholera Deobstruent Emollient Hepatic Laxative Malaria Sedative Vasodilator Women's complaintsDang Gui is a well-known Chinese herb that has been used in the treatment of female ailments for thousands of years. Its reputation is perhaps second only to ginseng (Panax ginseng) and it is particularly noted for its 'blood tonic' effects on women[218]. The root has a sweet pungent aroma that is very distinctive and it is often used in cooking, which is the best way to take it as a blood tonic[254]. One report says that the root contains vitamin B12 and can be used in the treatment of pernicious anaemia[176]. The root is alterative, analgesic, anti-cholesterolemic, anti-inflammatory, antispasmodic, deobstruent, emmenagogue, emollient, hepatic, laxative, sedative and peripheral vasodilator[165, 176, 218]. It is commonly used in the treatment of a wide range of women's complaints where it regulates the menstrual cycle and relieves period pain[218, 238, 254] and also to ensure a healthy pregnancy and easy delivery[218]. However conflicting information suggests it should not be used during pregnancy [301] and should not be used if menstrual flow is heavy or during menstration [301]. It is an ideal tonic for women with heavy menstruation who risk becoming anaemic[254]. The water-soluble and non-volatile elements of the root increase the contraction of the uterus whilst the volatile elements can relax the muscle of the uterus[176]. Its use prevents the decrease of liver glycogen and protects the liver[176]. Used for menopausal symptoms (hot flushes) [301]. It has an antibacterial action, inhibiting the growth of various bacteria including Bacillus dysenteriae, Bacillus typhi, B. comma, B. cholerae and haemolytic streptococci[176]. The root is an ingredient of 'Four Things Soup', the most widely used woman's tonic in China[254]. The other species used are Rehmannia glutinosa, Ligusticum wallichii

tolerant of poor soils than P. rhoeas[17]. Plants usually selfsow freely when growing in suitable conditions so long as the soil surface is disturbed[238]. When growing in cereal fields, poppies decrease the yields of nearby cereal plants[18, 20]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

#### 7.2.576 Paeonia obovata

6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fvifxre7t hionli

drutta Paeonia obovata is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Diuretic Febrifuge SedativeThe root is analgesic, antibacterial, anti-inflammatory, antispasmodic, diuretic, febrifuge and sedative[174]. The Chinese herb Chi Shao Yao is made from the whole root of a number of peony species, especially P. lactiflora, but also occasionally this species[250]. The most important ingredient medicinally in the root is paeoniflorin, which has been shown to have a strong antispasmodic effect on mammalian intestines, it also reduces blood pressure, reduces body temperature caused by fever and protects against stress ulcers[250]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - China, Japan, Korea, Siberia. ksacta Woods and thickets in mountains all over Japan[58]. Deciduous broad-leaved, mixed broad-leaved, and coniferous forests at elevations of 200 - 2800 metres in China[266].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta Requires a deep rich soil, preferably neutral or slightly alkaline[1], doing guite well in sun or light shade[200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Dislikes cold winds[233]. Grows well in light woodland[233]. Plants are hardy to about -20°c[187]. A very long-lived plant, living for 50 years or more in the garden[200]. This species is closely related to P. japonica[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

### 7.2.577 Geranium lucidum

Shining geranium

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli lwis hpa7tmwatli xre7t hjonli

drutta Geranium lucidum is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or

dwatta Astringent DiureticThe plant is diuretic and astringent[240]

nrakta Britain, Europe and N. Africa to the Himalayas. ksacta Shady rocks, walls and hedgebanks, on calcareous soils[17].

propta Seed - sow spring in situ.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Most members of this genus tolerate a wide range of soil types[200], though this species is said to require a calcareous soil[17]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

#### 7.2.578 Geranium wallichianum

6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Geranium wallichianum is a PERENNIAL growing to 0.3 m (1ft) by 1.5 m (5ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Dve TanninThe root contains 30% tannin, it is used as a dye[61]. A good dense ground cover plant[197, 200]. Plants should be spaced about 60cm apart each way[208].

dwatta Astringent Odontalgic Poultice StomachicThe plant has astringent properties[211]. A decoction of the root, mixed with the bark of Prunus cerasoides, is used in the treatment of peptic ulcers[272]. It has been used as a cure for toothache and has been applied externally to the eyes [145, 240]. The juice of the plant is applied to fresh cuts to stem the bleeding[272]. A paste of the plant is used as a poultice to relieve joint pains[272].

nrakta E. Asia - Himalayas from Afghanistan to Bhutan. ksacta Forests, shrubberies and open slopes, 2400 - 3600 me-

propta Seed - sow spring in a cold frame. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Prefers a position that is cool and moist in the summer but is not heavily shaded[187]. Plants are hardy to at least -20°c[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Some named forms have been selected for their ornamental value[187].

#### 7.2.579 Coronilla scorpioides

1269

Annual Scorpion Vetch, Yellow crownvetch 6 tlin 9 cvuc 0 kcak 0 tcan 1 dwat 0.4 m hkuc htut cyutli tcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli

drutta Coronilla scorpioides is a ANNUAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate maritime exposure.

dwatta Cardiac StomachicCardiac, stomachic[61].

nrakta S. Africa - Natal and N. Cape province. ksacta Grassy and rocky places, often amongst bracken, and in moist peaty soil at low elevations[187].

propta Seed - best sown in a greenhouse as soon as it is ripe[200], it can also be sown in a greenhouse in March/April[133]. The seed usually germinates in 1 - 3 months at 18°c[133], do not sow it too thickly so that it is possible to grow the seedlings on in their pot without disturbing them for their first year of growth. Give occasional liquid feeds to make sure they do not become nutrient deficient. Divide the seedlings up into individual pots in the spring following germination, grow them on for a further year in the greenhouse and then plant them out into their permanent positions in late spring or early summer. Seedlings take 2 - 3 years to flower[133]. Division of offsets in April/May. Do not move plants between October and March[175]. Division is very easy in the growing season, the divisions can be planed straight out into their permanent positions if required.

nwatta Succeeds in most soils[175] but it prefers a light very well-drained porous soil with plenty of leaf-mould[200]. Requires plenty of moisture during the growing season but it needs to be kept dry in the winter[1, 200]. Another report says that it is drought resistant when established[190]. It only flowers freely when growing in a very sunny position[175]. Plants succeed in maritime gardens[233]. The rhizomes are best planted only just below soil level - a mulch of gravel or stone chips will help to keep the crown of the plant free from excess moisture[282]. Plants are probably hardy to about -15°c[187], but are best if given a good mulch should temperatures lower than -5°c occur[200]. Some plants growing in Essex have their leaves killed by the first frosts of the autumn but the clumps are unharmed[190]. Hybridizes very freely with other members of this genus - some botanists say there is only one very variable species of Agapanthus[200]. A number of named varieties have been selected for their ornamental value[187]. Plants seem to be immune to the predations of rabbits[233]. The flowering stems lean towards the sun[175].

# 7.2.574 Colchicum autumnale

Autumn Crocus, Meadow Saffron, 6 tlin 9 cvuc 0 kcak 0 tcan 3 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Colchicum autumnale is a BULB growing to 0.2 m (Oft 8in) by 0.2 m (Oft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf from February to July, in flower from August to October, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is selffertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista All parts of the plant, but especially the bulb[200], are poisonous[4, 7, 10, 19, 65]. They cause vomiting, violent purging, serious inflammation of the stomach and bowels. and death[232]. Handling the corms can cause skin allergies in some people[238].

tcanta Plant breedingThe poisonous alkaloid 'colchicine' is extracted from this plant and used to alter the genetic make-up of plants in an attempt to find new, improved varieties[9, 13, 19, 46, 100, 171]. It works by doubling the chromosome number[89].

dwatta Analgesic Antirheumatic Cathartic Emetic HomeopathyThough known since at least the time of the ancient Greeks, autumn crocus was considered too poisonous to use medicinally and it was not until research in the Eighteenth century that the plant was discovered to be of value in the treatment of gout[268]. In modern herbalism it is still used to relieve the pain and inflammation of acute gout and

rheumatism, although frequent use has been known to encourage more frequent attacks of the complaint[232, 268]. Both the corm and the seeds are analgesic, antirheumatic, cathartic and emetic[4, 7, 13, 21, 235]. They are used mainly in the treatment of gouty and rheumatic complaints, usually accompanied with an alkaline diuretic[4]. Leukaemia has been successfully treated with autumn crocus, and the plant has also been used with some success to treat Bechet's syndrome, a chronic disease marked by recurring ulcers and leukaemia[254]. A very toxic plant, it should not be prescribed for pregnant women or patients with kidney disease, and should only be used under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. The seeds are harvested in early summer, the corms in mid to late summer when the plant has fully died down. They are dried for later use[238]. The fresh bulb is used to make a homeopathic remedy[232]. It is used in the treatment of nausea, diarrhoea and rheumatism[232].

nrakta Central and southeastern Europe, including Britain, from Denmark to Spain, east to Macedonia. ksacta Meadows and damp woodland clearings[1, 10, 13] on calcareous and neutral soils[17]. Extremely rare away from the Bristol Channel in Britain[7].

propta Seed - best sown as soon as it is ripe in early summer in a seed bed or a cold frame[1, 164]. Germination can be very slow, taking up to 18 months at 15°c[164]. It is best to sow the seed thinly so that it is not necessary to transplant the seedlings for their first year of growth. Apply a liquid fertilizer during their first summer, however, to ensure they get sufficient nourishment. Prick out the seedlings once they are dormant, putting perhaps 2 plants per pot, and grow them on in a greenhouse or frame for at least a couple of years. Plant them out into their permanent positions when they are dormant[K]. The seedlings take 4 - 5 years to reach flowering size[1]. Division of the bulbs in June/July when the leaves have died down[1]. Larger bulbs can be planted out direct into their permanent positions, though it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out. The plant can be divided every other year if a quick increase is required[1].

nwatta Landscape Uses: Alpine garden, Border, Foundation, Massing, Rock garden, Specimen. Prefers a rich welldrained loam in a sunny position[1, 188]. Tolerates partial shade but dislikes dry soils[1]. Tolerates a pH in the range 4.5 to 7.5. Plants are hardy to about -20°c[200]. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least -5°c[214]. The autumn crocus is easily grown in grass[90] and can be naturalized there[200]. It also grows well amongst shrubs and by woodland edges[28]. Plant the corms about 7 - 10cm deep in July[1]. Plants seem to be immune to the predations of rabbits[233], though slugs may attack the corms[238]. The flowers are very attractive to bees and butterflies[201]. Special Features:Not North American native, Naturalizing, Suitable for cut flowers.

### 7.2.575 Papaver dubium

Long-Head Poppy, Blindeves 6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.5 m hkuc htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Papaver dubium is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista This plant is toxic to mammals, though the toxicity is low[76]. The seed is not toxic[76].

dwatta DiaphoreticThe plant is sudorific[240].

nrakta Central and southern Europe, including Britain. ksacta A weed of arable fields, especially amongst cereal crops, and of waste places[17].

propta Seed - sow spring in situ[200].

nwatta Prefers a well-drained sandy loam in a sunny position[1, 200]. Does not do well on wet clay soils but succeeds in most other soils[115]. This species is possibly more and Paeonia lactiflora[254]. The root is harvested in the autumn or winter and dried for later use[254, 283]. It has been used to treat pulmonary hypertension in combination with the allopathic medication nifedipine [301]. Other uses include: constipation (a laxative), trauma injuries, ulcers, rheumatism and malaria [301].

nrakta E. Asia - China. ksacta High ground in cool and damp areas of western and north-western China[165]. Forests[266]

propta Seed - best sown in a cold frame as soon as it is ripe since the seed only has a short viability[200]. Seed can also be sown in the spring, though germination rates will be lower. It requires light for germination[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for their first winter, planting them out into their permanent positions in the spring. The seed can also be sow in situ as soon as it is ripe.

nwatta Requires a deep moist fertile soil in dappled shade or full sun[200]. This species is not fully hardy in the colder areas of the country, tolerating temperatures down to at least -5°c[238]. Plants are reliably perennial if they are prevented from setting seed[200].

# 7.2.524 Datura stramonium

Thorn Apple, Jimsonweed, Jamestown Weed 6 tlin 9 cyuc 0 kcak 1 tcan 4 dwat 1.5 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli xre7t hionli

drutta Datura stramonium is a ANNUAL growing to 1.5 m (5ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Moths. Suitable for: light (sandy) and medium (loamy) soils and prefers welldrained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist

pcista All members of this genus contain narcotics and are very poisonous, even in small doses[200].

tcanta Hair RepellentThe growing plant is said to protect neighbouring plants from insects[18, 20]. The juice of the fruits is applied to the scalp to cure dandruff and falling hair[243]. There has also been considerable interest in the use of extracts of Datura species as botanical pesticides. D. metel, for example, appears to suppress a number of nematode species of economic importance. Landscape Uses: Border, Container, Foundation, Specimen.

dwatta Anodyne Anthelmintic Antiasthmatic Antidandruff Antiinflammatory Antispasmodic Hallucinogenic Hypnotic Mydriatic NarcoticThe thornapple is a bitter narcotic plant that relieves pain and encourages healing[238]. It has a long history of use as a herbal medicine, though it is very poisonous and should be used with extreme caution. The leaves, flowering tops and seeds are anodyne, antiasthmatic, antispasmodic, hallucinogenic, hypnotic, mydriatic and narcotic[1, 4, 7, 9, 13, 21, 46, 165, 238, 240]. The seeds are the most active medicinally[4]. The plant is used internally in the treatment of asthma and Parkinson's disease, excess causes giddiness, dry mouth, hallucinations and coma[238]. Externally, it is used as a poultice or wash in the treatment of fistulas, abscesses wounds and severe neuralgia[238, 257]. The use of this plant is subject to legal restrictions in some countries[238]. It should be used with extreme caution and only under the supervision of a qualified practitioner since all parts of the plant are very poisonous and the difference between a medicinal dose and a toxic dose is very small[21, 213, 238]. The leaves should be harvested when the plant is in full flower, they are then dried for later use[4]. The leaves can be used as a very powerful mind-altering drug, they contain hyoscyamine and atropine[213]. There are also traces of scopolamine, a potent cholinergic-blocking hallucinogen, which has been used to calm schizoid patients[213]. Atropine dilates the pupils and is used in eve surgery[222]. The leaves have been smoked as an antispasmodic in the treatment for asthma, though this practice is extremely dangerous[213, 222]. The seeds are used in Tibetan medicine, they are said to have a bitter and acrid taste with a cooling and very poisonous potency[241]. Analgesic, anthelmintic and anti-inflammatory, they are used in the treatment of stomach

and intestinal pain due to worm infestation, toothache and fever from inflammations[241]. The juice of the fruit is applied to the scalp to treat dandruff[243].

nrakta Original habitat is obscure, it is found in many areas of the world, occasionally in S. Britain[17]. ksacta Dry waste ground and amongst rubble or the ruins of old build-

propta Sow the seed in individual pots in early spring in a greenhouse[200]. Put 3 or 4 seeds in each pot and thin if necessary to the best plant. The seed usually germinates in 3 - 6 weeks at 15°c. Plant out in late spring or early summer, after the last expected frosts. Especially in areas with hot summers, it is worthwhile trying a sowing outdoors in situ in mid to late spring.

nwatta Landscape Uses: Border, Container, Foundation, Specimen. Succeeds in most moderately good soils but prefers a rich light sandy soil or a calcareous loam, and an open sunny position[1, 4, 200]. Plants often self-sow when well sited[1]. The thornapple is cultivated commercially as a medicinal plant[57]. It can become a weed in suitable conditions and is subject to statutory control in some countries[238]. This species is extremely susceptible to the various viruses that afflict the potato family (Solanaceae), it can act as a centre of infection so should not be grown near potatoes or tomatoes[200]. Grows well with pumpkins[20]. The whole plant gives off a nauseating stench[245]. Special Features: North American native, Naturalizing, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

# 7.2.525 Hebe speciosa

New Zealand hehe

6 tlin 9 cvuc 0 kcak 2 tcan 0 dwat 1.5 m hkuc

htut cyutli tcup hwicli hyishrasilut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Hebe speciosa is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

tcanta Hedge Hedge Succeeds as an untrimmed hedge in maritime areas, tolerating maritime exposure[75, 200]. At-

nrakta New Zealand. ksacta Sea cliffs on North Island[44]. Locally naturalized on sea cliffs in Ireland[50].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in spring. Only just cover the seed and do not allow the compost to dry out. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the young plants for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts. It would probably be worthwhile giving some protection to the plant for its first winter outdoors. Cuttings of half ripe wood, 3 - 5cm with a heel, July/August in a frame. Pot up when roots are forming and keep in a frame or greenhouse for its first winter before planting out in late spring. Cuttings of mature wood, late autumn or winter in a frame.

nwatta Succeeds in most soils so long as they are not boggy or too dry[182]. Prefers a light well-drained soil[1, 166] and a sunny position[200]. Prefers a moist rich soil[166] but plants are probably hardier in a soil that is on the poor side[1]. Lime tolerant[11]. Intolerant of drought[166]. Tolerates atmospheric pollution[200]. Very wind resistant, withstanding maritime exposure[166]. Very ornamental[1]. A good butterfly plant[30]. A polymorphic species[200[, it hybridizes freely with other members of this genus. Plants in this genus are notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is clumping, giving the plant a clumping habit. The predictable growth be-

haviour makes it easier to maintain without having to apply containment methods[2-1].

# 7.2.526 Ceratostigma willmottianum

Chinese Plumbago, Chinese Leadwort 6 tlin 9 cvuc 0 kcak 0 tcan 1 dwat 1 m hkuc

6 tiin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m nkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Ceratostigma willmottianum is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta BachThe plant is used in Bach flower remedies the keywords for prescribing it are 'Distrust of self', 'Doubt of one's ability' and 'Foolishness' [209].

nrakta E. Asia - W. China to Tibet. ksacta Warm valleys at forest edges or in thickets; 700–3500 m. Gansu (Wen Xian), W Guizhou, S and W Sichuan, SE Xizang, E and N Yunnan[266].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of rooted suckers in the spring[200]. Layering in the spring. Plants often self-layer[200]. Cuttings of half-ripe wood in a closed frame[200]. Plants should be overwintered in a frost-free frame or greenhouse for their first winter[200].

nwatta Landscape Uses:Border, Foundation, Prefers a light moderately fertile and retentive soil with good drainage, though it tolerates poor dry soils[200] and grows well on chalk[11]. Requires a sunny position[11, 200]. Plants are not fully hardy in Britain, especially if treated as shrubs, but if treated as herbaceous perennials they succeed outdoors in areas where winter temperatures do not fall below about -10 to -15°c[200]. When the woody stems survive the winter it is best to prune them hard in the spring in order to obtain better flowering[11]. Plants flower best on the current years growth[200]. Most, if not all the plants in cultivation in Britain, derive from an original two plants raised from seed in 1908[11]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Blooms are very showy.

# 7.2.527 Ferula persica

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ferula persica is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

tcanta GumThe gum 'Sagapenum' is obtained from the plant (from the root?). It is used in the treatment of rheumatism and lumbago[46, 61, 64].

dwatta AntirheumaticAntirheumatic[46, 61, 64]. It is used in the treatment of rheumatism and backache[254].

nrakta W. Asia - Iran. ksacta Dry slopes to 2000 metres[74]

propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their

permanent positions whilst still small because the plants dislike root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root disturbance.

nwatta Succeeds in most soils[1]. Requires a deep fertile soil in a sunny position[200]. Plants have a long taproot and are intolerant of root disturbance[200]. They should be planted into their final positions as soon as possible.

### 7.2.528 Swertia chirayita

Chiretta

6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 1 m hkuc hmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Swertia chirayita is a ANNUAL growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness, It is hardy to UK zone 7. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

pcista Do not exceed recommended dose.

dwatta Digestive Hepatic Malaria StimulantChiretta is a traditional Ayurvedic herb. A strongly bitter tonic it is an excellent remedy for a weak stomach, especially when this gives rise to nausea, indigestion and bloating, and it has also been shown to protect the liver[254]. It is perhaps best known in India as the main ingredient in mahasudarshana churna, a remedy containing more than 50 herbs[254]. The plant has an interesting chemistry, similar in many respects to Gentiana lutea, a widely used restorative tonic of the digestive system[238]. It also contains xanthones, which are reputedly effective against malaria and tuberculosis, and also amarogentin, a glycoside that may protect the liver against carbon tetrachloride poisoning[238]. The whole plant is an extremely bitter tonic digestive herb that lowers fevers and is stimulant[165, 238]. The herb has a beneficial effect on the liver, promoting the flow of bile, it also cures constipation and is useful for treating dyspensia [4, 238]. The plant is harvested when the seed is setting and then dried for later

nrakta E. Asia - Himalayas. ksacta Pastures and slopes in the Himalayas to 3,000 metres[238, 240].

propta Seed - sow spring in temperatures not exceeding  $10^{\circ}c$  in a humus-rich medium[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer.

nwatta Succeeds in a moist humus-rich soil in damp light woodlands, streamsides or the bog garden[200]. Grows best in areas with cool summers[200]. Succeeds in full sun or partial shade[238]. Plants are hardy to at least -15°c[238].

## 7.2.529 Daphne laureola

Spurge Laurel

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc

pcimhmim cyutli kyuctcup hwicli jlutnyik hpa7tli flatprik

drutta Daphne laureola is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from February to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil.

pcista All parts of the plant are poisonous[200]. Skin contact with the sap can cause dermatitis in some people[65, 200]

dwatta Abortifacient Cancer Emetic Emmenagogue PurgativeThe leaves have been used as an emmenagogue, though they can cause purging and vomiting[4]. Both the leaves and the bark have been used to procure abortions[4]. The plant contains various toxic compounds and these are tcanta A good ground cover for shady positions[200]. dwatta Appetizer Cardiotonic VulneraryThe root is ap-

dwatta Appetizer Cardiotonic Vulnerary Ine root is appetizer, cardiotonic and vulnerary [178, 218]. Strengthens the memory [178, 218].

nrakta E. Asia - China, Japan. ksacta Woods and foothills of C. and S. Japan[58]. Dense forests, shady and moist slopes, hillsides along valleys at elevations of 100 - 3200 metres in China[266].

propta Seed - we have no information on this species but suggest sowing the seed as soon as it is ripe in a cold frame if this is possible. Stored seed is likely to be slow to germinate and might take a year or more. Sow it in a cold frame as soon as it is received. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Divide in early spring.

nwatta Succeeds in most soils[1], preferring one that is rich in humus and a position in semi-shade[233]. An attractive shade tolerant ground cover plant for neutral or acidic soils[200]. Plants seldom flower well in areas such as Britain with cool summers, they need warm dry conditions in late summer in order to ripen well and initiate flower production[200].

# 7.2.570 Goodyera pubescens

Downy Rattlesnake Plantain

6 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 0.4 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Goodyera pubescens is an evergreen Perennial growing to 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist soil.

dwatta Appetizer Miscellany Odontalgic Ophthalmic PoulticeA tea made from the roots is used in the treatment of pleurisy and snakebites[222]. A tea made from the leaves is taken to improve the appetite, as a treatment for colds, kidney ailments, rheumatism and toothaches[222, 257]. Externally, a poultice of the wilted leaves is used to cool burns, treat skin ulcers and relieve rheumatic joints[222, 257]. An ooze from the plant (this probably means the sap or the juice of the bulb[K]) has been used as eye drops to treat sore eyes[257].

nrakta Eastern N. America - Maine to Florida, west to Alberta and Quebec. ksacta Almost any wooded habitat with acid soils, mainly on moist humus soils in shady, upland woods of hemlock, pine, oak, or maple, less frequent in low-land woods, bogs, swamps; 0 -1600 metres[270].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move.

nwatta Landscape Uses:Border, Ground cover, Massing. Requires a somewhat shady site and a well-drained compost of peat, leafmold and sand[1]. Does well in the woodland garden[42, 230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This species is closely related to the British native species, G. repens[230]. This plant is too rare

in the wild to be harvested[222]. Special Features: Attractive foliage, North American native, Attractive flowers or blooms.

# 7.2.571 Geranium rotundifolium

Roundleaf geranium

6 tlin 9 cvuc 0 kcak 0 tcan 1 dwat 0.4 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Geranium rotundifolium is a ANNUAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

dwatta Astringent DiureticThe plant is used as an astringent and diuretic[240].

nrakta Britain to E. Asia - Himalayas. ksacta Hedgebanks, wall tops etc[17].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Succeeds in any moderately fertile retentive soil in a sunny position[2001. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

# 7.2.572 Xanthium spinosum

Spiny Cocklebur

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.5 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fvif hionli

drutta Xanthium spinosum is a ANNUAL growing to  $0.5 \, \mathrm{m}$  (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to October, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Poisonous[65, 76]. Most members of this genus are toxic to grazing animals and are usually avoided by them[222]. The seed also contains toxins[222].

dwatta Emetic Miscellany StypticThe whole plant is an active styptic for both local and general application[4]. It is said to be a valuable and sure specific in the treatment of hydrophobia[4]. The plant is also diaphoretic, diuretic and sedative[61]. An infusion of the root has been used as an emetic[257].

nrakta S. America. A locally established casual in Britain[17]. ksacta Naturalized in waste ground in N. America[235].

propta Seed - sow spring in situ. The seed requires plenty of moisture in order to germinate.

nwatta An easily grown plant, it succeeds in most soils but requires a sunny position. Plants often self sow.

# 7.2.573 Agapanthus campanulatus

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Agapanthus campanulatus is an evergreen Bulb growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender it is in leaf all year, in flower from July to September. The species is hermaphrodite (has both male and female organs)

conditions[254]. The leaf is discutient and vulnerary[218]. The flowers are antibacterial, carminative, cholagogue, de-obstruent, depurative, diuretic, expectorant, laxative, stomachic and tonic[218]. They are used internally in the treatment of bronchial complaints with profuse phlegm, nausea and vomiting, hiccups and flatulence[176, 238]. The flowers have an antibacterial action, but this can be destroyed by proteins in the body[176]. The plant is harvested when in flower and can be dried for later use[254]. The root is discutient, resolvent and vulnerary[218]. The plant has been mentioned as a possible treatment for cancer of the oesophagus[218].

nrakta Europe to E. Asia. Formerly naturalized in Britain, but probably now extinct there[17]. ksacta Moist meadows, streamsides, ditches, wet woods etc[17].

propta Seed - sow spring or autumn in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. If you have sufficient seed, it is worthwhile trying a sowing in situ in the spring or the autumn. Division in spring or autumn[111].

nwatta Succeeds in a sunny position in any moderately fertile well-drained soil[200]. Grows well in heavy clay soils. Plants are hardy to at least -15°c[238]. The sub-species I. britannica chinensis is the form used medicinally[238].

# 7.2.566 Halenia elliptica

Spurred Gentian

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta Halenia elliptica is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

dwatta The entire plant is used in Tibetan medicine, it is considered to have a bitter taste and a cooling potency[241]. It is cholagogue and febrifuge[241]. It is used in the treatment of liver inflammations, stomach complaints and fevers from contaminus diseases[241]

nrakta E. Asia - Himalayas from India to China. ksacta Beside streams in valleys, grassland slopes, scrub, forest margins and forests at elevations of 700 - 4,100 metres[266].

propta Seed - best sown in early spring in a cool greenhouse[200]. Only just cover the seed. Prick out into individual pots once the plants are large enough to handle and plant out in late spring after the last expected frosts.

nwatta Requires a cool, damp soil with a pH of 5- 6, and a position in light shade with protection from strong winds[200]. Plants are not very hardy outdoors in this country and are best treated as frost-tender annuals[200].

# 7.2.567 Lysimachia paridiformis

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Lysimachia paridiformis is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

dwatta Anodyne Antitussive Blood tonic Carminative ExpectorantThe flowering tops, simmered in water, are carminative and diaphoretic[147, 218]. The whole plant is anodyne, antitussive, blood tonic, carminative and expectorant[147, 218]. A decoction is used in the treatment of pulmonary tuberculosis, 'wind-cold' coughing, rheumatoid arthritis, traumatic injuries, stomach ache, enteritis, snake bites and abscess swelling[147]. The fresh herb is also crushed and applied externally as a poultice[147].

nrakta E. Asia - W. China. ksacta Hillsides, stream edges, damp and wet places beneath forest trees[147]. Damp areas in forests, mountain valleys and wet ravines at elevations of 500 - 1400 metres[266].

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn[200]. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta An easily grown plant, succeeding in a moist loamy soil[1]. Judging by its native habitat, it should succeed in shallow water. Grows well in heavy clay soils. Most species in this genus seem to be immune to the predations of rabbits[233].

### 7.2.568 Cyclamen hederifolium

Cyclamen, Alpine Violet, Persian Violet 6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.1 m hkuc pcimhmimhtut cyulli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Cyclamen hederifolium is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.2 m (0ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf from October to June, in flower from July to November, and the seeds ripen from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Poisonous.

tcanta Plants can be used as a ground cover, though they will need to be given a mulch of leaf mould in order to keep the weeds at bay when they are dormant in the summer[208].

dwatta Homeopathy PurgativeThe fresh rootstock is a drastic purgative. It should be used with extreme caution[4, 21, 46]. A homeopathic remedy is made from the fresh root[4]. It is applied externally to the bowels to cause purging[4].

nrakta S. Europe. Naturalized in Britain[17]. ksacta Shady woodlands, usually on limestone[28, 31, 89].

propta Seed - best sown as soon as it is ripe in a cold frame[133, 134]. Fresh seed germinates in 3 - 6 weeks[133]. Pre-soak stored seed for 24 hours in warm water, sow shallowly and keep in a shady position at 15°c[124]. Germination may be slow and erratic[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a shady position in the greenhouse for at least their first winter. Plant them out into their permanent positions in the summer. Division in April/May. Very easy, the larger tubers can be planted out straight into their permanent positions whilst it is best to pot up the smaller ones and grow them on for a season before planting them out.

nwatta Landscape Uses:Border, Container, Rock garden. Prefers a cool habitat and a well-drained humus rich soil[13]. Easily grown in a stony leafy soil in sun or shade[90]. Thrives in the light shade of trees. Tolerates a pH between 5.5 and 8[200]. This species is hardy to about -18°c[200]. A very ornamental plant[1]. Plants seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, Not North American native, Suitable for cut flowers.

#### 7.2.569 Reineckia carnea

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.1 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Reineckia carnea is an evergreen Perennial growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in April. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

currently being investigated (1995) for anti-leukaemia effects[238].

nrakta Western and southern Europe, from Britain and Belgium to Spain and Macedonia, N. Africa, W. Asia. ksacta Woods, mainly on calcareous soils, where it is widespread and rather common[17].

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°c followed by 12 - 14 weeks at 3°c. Germination may still take another 12 months or more at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a moist soil and a position in semi-shade, growing well in woodlands[11]. Plants are often found growing in dense shade in the wild[245]. A good sandy loam suits most members of this genus[11]. Flowers are produced towards the ends of the previous year's growth[11]. They are sweetly scented[245]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188].

# 7.2.530 Begonia grandis evansiana

Hardy Begonia

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Begonia grandis evansiana is a PERENNIAL growing to 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from July to August, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

tcanta This species can be grown as a ground cover in a sunny position sheltered by shrubs. The plants form spreading clumps[208].

dwatta Anodyne Antiphlogistic AntispasmodicThe tuberous roots and fruits are anodyne, antiphlogistic and antispasmodic. Stimulates blood circulation[147]. A decoction is used in the treatment of traumatic pain, haematemesis, gonorrhoea, post-partum vaginal discharge, amenorrhoea and snakebites[147].

nrakta E. Asia - China, Japan, Himalayas(Malaya). ksacta Shady slopes or wet places[147]. In moist rocky wall of valley, in dense forests of valley by streams as wall as on rocks by streams or under shrubberies of valley; 100 - 1100 metres[266].

propta Seed - surface sow in a greenhouse and keep the compost moist in a light position. The seed can be very slow to germinate, sometimes taking a year or more[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division. Basal cuttings from tubers in spring. Bulblets, formed in the leaf axils. Harvest in the autumn and store overwinter in a cool frost-free place, plant out in spring[200].

nwatta Landscape Uses:Border, Container, Foundation, Massing, Specimen, Woodland garden. Requires a well-drained soil[200]. Does not require high light intensities[200], succeeding in full sun or partial shade[233]. Prefers a pH between 6 and 7[200]. Plants tolerate temperatures down to about -5°c, and can be grown outdoors in the milder areas of the country if given the shelter of a wall[200]. This same report gives the plant a hardiness zone rating of 6 (tolerating temperatures down to about -20°c)[200]. Grows well outdoors in Cornwall amongst trees and shrubs[166].

There are some named varieties selected for their ornamental value[200]. Special Features: Attractive foliage, Naturalizing, Fragrant flowers.

# 7.2.531 Delphinium denudatum

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Delphinium denudatum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista All parts of the plant are toxic[172]. The plant is most toxic when it is young[200].

tcanta ParasiticideA parasiticide is obtained from the leaves[172]. It is quite toxic and so is for external use only.

dwatta Alterative Bitter Odontalgic Parasiticide Stimulant TonicThe roots are alterative, bitter, stimulant and tonic[240]. A paste of the rot is used in the treatment of toothache, and also as an adulterant for aconite (from Aconitum spp.)[240, 272].

nrakta E. Asia - Himalayas. ksacta Dry scrubby slopes and forest clearings, 1700 - 2300 metres[145].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°c[200]. Temperatures above 15°c inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Succeeds in most soils so long as they are rich and well-drained[200]. Intolerant of winter-wet soils[200]. Requires an open sunny position[188]. This plant is adored by slugs[175]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

#### 7.2.532 Phlomis umbrosa

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phlomis umbrosa is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta Haemostatic HepaticThe root contains several medially active compounds and has been shown to exert a protective influence on the liver[279]. It is used as a haemostatic in Korea and in treating tineapedis[279].

nrakta E. Asia - northern China, Korea. ksacta Forests, grassy slopes, streamsides, thickets and wet areas at elevations of 700 - 3200 metres in China[266].

propta Seed - sow spring in a greenhouse and only just cover the seed. The seed germinates quickly, prick out the seedlings into individual pots when they are large enough to handle and grow them on for their first year in a greenhouse. Plant them out in early summer. Division of the tubers in spring or autumn[200]. Be careful not to damage the tubers[200]. If dividing in the autumn, it is best to store the tubers in a cool but frost-free place over the winter, planting them out in the spring. Spring divisions can be planted out straight away into their permanent positions.

nwatta Requires a well-drained soil in full sun with shelter from cold winds[200]. Plants are hardy to at least - 5°c[200], probably more. A variable species, there are several sub-species[266].

### 7.2.533 Cardiocrinum giganteum

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1.8 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cardiocrinum giganteum is a BULB growing to 1.8 m (6ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland). It prefers moist soil.

tcanta MusicalA kind of flute is made from the hollow stems[272].

dwatta PoulticeThe leaves are used as an external cooling application to alleviate the pains of wounds and bruises[240]. A paste of the root is applied as a poultice to treat dislocated bones[272].

nrakta E. Asia - Himalayas from Nepal to Assam and Sikkim. ksacta Woodland clearings at an altitude of 1,500 - 2,400 metres and as high as 3,600 metres around Simla[245].

propta Seed - best sown as soon as it is ripe in a cold frame in the autumn. The plant has delayed epigeal germination and will often germinate in the spring but can take up to 2 years especially if the seed is stored prior to being sown[134]. An alternative is to mix the seed with some moist leafmould and seal it in a plastic bag. Keep this at a temperature of  $20^{\circ}\mathrm{c}$  for 3 weeks then pot up any seed that germinates and place the rest in a fridge for 4-5 weeks at 3-5 °c before sowing in a warm place[138]. Seedlings should be grown on in pots in a shaded position in a cold frame or greenhouse for 3-4 years before planting them out in their permanent positions[138]. Bulblets are obtained from the base of the old plant after flowering. Pot up and plant out when well established.

nwatta Prefers a moist well-drained position in shade and a soil that is rich in leafmould[47, 200]. Requires a deep, very fertile humus-laden soil[233]. Prefers growing in woodland conditions[42, 200]. A monocarpic plant, the bulb takes about 7 years to reach flowering size but then dies after flowering. However, it produces a number of new bulblets at the base and can be propagated by these[47, 200]. These bulblets take 3 - 5 years to flower[200]. The flowers scent the surrounding area with their rich sweet perfume[245]. When planting, only just cover the bulb with leafmould[47]. The bulb is very attractive to slugs, mice and voles and may require protection[200]. Plants seem to be immune to the predations of rabbits[233].

### 7.2.534 Hypericum patulum

Goldencup St. Johnswort

6 tlin 7 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

drutta Hypericum patulum is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is polinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Hedge Hedge WoodPlants are sometimes grown as a hedge[146]. Wood - close grained, moderately hard[146].

dwatta Aromatic StimulantThe seeds are aromatic and stimulant[240].

nrakta E. Asia - W. China, Japan, Himalayas. ksacta Shady ravines, sometimes on rocks[158]. Open hillsides, 1500 - 2400 metres in the Himalayas[146].

propta Seed - sow spring in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 3 months at 10°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into

their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10-12 cm with a heel, July/August in a frame. Plant out in the following spring[200]. Cuttings of mature wood, 12-17cm with a heel, October/November in a sheltered position outdoors. Plants root by the spring. Good percentage[78].

nwatta Landscape Üses:Container, Ground cover, Massing, Rock garden. Easily grown in any reasonably good well-drained but moisture retentive soil[1]. Succeeds in sun or semi-shade but flowers better in a sunny position[200]. This species is only hardy to about -5°c but plants can resprout from the base if they are cut back by cold[184]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Attractive flowers or blooms.

# 7.2.535 Thalictrum simplex galioides

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Thalictrum simplex galioides is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no records of toxicity have been found for this plant, it belongs to a family that includes many poisonous plants so some caution is advised.

dwatta DiureticDiuretic[61].

nrakta S.E. and C. Europe. ksacta Not known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[K]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. The seed can also be sown in an outdoor seedbed in spring[111]. Plant them into their permanent positions the following spring. Division in spring as new growth commences or in the autumn[111]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Succeeds in most fairly good soils in sun or semishade[1, 111]. Members of this genus are rarely if ever troubled by browsing deer[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. This species is closely related to T. lucidum[200].

### 7.2.536 Geranium pusillum

Small geranium

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 1 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Geranium pusillum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta Anodyne Astringent VulneraryThe plant is used as an anodyne, astringent and vulnerary[240].

nrakta Britain to E. Asia - Himalayas. ksacta Cultivated and waste ground and open habitats in dry grassland[17].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging

#### 7.2.563 Rhus toxicodendron

Eastern Poison Oak

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Rhus toxicodendron is a deciduous Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to June, and the seeds ripen from September to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista This plant contains toxic substances and skin contact with it can cause severe irritation to some people[11]. The sap is extremely poisonous[11]. The sap contains 3-N pentadecycatechnol. Many people are exceedingly sensitive to this, it causes a severe spreading dermatitis. The toxins only reach the skin if the plant tissues have been damaged, but even indirect contact can cause severe problems[200].

tcanta Dye Ink Mordant Oil Parasiticide Tannin VarnishThe leaves are rich in tannin. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. An oil is extracted from the seeds[4]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The milky juice makes an excellent indelible marking ink for linen etc[4, 11]. It is also used as a varnish for boots and shoes[4].

dwatta Antirheumatic Homeopathy Irritant Narcotic Parasiticide Rubefacient Salve StimulantPoison oak has occasionally been used medicinally, though it is an extremely poisonous plant and great caution should be exercised. Any herbal use should only be undertaken under the supervision of a qualified practitioner. See also the notes above on toxicity. A fluid extract of the fresh leaves is irritant, narcotic, rubefacient and stimulant[4]. It has been used with some success in the treatment of paralysis, obstinate herpatic eruptions, palsy and in various forms of chronic and obstinate eruptive diseases[4]. A mash of the leaves has been used to treat ringworm[213]. An external application has also been used in the treatment of herpes sores[213]. A poultice of the plant has been used to treat infectious sores on the lips[257]. The root has been used to make a poultice and salve in the treatment of chronic sores and swollen glands[257]. A homeopathic remedy is made from the fresh leaves[232]. These should be harvested of a night-time, during damp weather and before the plant flowers[232]. This remedy has a wide range of applications and is one of the main treatments for mumps[232], it is also used in a wide range of skin disorders[4].

nrakta South-eastern N. America - New Jersey to Delaware, south to Georgia, Alabama and Texas. ksacta Dry barrens, pinelands and sands[43].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to sowing in order to leach out any germination inhibitors[200]. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 2001. Suckers in late autumn to winter[2001.

nwatta Succeeds in a well-drained fertile soil in full sun[11, 200]. Judging by the plants natural habitat, it should also succeed in poor acid soils and dry soils[K]. The young growth in spring can be damaged by late frosts. Plants have brittle branches and these can be broken off in strong winds[200]. Plants are also susceptible to coral spot fungus[11]. Plants in this genus are notably resistant to honey fungus[200]. This species is a small suckering shrub, it can

spread freely in suitable conditions[K]. There is some confusion over the correct name of this species. It is united with R. radicans (under that name) by some botanists whilst others split this species off into another genus, Toxicodendron, and unite it with R. radicans as Toxicodendron radicans[200]. Many of the species in this genus, including this one, are highly toxic and can also cause severe irritation to the skin of some people, whilst other species are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus, Toxicodendron, by some botanists[200]. Dioecious. Male and female plants must be grown if seed is required.

### 7.2.564 Asarum blumei

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.2 m hkuc

pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Asarum blumei is an evergreen Perennial growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista Although no reports of toxicity have been found for this plant, at least 3 other members of this genus have reports that the leaves are toxic[7, 19]. Some caution is therefore advised in the use of this plant.

dwatta Analgesic Antitussive Carminative ExpectorantA decoction of the root is analgesic, antitussive, carminative, expectorant and antitussive[147, 174, 218]. It is used in the treatment of sore throats[174].

nrakta E. Asia - China, Japan ksacta Damp shady spots on mountain sides[147].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°c[200]. The flowers are malodorous and are pollinated by flies[200]. Plants often self-sow when growing in a suitable position[200].

#### 7.2.565 Inula britannica

Xuan Fu Hua. British vellowhead

6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 0.8 m hkuc

htut cyutli tcuphja7n hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Inula britannica is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

dwatta Antibacterial Antiemetic Cancer Carminative Cholagogue Deobstruent Depurative Diuretic Expectorant Laxative Resolvent Stomachic Tonic VulneraryXuan Fu Hua is used in Chinese herbalism as a mildly warming expectorant remedy and it is especially suitable where phlegm has accumulated in the chest[254]. The flowers are more commonly used, but the leaves are also used, generally for less serious

and antispasmodic effect makes it a valuable treatment for the symptoms of Parkinson's disease, relieving tremor and rigidity during the early stages of the disease[254]. This species is generally considered the best for internal use, whilst the black henbane (H. niger) is the form most used externally[4]. All parts of the plant, but especially the leaves and the seeds, can be used - they are anodyne, antispasmodic, mildly diuretic, hallucinogenic, hypnotic, mydriatic, narcotic and sedative[4, 9, 13, 21, 100, 165, 192, 218]. The plant is used internally in the treatment of asthma, whooping cough, motion sickness, Meniere's syndrome, tremor in senility or paralysis and as a pre-operative medication[238]. Henbane reduces mucous secretions, as well as saliva and other digestive juices[254]. Externally, it is used as an oil to relieve painful conditions such as neuralgia, dental and rheumatic pains[238, 254]. The leaves should be harvested when the plant is in full flower and they can then be dried for later use[4]. This is a very poisonous plant that should be used with great caution, and only under the supervision of a qualified practitioner[21, 238]. See the notes above on toxicity. The seed is used in the treatment of asthma, cough. epilepsy, myalgia and toothache[218].

nrakta S. Europe. ksacta Dry, uncultivated ground, walls and field margins.

propta Seed - best sown as soon as it is ripe, older seed rapidly loses viability[200]. Either sow in situ or pot up the seedlings whilst still small because plants produce a long taproot and older plants resent root disturbance[200].

nwatta Prefers a hot dry position[200] in a wall or rock crevice[187]. Succeeds in a well-drained fertile soil, preferably of an alkaline nature, in full sun[200]. Grows well in maritime areas[200]. Plants are possibly hardy to about -10°c[187], they are unlikely to succeed in the colder areas of Britain. Self-sows freely, it can be grown in wild informal areas of the garden[200].

### 7.2.561 Helianthemum canadense

Frostweed, Longbranch frostweed 6 tin 9 cyuc 0 kcak 0 tcan 2 dwat  $0.4\,\mathrm{m}$  hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Helianthemum canadense is a PERENNIAL growing to  $0.4\,\mathrm{m}$  (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects, cleistogamy. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta Alterative Antiscrophulatic Astringent Cancer TonicThe dried leaves are alterative, antiscrofulatic, astringent and tonic[4, 21, 46, 207]. A tea made from the leaves is used in the treatment of kidney ailments and sore throats[222, 257]. A strong leaf tea has been used in the treatment of scrofula[222]. It is applied externally to skin diseases and eye infections[222]. It is said that an oil helpful in the treatment of cancer has been obtained from the plant[4]. Some caution is advised since an overdose can cause nausea and vomiting[4].

nrakta Eastern N. America - Maine to Ontario and Wisconsin, south to North Carolina and Mississippi. ksacta Open woods, clearings and barrens in dry sandy soils[43]

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 6 - 8cm with a heel, late summer in a sandy soil in a frame[200].

nwatta Requires a light well-drained soil in a sunny open position[200]. Tolerates a pH range from 5.5 to 8[200].

### 7.2.562 Helleborus foetidus

Stinking Hellebore, Setterwort, Bear's Foot, Bearsfoot, Setterwort, Stinkwort, Stinking Hellebore 6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.8 m hkuc

hmim cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Helleborus foetidus is an evergreen Perennial growing to 0.8 m (2ft 7in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from February to April, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland). It prefers moist soil.

poista All parts of the plant are poisonous[9, 10, 65], this poison can possibly be absorbed through the skin[76].

tcanta A decoction of the roots is used as a parasiticide against body lice, fleas etc[76, 213]. This use is somewhat dangerous, see the notes above on toxicity.

dwatta A very toxic plant that is considered to be useful for reducing blood pressure in various conditions of hypertension[213]. The root contains the alkaloids nervine. pseudo-nervine and veratridine[213]. It is best to harvest the root in the autumn and dry it for later use[213]. This species has similar medicinal properties to the black hellebore, H. niger[4]. These properties are:- Black hellebore is a very poisonous plant that is toxic when taken in all but the smallest doses. As such it should not be taken except under professional supervision. The plant contains cardiac glycosides which have a similar action to the foxglove (Digitalis spp) and it has been used as a heart stimulant for the elderly. though this treatment is no longer recommended[254]. The root is anthelmintic, cardiac, cathartic, diuretic, emetic, emmenagogue, irritant, violently narcotic and a drastic purgative[4, 9, 21, 46, 240]. It is harvested in the autumn and dried for later use[4]. It has been used in the treatment of dropsy, amenorrhoea, nervous disorders and hysteria, but it is very poisonous and great care must be taken over the dosage[4] The root is also applied externally as a local irritant[4], but even this should be done with care, see notes above on toxicity. A homeopathic remedy is made from the roots[9]. It is used in the treatment of headaches, psychic disorders, enteritis and spasms[9].

nrakta Western and southern Europe, including Britain, from Belgium to Spain and Italy. ksacta Woods, scrub and sunny banks on moist chalk and limestone soils[9, 17, 187].

propta Seed - best sown as soon as it is ripe in a cold frame[1, 134]. Sow stored seed as early in the year as possible[1], it usually germinates in the autumn to spring. Seed can take 18 months to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. This species produces flowering plants in 2 - 3 years from seed[200]. It is not possible to divide this species, but it is possible to take basal cuttings of young vegetative shoots[200]. Harvest the shoots when they are about 10cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Container, Massing, Rock garden. Woodland garden. Succeeds in any good garden soil[1]. preferring a moist well-drained rich loam in a sheltered position in partial shade[1, 4, 31, 111]. Plants are suitable for naturalizing in a woodland garden[200] and also succeed in the shade of a north-facing wall[233]. They do not object to lime[1]. Grow well in heavy clay soils[200]. Dislikes drought. The stems live for one or two years, dying after flowering[200]. Slugs are very fond of this plant and it will probably require some protection from them[187]. The various species in this genus hybridize freely[95]. There are some named forms, selected for their ornamental value[200]. The whole plant, especially when bruised, gives off an unpleasant smell that is similar to decaying meat[245]. Plants resent root disturbance and should be placed in their permanent positions whilst still small[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. Special Features: Attractive foliage, Not North American native, Naturalizing, All or parts of this plant are poisonous, Suitable for cut flowers, Flowers have an unpleasant odor.

by its native range it should succeed outdoors in many parts of this country. The following notes are based on the general needs of the genus. Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

# 7.2.537 Eupatorium lindleyanum

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Eupatorium lindleyanum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from September to October, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta HairUsed as a hair tonic[178]. The leaves, added to a hair pomade, promote the growth of the hair[218].

dwatta Anthelmintic Antidote Antitussive Diuretic Dysentery Restorative Women's complaintsThe whole plant is anthelmintic, antidote, antitussive, diuretic and restorative[178, 218]. It is used internally in the treatment of bronchitis and dysentery[238]. Externally, it is applied to swellings and wounds and is also important in the treatment of women's complaints, especially before and after parturition[218]. It is also used in the treatment of parasitic worms[218]. The leaves and stems are harvested in the summer before the flower buds open, and are dried for later use[238].

nrakta E. Asia - China, Japan, Korea, Manchuria. ksacta Wet grassy places in lowland and low mountains all over Japan[58]. Swamps or borders of water courses[178].

propta Seed - sow spring in a cold frame and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer. Division in spring or autumn[111]. Very easy, the clumps can be replanted direct into their permanent positions.

nwatta Requires a sunny position, succeeding in most well-drained but moisture retentive fertile soils[1]. Plants seem to be immune to the predations of rabbits[233]. There are both diploid and polypoid forms of this species. Whilst the diploids reproduce sexually, the polyploids, which are widespread, produce their seeds without sexual fertilization[275].

### 7.2.538 Onosma echioides

Onosma

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Onosma echioides is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The bristly stems and leaves can cause a good deal of irritation to the skin[219].

tcanta DyeA red dye is obtained from the root. It is an alkanna substitute[46, 61].

dwatta Alterative Laxative Poultice StimulantThe leaves are alterative[240]. They are made into a powder and given to children as a purgative[240]. The flowers are used as a cordial and stimulant in the treatment of rheumatism and palpitations of the heart[240]. The root is bruised and used as an external application to skin eruptions[240].

nrakta S. Europe to N. Africa. ksacta Limestone slopes and rocks to 1600 metres[187]. Crevices in rocks and cliffs[89].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in early spring. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in early summer. Cuttings in a frame in the summer. Shade them for the first  $10 \cdot 12$  days[1].

nwatta Requires a well-drained soil in full sun[1, 187]. Prefers a deep rather rich sandy loam[1]. Best grown in a crevice in a rock garden or on a wall[1, 187]. Tolerates hot dry conditions and also drought once it is established, but disliking winter wet[190]. Plants also dislike wet sumers[200]. Hardy to about -15°c[187]. There is some confusion over this species. It is given as a part of O. frutescens in some reports but [200] gives it specific status. A very ornamental plant[1].

## 7.2.539 Thymus camphoratus

Camphor Thyme

6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 0.4 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Thymus camphoratus is an evergreen Shrub growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

tcanta Deodorant Disinfectant EssentialThe essential oil obtained from the leaves is also used in perfumery, as a mouth wash, medicinally etc[200].

dwatta Antiseptic Deodorant DisinfectantAn essential oil obtained from the plant contains thymol, which is strongly antiseptic, deodorant and disinfectant[200]. The plant can be used fresh at any time of the year, or it can be harvested as it comes into flower and either be distilled for the oil or dried for later use[238].

nrakta Europe - Portugal. ksacta Dry sandy places and bushy places.

propta Seed - sow spring in a cold frame. Seed can also be sown in autumn in a greenhouse. Surface sow or barely cover the seed. Germination can be erratic. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of young shoots, 5 - 8cm with a heel, May/June in a frame[200]. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Layering.

nwatta Prefers a light, well-drained calcareous soil and a sunny position[2001]. Plants tolerate occasional walking on and can be grown in cracks in paths, they also succeed on walls[200]. Thymes dislike wet conditions, especially in the winter. A layer of gravel on the soil around them will help protect the foliage from wet soils[238]. The flowers are rich in nectar and are very attractive to honey bees[200]. This is a very difficult genus taxonomically, the species hybridize freely with each other and often intergrade into each other[200].

#### 7.2.540 Arnebia benthamii

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.9 m hkuc

htut cyutli kyuctcup hwicli hyishras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Arnebia benthamii is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) soils, prefers well-drained

soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta Cardiac Febrifuge MiscellanyCardiac and febrifuge. The plant is considered to be useful in the treatment of diseases of the tongue and throat[145, 240].

nrakta E. Asia - Himalayas from Pakistan to W. Nepal. ksacta Open slopes and shrubberies, 3000 - 4300 metres[51].

propta Seed - sow spring in a greenhouse. Germination usually takes place within 2 - 8 weeks at  $20^{\circ}$ ([134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer, after the last expected frosts. It is best to harvest the seed when it is slightly under-ripe, since it is quickly dispersed when ripe[200]. Cuttings with a heel in the autumn in sand in a cold frame[1]. Root cuttings in sand in a frame during the winter[1].

nwatta Requires a well-drained gritty soil and a sunny position in the rock garden or on a dry wall[1]. 211075

# 7.2.541 Clinopodium glabellum

Glade calamint

6 tlin 7 cyuc 0 kcak 3 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flat hpa7tmwatli hionli

drutta Clinopodium glabellum is an evergreen Perennial growing to 0.6 m (2ft) by 1.5 m (5ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

kcakta None Known

tcanta Bog gardens. A good fast growing, medium density ground cover. Can withstand some foot-traffic. An aromatic pest confuser that may confuse pests reducing their ability to find and eat crops [1-2].

nrakta Native to the US Nashville Basin of Tennessee, the Bluegrass Region of Kentucky, and two counties in Alabama. ksacta Found only on wet cedar glades and in seeps along limestone creekbeds. Due to its narrow range and specific habitat requirements, this species is considered vulnerable

propta Seed

nwatta An herbaceous perennial with showy flowers. Flower Color:Lavender. Bloom Size: 1"-2". Suitable Locations: Bog gardening. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. An evergreen. The root pattern is fibrous dividing into a large number of fine roots [1-2].

# 7.2.542 Arisaema ringens

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Arisaema ringens is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Flies. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil

pcista The plant contains calcium oxylate crystals. These cause an extremely unpleasant sensation similar to needles being stuck into the mouth and tongue if they are eaten but they are easily neutralized by thoroughly drying or cooking the plant or by steeping it in water.

dwatta Alterative FebrifugeAlterative, febrifuge[178].

nrakta E. Asia - China, Japan, Korea. ksacta Forests[178]. Woods near the sea, C. and S. Japan[58, 90].

propta Seed - best sown as soon as it is ripe in a shady position in a cold frame[134]. Stored seed remains viable for at least a year and can be sown in spring in the greenhouse but it will probably require a period of cold stratification. Germination usually takes place in 1 - 6 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least a coupe of years until the corms are more than 20mm in diameter. Plant out into their permanent positions whilst they are dormant. Division of tubers when the plant dies down in late summer.

nwatta Prefers a cool moist peaty soil in the bog, woodland garden or a sheltered border in semi-shade[134, 200]. Prefers a loamy or peaty soil[1] and will tolerate a sunny position if the soil is moist but not water-logged and the position is not too exposed[1, 200]. This is probably one of the hardiest members of the genus and should succeed outdoors in a suitable position in many parts of Britain[90]. Tubers should be planted about 10cm deep[233]. Only plant out full sized tubers and mulch them with organic matter in the winter[200]. Plants need protection from slugs[200]. Most species in this genus are dioecious, but they are sometimes monoecious and can also change sex from year to year.

# 7.2.543 Delphinium caeruleum

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Delphinium caeruleum is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant are toxic[65, 172]. The plant is most toxic when it is young[200].

tcanta Parasiticide Parasiticide A parasiticide is obtained from the leaves and roots[51, 61]. It is quite toxic and so is for external use only.

dwatta Parasiticide ParasiticideThe roots have been used to kill maggots in the wounds of goats[240].

nrakta E. Asia - Himalayas from Kumaon to Sikkim. ksacta Alpine areas from 2500 to 5000 metres[240].

propta Seed - sow March/April in a cold frame or May outdoors[111]. Keep moist and in a shady position until germination takes place[175]. The seed has a limited viability so it should be stored in a sealed container at about 3°c[200]. The seed usually germinates in 2 - 9 weeks at 15°c[175]. The seed usually germinates in 2 - 9 weeks at 15°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Cuttings of basal shoots in April/May, taken before they become hollow at the base, and planted in a cold frame[111]. Division in spring[111] or early autumn[200].

nwatta Prefers a rich well-drained soil that stays moist in the summer[111, 187]. Dislikes water-logged soils[200], it is liable to die out in heavy soils over winter[111]. Requires an open sunny position[188]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

### 7.2.544 Atropa bella

1258

Deadly Nightshade, Belladonna 6 tlin 9 cyuc 0 kcak 0 tcan 3 dwat 0.9 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Atropa bella-donna is a PERENNIAL growing to 0.9 m (3ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and

tcanta Hedge HedgeAn admirable dense ground cover plant[182, 208], though it might need weeding for the first year[197]. It can be clipped in spring to give denser growth[197, 208]. Plants should be spaced about 60cm apart each way[208]. Plants can be grown as a low hedge, the cultivar 'Furzey' is often used[29].

nrakta A hybrid of garden origin, E. herbacea x E, erigena. ksacta Not known in the wild.

propta Seed - surface sow in a sandy compost in a cold frame in spring. Keep moist. Prick out the plants as soon as they are large enough to handle and plant them in their permanent positions when they are 5 - 8cm tall[11]. This species is a hybrid and will not breed true from seed. Cuttings of half-ripe wood, 3cm long taken from twiggy lateral growths near the base of the plant, July/August in a frame. Remove the leaves from the bottom part of the stem without causing any damage to the bark. The cuttings root in a few weeks if they are given some bottom heat. Plant out in spring[11]. Layering in spring or autumn. Plants can be 'dropped' and then dug up and divided about 6 - 12 months later. Dropping involves digging up the plant and then replanting it about 15 - 20cm deeper in the soil to encourage roots to form along the stems[78].

nwatta Landscape Uses:Border, Container, Massing, Rock garden, Seashore, Specimen. Requires a light loam[11]. This species tolerates lime in the soil[182, 188] so long as there is plenty of humus[208]. Grows best in a poor soil. Resents dry soils. Prefers an open situation. A very ornamental plant[1], there are many named varieties[182]. Plants are quite fast growing[1]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Not North American native, All or parts of this plant are poisonous, Extended bloom season in Zones 9A and above. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

# 7.2.558 Coptis japonica

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Coptis japonica is an evergreen Perennial growing to 0.2~m (0ft 8in) by 0.5~m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention of toxicity has been found for this species, it belongs to a family that contains many species that are mildly toxic and so it is wise to treat this plant with some caution.

tcanta Can be grown as a ground cover plant in the peat garden[200].

dwatta Antibacterial Antiinflammatory Dysentery StomachicThe root is a pungent, very bitter, cooling herb that conrols bacterial and viral infections, relaxes spasms, lowers fevers and stimulates the circulation[238]. It is locally analgesic and anaesthetic[238] and is also anti-inflammatory and stomachic. It is used in the treatment of intestinal catarrh[4, 61, 174], dysentery, enteritis, high fevers, inflamed mouth and tongue, conjunctivities tet[238]. The root is harvested in the autumn and can be used fresh or dried[238].

nrakta E. Asia - Japan. ksacta Woods in mountains all over Japan[58].

propta Seed - best sown in a greenhouse as soon as it is ripe in an ericaceous compost[164]. Seal the pot in a polythene bag until germination takes place, which is usually within 1 - 6 months at 10°c[164]. Stored seed should be sown as early in the year as possible. Four weeks cold stratification may be beneficial[164]. Prick out the seedlings into individual pots when they are large enough to handle and grow on in a shady part of the greenhouse for at least their first winter. Plant them out in mid-autumn or in spring. Division in spring[200].

nwatta Requires a light moist humus-rich slightly acidic soil with a northerly aspect or light shade[1, 200].

# 7.2.559 Anemone quinquefolia

Wind Flower, Wood anemone, Twoleaf anemone, Nightcaps 6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.3 m hkuc pcimhmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Anemone quinquefolia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil and can tolerate drought.

pcista All parts of this plant contain protoanemonin, an irritating acrid oil that is an enzymatic breakdown product of the glycoside ranunculin. While protoanemonin can cause severe topical and gastrointestinal irritation, it is unstable and changes into harmless anemonin when plants are dried or heated[4, 10, 19, 65, 270]. An extremely acrid plant, even small doses causing a great disturbance of the stomach[207].

dwatta Rubefacient VesicantEmployed as a rubefacient in the treatment of rheumatism, gout and fevers, it is also used as a vesicant in the removal of corns[207].

nrakta Eastern N. America - Nova Scotia to Georgia, western Ontario, Minnesota and Tennessee. ksacta Moist open woods, thickets, clearings, streamsides, occasionally swampy areas at elevations from 30 - 1900 metres[270].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[1]. Surface sow or only just cover the seed and keep the soil moist. Sow stored seed as soon as possible in late winter or early spring. The seed usually germinates in 1- 6 months at  $15^\circ c[133]$ . When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first year. When the plants are large enough, plant them out in the spring. Division in late summer after the plant dies down.

nwatta Succeeds in ordinary garden soil but prefers a moist well-drained woodland soil[1, 200]. Prefers a moist peaty soil in some shade[187]. Tolerates drought during its summer dormancy[200]. Hardy to at least -20°c[187]. This species is very closely related to A . grayi , A . lancifolia , A . lyallii , A . oregana , and A . Piperi. This species complex also shares close morphologic affinities with both European species such as A . nemorosa and Asian species such as A . Altaica[270] Plants seem to be immune to the predations of rabbits[233]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54]. A good woodland plant[1, 187].

### 7.2.560 Hyoscvamus albus

White Henbane

1263

6 tlin 9 cyuc 0 kcak 0 tcan 4 dwat 0.9 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Hyoscyamus albus is a ANNUAL/BIENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista All parts of the plant are very toxic[7, 10, 19, 65, 76, 200]. Symptoms of poisoning include impaired vision, convulsions, coma and death from heart or respiratory failure[238].

dwatta Anodyne Antispasmodic Diuretic Epilepsy Hallucinogenic Hypnotic Mydriatic Narcotic Sedative Urinary-Henbane has a very long history of use as a medicinal herb, and has been widely cultivated to meet the demand for its use[4]. It is used extensively as a sedative and pain killer and is specifically used for pain affecting the urinary tract, especially when due to kidney stones[254]. Its sedative

is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Anthelmintic Antiinflammatory Antiseptic Bitter Cholagogue Emmenagogue Febrifuge Refrigerant Stomachic TonicThis species is one of several that are the source of the medicinal gentian root[46, 61], the following notes are based on the general uses of G. lutea which is the most commonly used species in the West[K]. Gentian root has a long history of use as a herbal bitter in the treatment of digestive disorders and is an ingredient of many proprietary medicines. It contains some of the most bitter compounds known and is used as a scientific basis for measuring bitterness[238]. It is especially useful in states of exhaustion from chronic disease and in all cases of debility, weakness of the digestive system and lack of appetite[4]. It is one of the best strengtheners of the human system, stimulating the liver, gall bladder and digestive system[238], and is an excellent tonic to combine with a purgative in order to prevent its debilitating effects[4]. The root is anthelmintic, anti-inflammatory, antiseptic, bitter tonic, cholagogue, emmenagogue, febrifuge, refrigerant, stomachic[4, 7, 9, 14, 21, 165, 238]. It is taken internally in the treatment of liver complaints, indigestion, gastric infections and anorexia[238]. It should not be prescribed for patients with gastric or duodenal ulcers[238]. The root is harvested in the autumn and dried for later use[4]. It is quite likely that the roots of plants that have not flowered are the richest in medicinal properties[4].

nrakta E. Asia - N.W. Himalayas, ksacta Grassy slopes. 1800 - 2700 metres[51].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically [200, 239]. It is advantageous to keep the seed at about 10°c for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°c will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238]. nwatta In general, gentians require a moist well-drained

soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species requires a stony soil with perfect drainage[239]. It is best given some protection from winter wet[239]. This plant has a reputation for not being hardy in Britain[239], though this is more likely to be connected to excess moisture than to low temperatures. Plants are intolerant of root disturbance[200].

# 7.2.555 Clinopodium umbrosum

6 tlin 9 cvuc 0 kcak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Clinopodium umbrosum is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is

1262

hardy to UK zone 7. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

tcanta EssentialYields an essential oil[145]. No more details are given.

dwatta VulneraryThe juice of the leaves is applied to cuts and wounds[272].

nrakta W. Asia - Caucasia, Afghanistan and the Himalayas. ksacta Forest shade and damp places, 1700 - 2500 metres in the Himalayas[145].

propta Seed - sow spring in a cold frame. Only just cover the seed. Germination usually takes place within 2 weeks at 21°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse. Plant them out in the summer if they have made sufficient growth, otherwise plant them out in late spring or early summer of the following year. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the summer or following spring. Cuttings of soft wood in May or June

nwatta Succeeds in almost any well-drained soil[1].

#### 7.2.556 Macromeria viridiflora

Giant Trumpets, Thurber's giant-trumpets 6 tlin 9 cvuc 0 kcak 0 tcan 1 dwat 0.9 m hkuc htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Macromeria viridiflora is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

tcanta Miscellany MiscellanyThe plant was collected by the Hopi Indians, dried and mixed with wild tobacco and used in rain-making ceremonies[187].

dwatta Miscellany MiscellanyThe dried plant, combined with mullein (Verbascum species) has been smoked in the treatment of craziness and fits[257].

nrakta South-western N. America - New Mexico to Arizona and N. Mexico. ksacta Rocky slopes and in valleys in pine forest and in scrub, 1000 - 2750 metres[187].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected

nwatta Requires a well-drained soil and a position in full sun[187]. Plants are hardy to about -15°c[187].

### 7.2.557 Erica x darleyensis

Darley Dale Heath, Cape Heath, Molten Silver Heath,

6 tlin 9 cvuc 0 kcak 2 tcan 0 dwat 0.6 m hkuc

htut cyutli tcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Erica x darleyensis is an evergreen Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from November to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

can grow in very alkaline soils. It can grow in full shade 7.2.545 Swertia petiolata (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The whole plant, and especially the root, is very poisonous[4, 7, 10, 19, 65, 165]. Even handling the plant has been known to cause problems if the person has cuts or grazes on the hand[4]. The plant is particularly dangerous for children since the fruit looks attractive and has a sweet taste[4]. The toxins are concentrated in the ripe fruit[200].

tcanta Soil reclamationThis species has been found to be effective in removing PCB's from the soil and detoxifying them[248]. The plant is more effective in doing this if it is infected with the bacterial parasite Agrobacterium tumefaciens[248].

dwatta Analgesic Antidote Antispasmodic Diuretic Hallucinogenic Homeopathy Mydriatic Narcotic Sedative UrinaryAlthough it is poisonous, deadly nightshade has a long history of medicinal use and has a wide range of applications, in particular it is used to dilate the pupils in eye operations, to relieve intestinal colic and to treat peptic ulcers[254]. The plant can be used to treat the symptoms of Parkinson's disease, reducing tremors and rigidity whilst improving speech and mobility[254]. It has also been used as an antidote in cases of mushroom or toadstool poisoning[7]. This is a very poisonous plant, it should be used with extreme caution and only under the supervision of a qualified practitioner[238]. See also the notes above on toxicity. All parts of the plant are analgesic, antidote, antispasmodic, diuretic, hallucinogenic, mydriatic, narcotic and sedative[4, 7, 9, 21, 46, 165, 171, 192, 2401. The root is the most active part of the plant, it. is harvested in the autumn and can be 1 - 3 years old, though the older roots are very large and difficult to dig up[4, 7]. The leaves are harvested in late spring and dried for later use[7]. All parts of the plant contain tropane alkaloids[254]. The leaves contain on average 0.4% active alkaloids, whilst the root contains around 0.6%[240]. The alkaloid content also varies according to the development of the plant, being low when the plant is flowering and very high when bearing green berries[240]. These alkaloids inhibit the parasympathetic nervous system which controls involuntary body activities. This reduces saliva, gastric, intestinal and bronchial secretions, as well as the activity of the urinary tubules, bladder and intestines[254]. An extract of the plant has been used as evedrops. It has the effect of dilating the pupils thus making it easier to perform eye operations[4, 232]. In the past women used to put the drops in their eyes in order to make them look larger and thus 'more beautiful'[4, 232]. The entire plant, harvested when coming into flower, is used to make a homeopathic remedy[232]. This is used especially in cases where there is localised and painful inflammation that radiates heat [232]. It is also used to treat sunstroke and painful menstruation[238].

nrakta Central and southern Europe, including Britain, south ad east to N. Africa and Iran. ksacta Woods, thickets and hedges, mainly on calcareous soils[9].

propta Seed - best sown as soon as it is ripe in a cold frame. Germination of stored seed is slow and erratic, usually taking 1 - 6 months at 10°c[134, 200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of softwood terminal shoots in spring[200]. Root cuttings in winter[200].

nwatta Succeeds in any well-drained moisture retentive soil[200] in sun or partial shade[238]. Prefers a calcareous soil[1, 4, 9, 13]. When grown as a medicinal plant, the highest levels of the medically active alkaloids are obtained from plants growing on a light, permeable chalky soil, especially when on a south-west facing slope[4]. The highest concentrations are also formed when the plant is growing in a sunny position and in hot summers[238]. The northerly limits of cultivation are about 50 - 55° north and at an altitude between 100 - 200 metres[4]. This species is widely cultivated, especially in eastern Europe, for the medically active compounds it contains. These are used in the drugs industry to produce a range of medicines[238]. Plants tend to be short-lived[200]. Slugs are very fond of this plant and have been known to completely remove the outer bark from the stems[K].

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc hmim cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Swertia petiolata is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist or wet soil.

dwatta Antiinflammatory Febrifuge HepaticThe entire plant is used in Tibetan medicine, it is considered to have a bitter taste and extremely cooling potency[241]. It is antiinflammatory, febrifuge and liver tonic[241]. It is used in the treatment of scleritis, inflammation of the liver and high blood pressure, inflammation of the stomach and liver[241].

nrakta E. Asia - Afghanistan to W. Nepal and S.E. Tibet. ksacta Montane to the alpine zone.

propta Seed - sow spring in temperatures not exceeding 10°c in a humus-rich medium[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them Tu in early summer.

nwatta Succeeds in a moist humus-rich soil in damp light woodlands, streamsides or the bog garden[200]. Grows best in areas with cool summers[200].

#### 7.2.546 Colchicum luteum

6 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 0.1 m hkuc htut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli

drutta Colchicum luteum is a BULB growing to 0.1 m (0ft 4in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from March to June, in flower from May to July, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. The plant is self-fertile. Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant, but especially the bulb[200], are poisonous[4, 7, 10, 19, 65]. They cause vomiting, violent purging, serious inflammation of the stomach and bowels, and death[232]. Handling the corms can cause skin allergies in some people[238].

tcanta The following notes are for C. autumnale. Since this plant also contains colchicine it can be assumed that it has the same uses[K]. The poisonous alkaloid 'colchicine' is extracted from this plant and used to alter the genetic make-up of plants in an attempt to find new, improved varieties[148]. It works by doubling the chromosome num-

dwatta Alterative Anodyne Aphrodisiac Carminative LaxativeThe corms are alterative, aphrodisiac, carminative and laxative[240]. They are used in India to treat gout, rheumatism and diseases of the liver and spleen[240]. They contain the toxic alkaloid 'colchicine' which is used externally to relieve pain[211, 240]. The dried corms contain around 0.25% colchicine and the seed about 0.4%[240].

nrakta E. Asia - China to the Himalayas. ksacta Stony or earthy hillsides and alpine meadows at higher altitudes[200].

propta Seed - best sown as soon as it is ripe in early summer in a seed bed or a cold frame[1, 164]. Germination can be very slow, taking up to 18 months at 15°c[164]. It is best to sow the seed thinly so that it is not necessary to transplant the seedlings for their first year of growth. Apply a liquid fertilizer during their first summer, however, to ensure they get sufficient nourishment. Prick out the seedlings once they are dormant, putting perhaps 2 plants per pot, and grow them on in a greenhouse or frame for at least a couple of years. Plant them out into their permanent positions when they are dormant[K]. The seedlings take 4 - 5 years to reach flowering size[1]. Division of the bulbs in June/July when the leaves have died down[1]. Larger bulbs can be planted out direct into their permanent positions, though it is best to pot up the smaller bulbs and grow them on in a cold frame for

a year before planting them out. The plant can be divided 7.2.548 Phlox nivalis every other year if a quick increase is required[1].

nwatta Prefers a rich well-drained loam that does not dry out rapidly in summer[1]. Requires a very sunny position[90]. This species is hardy to at least -15°c[200]. Plants can take 4 - 5 years to flower when grown from seed[164]. Plants seem to be immune to the predations of rabbits[233].

# 7.2.547 Scutellaria lateriflora

Virginian Skullcap, Blue skullcap 6 tlin 9 cvuc 0 kcak 2 tcan 3 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Scutellaria lateriflora is a PERENNIAL growing to 0.6 m (2ft) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Tincture overdose causes giddiness, stupor, confusion and seizures. Possible liver toxicity. may interfere with the immune response. Avoid during pregnancy [301].

dwatta Anticonvulsant Antispasmodic Astringent Diuretic Emmenagogue Epilepsy Miscellany Nervine Sedative TonicA commonly used herbal medicine. Virginian skullcap is a very effective nervine that has traditionally been used in the treatment of a wide range of nervous conditions. Its tonic and restorative properties help to support and nourish the nervous system, calming and relieving stress and anxiety[222, 238, 244, 254]. Very little research has been carried out on this species, despite its long use in American and British herbal medicine[244]. Research is sorely needed, and may reveal more uses for this valuable herb[254]. The leaves are antispasmodic, slightly astringent, diuretic, nervine, sedative and strongly tonic[4, 21, 46, 165]. They are harvested in early summer and dried for later use[4]. It is used in the treatment of various problems of the nervous system including epilepsy, insomnia, anxiety, delirium tremens, withdrawal from barbiturates and tranquillisers, and neuralgia[222, 238, 244]. An infusion of the plant has been used to promote suppressed menstruation, relieve breast pain and encourage expulsion of the placenta[213, 254], it should not be given to pregnant women since it can induce a miscarriage[238]. This plant should be used with some caution since in excess it causes giddiness, stupor, confusion and twitching[238]. The plant was once believed of use in the treatment of rabies, though there is no evidence to support this[207, 213].

nrakta N. America - Newfoundland to British Columbia, south to Florida and Ontario. ksacta Alluvial thickets, meadows and swampy woods[43].

propta Seed - sow in situ outdoors in late spring. If there is only a small quantity of seed it is better to sow it in a pot in a cold frame in early spring. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the spring. Division in spring just before new growth begins. Very easy, larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Basal cuttings in early summer in a frame. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in a sunny position in any ordinary garden soil that does not dry out during the growing season[200]. Plants are not so long-lived when grown in rich soils[4]. Many of the plants grown under this name in gardens are in fact S. altissima[238]. It is important to ensure you have the correct plant if using it medicinally[238]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

drutta Nicotiana alata is a PERENNIAL growing to 0.6 m (2ft) by 0.3 m (1ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant are poisonous[1, 65, 76].

tcanta InsecticideAll parts of the plant contain nicotine, this has been extracted and used as an insecticide. Landscape Uses: Border, Container, Massing, Specimen, Dvnamic accumulator.

nrakta S. America - S. Brazil to N. Argentina. Locally naturalized in C. Europe. ksacta Not known

propta Seed - surface sow in a warm greenhouse about 10 weeks before the last expected spring frosts. The seed usually germinates in 10 - 20 days at 20°c. Keep the soil moist and pot up as soon as the plants are big enough to handle, planting them out after the last expected frosts.

nwatta Prefers a well-drained deep rich moist soil in a sunny position[1, 108]. Hardy to about -5°c[200], this plant is usually grown as an annual in Britain, flowering well in its first year, but it does survive mild winters outdoors[1]. A very ornamental plant[1], it has sweetly scented flowers that release most of their scent in the evening and attract moths[30]. Plant requires more than 14 hours daylight per day to induce flowering[169]. Special Features: Attracts birds, Not North American native, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Suitable for cut flowers. Fragrant flowers. Attractive flowers or blooms.

#### 7.2.552 Chaenactis douglasii

Morning Brides, Douglas' dustymaiden, Alpine dustymaiden 6 tlin 9 cvuc 0 kcak 0 tcan 2 dwat 0.4 m hkuc htut cyutli kyuctcup hwicli hyishras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Chaenactis douglasii is a BIENNIAL/PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor kaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta Cardiac Poultice StomachicMorning brides was employed medicinally by a number of native North American Indian tribes who used it to treat a variety of complaints. but especially to treat skin problems[257]. It is not generally used in modern herbalism. An infusion of the whole plant has been given to children in order to slow their heart rates[257]. It is also used in the treatment of stomach complaints, coughs and colds[257]. The fresh plant, or sometimes just the leaves, are crushed and applied as a poultice to swellings, sores and aches[207, 257]. An infusion is used as a wash for a variety of skin problems including pimples, chapped hands, boils and insect bites[257].

nrakta Western N. America - Montana to British Columbia, south to Arizona, California and New Mexico, ksacta Dry to medium-moist soils along roadsides, waste places and hillsides, especially where the soil has been disturbed[212].

propta Seed - surface sow in spring in a greenhouse[207]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer.

nwatta Requires a deep well-drained gritty or gravelly soil, preferably of low fertility and a sunny position[207] Grows well in the rock garden[207]. The plant is a biennial or short-lived perennial[207].

# 7.2.553 Asarum arifolium

6 tlin 9 cyuc 0 kcak 0 tcan 1 dwat 0.2 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Asarum arifolium is an evergreen Perennial growing to 0.2 m (Oft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista Although no reports of toxicity have been found for this plant, at least 3 other members of this genus have reports that the leaves are toxic[7, 19]. Some caution is therefore advised in the use of this plant.

tcanta EssentialAn essential oil obtained from the plant has the odour of sassafras[4].

dwatta StomachicThe root is stomachic[61].

nrakta South-eastern N. America - Virginia to Louisiana. ksacta Upland deciduous and mixed deciduous-conifer forests from sea level to 600 metres[270].

propta Seed - best sown in a cold frame as soon as it is ripe in the summer[134]. Stored seed will require 3 weeks cold stratification and should be sown in late winter[134]. The seed usually germinates in the spring in 1 - 4 or more weeks at 18°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. Plant them out when large enough in late spring. Division in spring or autumn. Plants are slow to increase[200]. It is best to pot the divisions up and keep them in light shade in the greenhouse until they are growing away strongly.

nwatta Prefers a rich moist neutral to acid soil in woodland or a shady position in the rock garden[1, 200]. Plants are hardy to at least -15°c[200]. The flowers are malodorous and are pollinated by flies[200]. The root has a pungent, aromatic smell like mild pepper and ginger mixed, but more strongly aromatic[245]. Plants often self-sow when growing in a suitable position[200].

# 7.2.554 Gentiana kurroo

6 tlin 9 cvuc 0 kcak 0 tcan 3 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Gentiana kurroo is a PERENNIAL growing to 0.2 m (Oft 8in). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September. The species

their ornamental value [200]. 'Silver Lace' is a dwarf clumping plant that grows well in containers and is more attractive with larger flowers than the type [183, 200].

#### 8.2.51 Brassica oleracea sabauda

Savoy Cabbage

7 tlin 11 cyu<br/>č4kcak2tcan0dwa<br/>t $0.8~\rm{m}$ hkuc hmimhtut cyutli tcup hwic<br/>li hrasjlutnyikfrip hpa7tli flatprikl-

wis hpa7tmwatli fyifxre7t hjonli

drutta Brassica oleracea sabauda is a BIENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[2, 16, 46]. The leaves have a very attractive crin-liked appearance, but are somewhat tougher than other cabbages. Finely shredded, they can be used in salads, though many people find them indigestible this way. They are delicious cooked, especially the younger leaves since the older ones can be quite tough[K]. Through careful selection of varieties, they are usually available from the autumn until the spring[K].

tcanta Dynamic accumulator.

nrakta  $\mathring{A}$  cultivated form of B. oleracea. ksacta Not known in the wild.

propta Seed - sow in a seedbed outdoors in April/May. Plant out in summer as space permits. Do not let the seedlings get overcrowded or they will soon become leggy and will not make such good plants. If your seedlings do get leggy, it is possible to plant them rather deeper into the soil - the buried stems will soon form roots and the plant will be better supported.

nwatta Succeeds in full sun in a well-drained fertile preferably alkaline soil[16, 37, 200]. Prefers a heavy soil[16]. Prefers a soil that is not too rich[37]. Succeeds in any reasonable soil. Succeeds in maritime gardens[200]. The savoy cabbage is often grown for its edible leaves. This is a very hardy form of cabbage that is able to withstand quite severe winters, providing leaves from autumn to the spring. There are many named varieties. The savoy, however, is considered by many people to be coarser tasting than other cabbages and is less grown nowadays.

### 8.2.52 Pimpinella anisum

Aniseed (Saunf - Hindi), Anise burnet saxifrage 7 tlin 10 cyuc 4 kcak 0 tcan 3 dwat 0.5 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Pimpinella anisum is a ANNUAL growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf from May to October, in flower in July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Condiment TeaYoung leaves - raw or cooked[2, 14, 21, 37, 52]. The leaves have a sweet aniseed flavour, they are very refreshing to chew and are also nice as a flavouring in salads, puddings, soups, stews etc[183, K]. When adding to cooked dishes, only add the leaves for the last few minutes of the cooking or the flavour will be lost[K]. The aromatic seed is eaten raw or used as a flavouring in raw or cooked foods such as soups, pies, bread and cakes[2, 14, 20, 21, 27, 37, 244]. A distinctive sweet liquorice flavour[183], its use improves the body's ability to digest food[244]. The seed is harvested by cutting the whole plant when the seed is ripe. The plants

are then kept in a warm, dry position for a week and then threshed to remove the seeds. Store the seeds in the dark in an airtight jar[244]. An essential oil from the seed is used as a food flavouring in sweets (especially aniseed balls) ice cream, chewing gum, pickles etc[57, 183, 238]. It is also often used to flavour alcoholic drinks such as pernod, ouzo and anisette[238, 244]. The leaves and the seeds can be brewed into a sweet liquorice-like tea[183].

tcanta Essential Insecticide Pot-pourri Repellent TeethAn essential oil is obtained from the seed, used in perfumery, tooth pastes, medicinally and as a food flavouring[57, 238]. The powdered seed can be used as a dentrifice and mouthwash[201]. The plant is an ingredient of pot-pourri. The plant can be used as an insect repellent but it is also said to attract mice[14]. If aniseed oil is liberally smeared around live-traps it can attract mice and other rodents into them[4, 201]. The plants seem to be immune to the predations of slugs and snails and can help to protect neighbouring plants[201]. A spray made by boiling of one part coriander leaves and one part anise seeds in two parts of water is very effective against red spider mites and woolly aphids[201].

dwatta Antiseptic Antispasmodic Appetizer Aromatic Carminative Digestive Expectorant Galactogogue Pectoral Stimulant Stomachic TonicAniseed has a delicious sweet liquorice-like flavour and is a commonly used and very safe herbal remedy that is well suited for all age groups from children to the elderly. However, its use has declined in recent years with the advent of cheaper substitutes such as Illicium verrum and synthetic substances[238]. It is a particularly useful tonic to the whole digestive system and its antispasmodic and expectorant effects make it of value in the treatment of various respiratory problems[254]. The seed is the part used, generally in the form of an extracted essential oil[4]. The essential oil comprises 70 - 90% anethole, which has an observed oestrogenic effect whilst the seed is also mildly oestrogenic[254]. This effect may substantiate the herb's use as a stimulant of sexual drive and of breast-milk production[254]. The essential oil should not be used internally unless under professional supervision whilst the seeds are best not used medicinally by pregnant women, though normal culinary quantities are quite safe[254]. The seed is antiseptic, antispasmodic, aromatic, carminative, digestive, expectorant, pectoral, stimulant, stomachic and tonic[4, 9, 14, 20, 21, 46, 165, 201]. It is of great value when taken internally in the treatment of asthma, whooping couch, coughs and pectoral affections as well as digestive disorders such as wind, bloating, colic, nausea and indigestion[4, 254]. Externally it is used to treat infestations of lice, scabies and as a chest rub in cases of bronchial disorders[238]. A strong decoction of the seeds can be applied externally to swollen breasts or to stimulate the flow of milk[244]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Pimpinella anisum for cough and bronchitis, fevers and colds, common cold, inflammation of the mouth and pharynx, dyspepsia, loss of appetite (see [302] for critics of commission E). Contraindicated in patients allergic to anise and anethol. Sensitization as an adverse effect observed rarely.

nrakta S. Europe - Greece. ksacta Not known in a truly wild situation

propta Seed - sow mid to late spring in situ. This sowing only succeeds in producing a crop of ripe seeds in years when the summers are hot[238]. A more certain crop (but much more labour intensive) can be obtained by sowing 4 - 5 seeds per pot in a greenhouse in early spring. They should germinate within 3 weeks. Thin if necessary to the best seedling and plant them out after the last expected frosts[K]. Aniseed strongly resents root disturbance.

nwatta Succeeds in ordinary garden soil[1] but prefers a fairly rich warm well-drained light soil in a sunny position[1, 27, 37, 52]. Prefers a pH in the range 6 to 7.5[238]. Aniseed has a very long history of herbal and culinary use, and is often cultivated for its edible and medicinal seed in warm temperate zones[46, 244]. The plant needs warm summers if it is to grow well and seeds only ripen in Britain in long warm summers[4, 37, 200]. Plants strongly resent root disturbance and should not be transplanted. A good companion plant in the garden, its aromatic nature helping to keep nearby plants free of aphis etc. Its flowers attract parasitic wasps to the garden and these prey on a large number of garden pests[238]. Aniseed grows especially well with co-

grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The seed is poisonous[1, 11] and so are the leaves[218]. Although we have no more information, it is reasonable to assume that all other parts of the plant are also toxic.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used as a beverage[11]. As pleasant as bilberries[177]. Use with great caution since most parts of the plant, including the seed[177], are probably very toxic and some reports suggest the fruit should not be used at all[11]. The roots are antirheumatic[218]. The plant is hallucinatory in small quantities[218].

dwatta Anodyne Antiphlogistic Antirheumatic Depurative Febrifuge Hallucinogenic Poultice Vermifuge Vulnerary-The leaves are anodyne, antiphlogistic, febrifuge, depurative, poultice and vermifuge 147, 2181.

nrakta E. Asia - China. ksacta Grassy hills and river valleys to 1500 metres. Occasionally found at higher elevations in stony and arid areas[109].

propta Seed - sow February/March in a greenhouse[78]. The seed usually germinates in 1 - 3 months at 15°c[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7cm with a heel, luly/August in a frame. Fair percentage[78].

nwatta Prefers a fairly good loamy soil in a sunny sheltered position[11, 164, 200]. Succeeds in light shade[200] This species is not very hardy in Britain, tolerating temperatures down to about -5°c though it can resprout from the base if cut back by the cold[200]. This new growth does not flower in its first year[182]. The roots of plants in this genus bear nitrogen-fixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

# 8.1.20 Acacia angustissima

Prairie acacia. Timbre. Fernleaf Acacia tfo2n 7 tlin 10 cyuc 2 kcak 4 tcan 3 dwat 5 m hkuc htut cyutli hgatkyuctcup hwicil hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Acacia angustissima is an evergreen Tree growing to 5 m (16ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It can fix Nitrogen. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista Especially in times of drought, many Acacia species can concentrate high levels of the toxin Hydrogen cyanide in their foliage, making them dangerous for herbivores to eat

kcakta Edible Parts: Inner bark SeedpodEdible Uses: The seedpods have been used for food by local peoples[46]. The bitter astringent bark is used in Mexico for precipitating mucilaginous matter and inducing fermentation in the making of alcoholic drinks[303].

tcanta Biomass Mulch Pioneer Soil reclamation TanninAgroforestry Uses: Although it may not grow into a large tree, it can be extremely valuable for use as pioneer species for rejuvenating degraded lands, and as a nurse crop for more valuable tree species. Its potential as a mulch producer has come into question, because of the presence of secondary compounds that bind the nitrogen and result in low quality (slowly decomposing) prunings. This may mean that the mulch is a poor nitrogen source for the present crop. but it may have greater residual effects that could benefit the subsequent crop, or be a good nitrogen source to help build up organic matter in the soil. These long-term benefits could outweigh the initial low nutrient return to the soil over a number of years. Slowly decomposing prunings may have value for suppressing weed growth in associated crops[303 ]. Other Uses: Tannin is obtained from the bark[46]. Bark harvested for its tannins should only be taken from mature stems, and only when the sap is rising at the beginning of the

growing season - which is when the tannin content is highest and the bark is most easily removed from the wood[601]. Carbon Farming - Industrial Crop: biomass. Agroforestry Services: nitrogen, alley crop.

dwatta DysenteryAcacia angustissima is an important medicinal species for the Tzotzil and Tzeltal Maya Indians in Mexico. They rank it the 4th most important species in the cure of bloody diarrhoea and 7th in the treatment of mucoid diarrhoea. It is also used as a cure for toothache, rheumatism and skin lesions, and is reported to inhibit growth in malignant tumours. Tests also show that it possesses a mild antimicrobial effect on Escherichia coli and Staphylococcus aureus[303]. The medical activity will at least be partly due to the astringent tannins found in the plant[K]. The bark of all Acacia species contains greater or lesser quantities of tannins and are astringent. Astringents are often used medicinally - taken internally, for example. they are used in the treatment of diarrhoea and dysentery, and can also be helpful in cases of internal bleeding. Applied externally, often as a wash, they are used to treat wounds and other skin problems, haemorrhoids, perspiring feet, some eye problems, as a mouth wash etc[601, K]. Many Acacia trees also yield greater or lesser quantities of a gum from the trunk and stems. This is sometimes taken internally in the treatment of diarrhoea and haemorrhoids[601].

nrakta C. America - Panama, north to Mexico and southern N. America. ksacta It is a subtropical plant. Hillsides, rock slopes, summits and in grassland with other shrubs, often in deciduous or semi-deciduous forest[303]. Mostly on rather dry, often rocky, brushy slopes or in thin forest, frequent in pine-oak forest, sometimes in hedges, to 2,700 m[331]

propta Seed - germinates best when soaked for 12 hours in cold water prior to sowing[303]. The standard seed treatment for Acacia species (pre-soaking the seed in warm water for 12 hours) results in inferior germination. Scarifying the seed by scratching or nicking the round end of each seed with a file, knife or nail clipper (without damaging the cotyledon) before sowing has also been suggested[303]. Fernleaf acacia seems to fare better when grown from transplanted seedlings than from direct seeding. If it is to be directly seeded, then it is important not to sow too deeply. The seeds should be sown on the surface of cultivated soil and covered with a layer of soil equal to the width of the seed[303].

nwatta Agroforestry Services: Alley crop Agroforestry Services: Nitrogen Industrial Crop: Biomass Management: Coppice Management: Standard Regional CropAcacia angustissima is a versatile plant that can grow from the warm temperate zone to the tropical zone. It succeeds at elevations from sea level to 2,600 metres, tolerating a mean annual temperature in the range of 5 - 30°c and a mean annual rainfall in the range 895 - 2.870mm[303]. It can tolerate quite cold climates with occasional temperatures falling below freezing[303]. Grows best in a sunny position. Grows well in free-draining, acidic, infertile soils[303]. It is adapted to a wide range of soils including vertisols of slightly alkaline pH[415]. A very drought-tolerant plant, possibly due to its substantial taproot. It can retain its green foliage in dry seasons that can be as long as 8 months[303]. Acacia angustissima is fast-growing, quick to mature and a prolific seed producer[303]. It flowers throughout the year in its natural range[303]. This ability to grow quickly and reproduce when young has resulted in the plant becoming weedy and forming thickets, especially along roadsides and in sandy soil in pastures in its native range[303]. This weed potential has created concern among some researchers about the advisability of its use in agroforestry or agricultural systems[303]. The plant responds well to regular cutting and to coppicing[303 This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. When introducing A. Angustissima into a new area it may be necessary to inoculate with an appropriate Rhizobium before planting[303]. Carbon Farming -Cultivation: regional crop. Management: standard, coppice. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2].

### 8.1.21 Medicago arborea

Moon Trefoil

tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 2 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Medicago arborea is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from May to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked[K]. This plant was supplied to Plants for a Future in early 1994 from a person in Greece who said that it was often used in salads there[K]. Young shoots, when the plant is growing vigorously, have a slightly sweet, grass-like flavour but a rather chewy texture[K]. Older leaves, and younger leaves if the plant is not growing vigorously, have a distinct bitterness and are rather unpleasant[K].

nrakta Europe - Mediterranean. ksacta Scrub and rocky hillsides[184].

propta Pre-soak the seed for 12 hours in warm water and then sow in spring in a greenhouse[200]. The seed can also be sown in a greenhouse in autumn. Germination should be quite rapid. Prick out the seedlings into individual pots when they are large enough to handle and grow them on for at least the first winter in a greenhouse. Plant out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[188]. Very easy if bottom heat is given[11].

nwatta Requires a warm position in full sun, succeeding in dry or well-drained moist soils[182]. Best grown against a wall[182] in the colder areas of the country[188]. Tolerant of wind and salt spray[200], it grows well in maritime gardens[184]. Plants are not hardy in the colder areas of Britain, they tolerate temperatures down to about -10°c when fully dormant[184, 200], though the young growth in spring can be damaged by late frosts. They do not succeed in the open at Kew, though they grow well against a wall[11]. The flowers have a vanilla or sweet pea scent[245]. Any pruning should consist of cutting out dead wood in the spring[188]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.22 Coriaria napalensis

tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Coriaria napalensis is a deciduous Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

poista The seed is poisonous[1, 177]. Although we have no more information, it is reasonable to assume that other parts of the plant are also toxic.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used as a beverage[145, 146, 272]. Use with great caution since most parts of the plant, including the seed, are very toxic[177]. Some reports suggest it is safer not to use the fruit at all[11]. The fruit is about 8mm in diameter[200].

tcanta Basketry Dye Ink Tannin WoodThe wood contains a considerable quantity of tannin[146, 272]. The leaves contain 20% tannin[240]. The branches are used for making baskets[272]. Wood - hard, beautifully marked, takes a good polish. Used for picture frames and other small articles[146, 1581.

dwatta StomachicThe juice of the bark is used in the treatment of stomach aches[272]. Some cauion is advised - see notes above on toxicity[K].

nrakta E. Asia - Himalayas from Pakistan to S.W. China. ksacta Forests and shrubberies, mainly on the outskirts of the forests, 1000 - 2700 metres[51]. Plants are found at elevations up to 3300 metres in Sikkim[146].

propta Seed - sow February/March in a greenhouse[78]. The seed usually germinates in 1 - 3 months at 15'c[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7cm with a heel, July/August in a frame. Fair percentage[78].

nwatta Prefers a fairly good loamy soil in a sheltered position in full sun or light shade[11, 164, 200]. This species is not very hardy in Britain, it tolerates temperatures down to about -5°c[200]. According to one report plants succeed at Kew but are frequently cut to the ground in severe winters though they resprout from the base[11, 200]. This new growth does not flower in its first year[182]. However, a medium-size tree seen at Kew in 1990 seemed to have survived many winters without untoward damage[K]. The roots of plants in this genus bear nitrogen-fixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

#### 8.1.23 Acacia mucronata

Narrow-Leaf Wattle

htto beta heade tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat m hkuc htut cyutli hgatkyuctcup hwicli hyishras hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Acacia mucronata is an evergreen Tree growing to 9 m (29ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in March. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure

kcakta The following uses are for the closely related A. longifolia, they almost certainly also apply to this species[K]. Flowers - cooked[144]. Rich in pollen, they are often used in fritters. Seed - roasted[2, 46, 61, 105]. Starchy[177]. Acacia seeds are highly nutritious and contain approx 26% protein, 26% available carbohydrate, 32% fibre and 9% fat[278]. The fat content is higher than most legumes with the aril providing the bulk of fatty acids present[278]. These fatty acids are largely unsaturated which is a distinct health advantage although it presents storage problems as such fats readily oxidise[278]. The mean total carbohydrate content of 55.8 + 13.7% is lower than that of lentils, but higher than that of soybeans while the mean fibre content of 32.3 + 14.3% is higher than that of other legumes such as lentils with a level of 11.7%[278]. The energy content is high in all species tested, averaging 1480+270 kJ per 100g[278]. Wattle seeds are low glycaemic index foods. The starch is digested and absorbed very slowly, producing a small, but sustained rise in blood glucose and so delaying the onset of exhaustion in prolonged exercise[278]. Seedpods - roasted[177]. The pods are up to 10cm long[219].

tcanta The following uses are for the closely related A. longifolia, they almost certainly also apply to this species[K]. A yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. The extensive root system of this plant helps to prevent soil erosion[200]. It is used on sandy soils and steep banks[200]. Trees are planted as a screen in Australia[157]. This species is often grown as a rootstock for grafting lime-intolerant members of the genus[11]. Wood - pale, tough[154].

nrakta Australia - Tasmania, Victoria. ksacta Usually occurs in forests and woodlands, sometimes forming low closed forests, from sea-level to the highland zone

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are

3cm wide at the top, they are tender and juicy but usually insipid[K]. Occasionally the root has a pleasant acid flavour, we have yet to find out what causes the difference[K].

nrakta Southern N. America - Mexico. Occasionally established in Europe. ksacta Not known

propta Seed - best sown as soon as ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Our plants have never produced seed. Division in autumn, harvest the bulbs and replant in the spring. They usually increase very freely.

nwatta An easily grown plant, preferring a sandy soil in a warm dry position[1, 27, 37]. It dislikes dry or heavy soils[37]. Dislikes lime[37]. Prefers a southerly aspect[37]. This species is only hardy outdoors in the milder areas of Britain, tolerating temperatures down to about -5°c or perhaps a bit lower if the soil is very well-drained. The bulbs are easily harvested in late autumn, however, and can be stored overwinter in a cool frost free place, replanting them in the spring[K]. In milder winter areas a good mulch is usually sufficient to see the bulbs through the winter and they will then normally be more productive of leaves and flowers in the following year. Plants have survived the winter for several years without a mulch on our trial grounds in Cornwall[K]. A very ornamental plant, flowering freely all summer[1, K]. It was formerly cultivated in Mexico for its edible tuber[46] (this may be a mistaken entry that should have referred to O. tuberosa. Whilst the root of this plant is edible it is neither productive nor very flavourful. The leaves and the flowers are far superior[K]). This species is closely related to and probably part of O. tetraphylla[200], differing only in its sessile bulbils and truncate leaves[50].

# 8.2.49 Brassica oleracea capitata

Cabbage, Ornamental Cabbage, Red Cabbage, Savoy Cabbage

7 tlin 11 cyuc 4 kcak 3 tcan 0 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli frusflatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Brassica oleracea capitata is a BIENNIAL growing to 0.8 m (2ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves raw or cooked[1, 27, 46]. Cabbages are generally used as a cooked vegetable, though the shredded leaves can also be eaten in salads. Dutch cabbages are generally sweeter and milder in flavour making them more suitable for raw eating. Those leaves in the heart of the plants are more tender than outside leaves and so are also more suitable for eating raw. These heart leaves, though, are less nutritious because they have been excluded from the light[K]. Many people find that the raw leaves give them indigestion[K]. The leaves can be fermented and made into sauerkraut, used as a health food and said to be good for the digestive system[K]. By careful selection of cultivars, it is possible to harvest cabbages all year round[K]. Seeds - sprouted and added to salads. Very good eating[183].

tcanta DyeA blue dye can be obtained from the leaves of purple cultivars[168].

nrakta A cultivated form of B. oleracea. ksacta Not known in the wild.

propta Seed - this can be sown from early spring to late summer in a seedbed outdoors, depending on the cultivar. The plants are moved to their final positions when about 7 - 15cm tall. Do not let the seedlings get overcrowded or they will soon become leggy and will not make such good plants. If your seedlings do get leggy, it is possible to plant them rather deeper into the soil - the buried stems will soon form roots and the plant will be better supported. For a summer crop, the seed is sown in early to late spring, autumn maturing

cultivars are sown in mid to late-spring and winter maturing cultivars in late spring. Winter to spring maturing cultivars are sown in mid to late summer, these are often sown in situ and thinned as required. Seed of fast-growing summer cabbages can also be sown in a greenhouse in January/February in order to provide an early crop. This is planted out in early to mid-spring as the weather allows and can be harvested in late spring and early summer.

nwatta Landscape Uses:Border, Container, Massing, Succeeds in full sun in a well-drained fertile preferably alkaline soil[16, 37, 200]. Prefers a heavy soil and a cool moist climate[16, 27]. Succeeds in any reasonable soil. Succeeds in maritime gardens[200]. Tolerates a pH in the range 4.3 to 8.3. The cabbage is widely cultivated throughout the world for its edible leaves There are three main types of cabbage, the common hearting cabbage has dark green leaves, Dutch cabbages form a much larger heart and the leaves. which have a milder flavour, are a pale green or even white, whilst the third type, red cabbages, has red leaves. There are many named varieties of each type and by careful choice of varieties it is possible to ensure a year round supply of fresh leaves. Several cultivars are hardy enough to stand the rigours of a British winter, there are also some less-hardy varieties that can be harvested in early winter and stored for a few months in a cool place to provide leaves in areas with very severe winters[200]. Some varieties have been selected for the ornamental value of their leaves, these tend to be of poor culinary quality[206]. Cabbages are good companions for dill, camomile, sage, wormwood, mint and other aromatic plants which help to reduce insect predations on the cabbages[18, 201]. Cabbages also grow well with potatoes and beet[201]. They grow badly with strawberries, tomatoes and climbing beans[18, 201]. Special Features: Attractive foliage, Not North American native, Attracts butterflies, Inconspicuous flowers or blooms.

# 8.2.50 Tulbaghia violacea

Society Garlic

7 tlin 11 cyuc 4 kcak 3 tcan 0 dwat 0.3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Tulbaghia violacea is an evergreen Perennial growing to 0.3 m (1ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and stems - raw or cooked. A mild garlic flavour, they are used as a flavouring in soups and salads[183]. Flowers - raw or cooked. They can be added to salads, used as a garnish or as a flavouring in cooked foods[183]. The flowers are very ornamental, they have a sweet, onion-like heat in the mouth.

tcanta Companion Cut flowersLandscape Uses: Border, Container, Ground cover, Rock garden, Seashore. Special Features: Attractive foliage, Not North American native. Suitable for cut flowers. Fragrant flowers. Attractive flowers or blooms.

nrakta S. Africa - Eastern Cape, Transvaal. ksacta Forest margins and stream banks[282].

propta Seed - best sown as soon as it is ripe in the greenhouse[200]. Sow stored seed in early spring in the greenhouse[200]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse for at least their first winter. If planting them outdoors, this is best done in late summer when the plants are dormant. Division of the dormant plants in late summer.

nwatta Requires a well-drained soil in a sunny sheltered position[200]. Hardy in the mildest areas of Britian, tolerating temperatures down to about -10°c, it can be grown as a bedding plant or at the base of a warm wall[200]. Plants succeed outdoors at Edinburgh botanical gardens[90]. Plants grow from a cluster of small bulbs attached to a basal plate that is sometimes regarded as a rhizome[200]. The flowers are very fragrant at night, the whole plant has a garlic-like aroma[200]. There are some named varieties, selected for

nrakta Pantropical. ksacta Moist, marshy or inundated localities, shallow pools, ditches, rice fields, forming dense masses[310]. Also found along roadsides at elevations from sea-level up to 1,000 metres[310].

propta Seed - sow in situ in moist to wet soil[300 ]. Only the annual form is usually propagated this way[300 ]. Germination rates of local cultivars are often low (less than 60%) because of hard-seededness induced by long storage. Reliable seed companies supply improved cultivars with a high (in excess of 80%) germination percentage. The seeds do not germinate well at temperatures lower than 25°c[299 ]. Cuttings of young shoots at any time of the year. The shoots readily produce roots, even whilst still on the parent plant[300 ].

nwatta Swamp morning glory is a plant of the moist to wet, lowland tropics, where it is found at elevations up to 1.000 metres. It grows best in areas where annual daytime temperatures are within the range 15 - 35°c, but can tolerate 10 - 40°c[418]. It prefers a mean annual rainfall in the range 2,000 - 2,500mm, but tolerates 700 - 4,200mm[418]. Plants grow well in full sun[296]. A very easy plant to grow. it succeeds in bathtubs, ponds and still water[296]. Succeeds in a wide range of soils, including heavy clays[300]. Best leaf production comes from plants grown in soils rich in organic matter[298]. Prefers a pH in the range 5 - 7, tolerating 4.3 - 7.5[418]. The plant is widespread as a swamp weed in all tropical and many subtropical lowland areas. It is a declared aguatic or terrestrial noxious weed in the southeastern United States[299]. A very fast-growing plant, it starts developing lateral branches from cotyledonary buds 2 - 3 weeks after sowing. Thereafter the main axis and both laterals each produce about one leaf every 2 - 3 days[298, 299 ]. Cultivars selected for once-over harvest or uprooting have retarded branching or almost no branching. Their harvest takes place 21 - 30 days after sowing[296, 299]. Cut and come again harvesting of vegetatively propagated plants or wild plants can start about one month after plant establishment[299]. Flowering commences after 2 - 5 months, but the plant continues to form new leaves and branches[299] ]. Swamp morning glory is a quantitative short-day plant, early flowering being induced by short days of less than 12 hours. Flowering is also stimulated by drought[299]. There are some named varieties[301]. Two main forms exist in cultivation:- A short-lived perennial form grows in very wet soils and water (it has been named Ipomoea aquatica aquatica by some authorities). This form can produce yields ofup to 90 tonnes per hectare in Thailand[300]. An annual creeping form tolerates drier conditions (this has been named Ipomoea aquatica reptans)[300]. Under dryland cultivation, yields per crop can range from 7 - 30 tonnes per hectare. averaging 20 tonnes. In theory one crop can be produced every month leading to a potential yield of around 240 tonnes per hectare in a year[299] produce.

### 8.2.47 Linum hybrids

Perennial Flax

7 tlin 11 cyuc 4 kcak 4 tcan 4 dwat 0.8~m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Linum hybrids is a PERENNIAL growing to  $0.8\,$ m (2ft 7in) by  $0.2\,$ m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 4. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The seed of some strains contain cyanogenic glycosides in the seed though the toxicity is low, especially if the seed is eaten slowly. It becomes more toxic if water is drunk at the same time[76, 222]. The cyanogenic glycosides are also present in other parts of the plant and have caused poisoning to livestock[240]. Contraindicated with a stricture of the oesophagus in no bowel movement conditions and acute gut inflammatory diseases. Contraindicated in pregnancy. Some suggestion it should be avoided with prostate gland diseases [3011].

kcakta Edible Parts: Oil SeedEdible Uses: OilCarbon Farming Solutions - Staple Crop: oil (The term staple crop typically refers to a food that is eaten routinely and accounts

for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta Fibre OilCarbon Farming Solutions - Industrial Crop: fiber (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1].

dwatta Analgesic Antiinflammatory Antitussive Cancer Cardiotonic Demulcent Emollient Expectorant Laxative Nervine Pectoral Resolvent UrinaryLinseed has a long history of medicinal use, its main effects being as a laxative and expectorant that soothes irritated tissues, controls coughing and relieves pain[238]. The seed, or the oil from the seed are normally used[238]. The seed is analgesic, demulcent, emollient, laxative, pectoral and resolvent[4, 9, 21, 46, 165, 218, 240]. The crushed seed makes a very useful poultice in the treatment of ulceration, abscesses and deep-seated inflammations[4, 244]. An infusion of the seed contains a good deal of mucilage and is a valuable domestic remedy for coughs, colds and inflammation of the urinary organs[4]. If the seed is bruised and then eaten straight away, it will swell considerably in the digestive tract and stimulate peristalsis[9] and so is used in the treatment of chronic constipation[238]. The oil in the seed contains 4% L-glutamic acid, which is used to treat mental deficiencies in adults[218]. It also has soothing and lubricating properties, and is used in medicines to soothe tonsillitis, sore throats, coughs, colds, constipation, gravel and stones[4, 244]. When mixed with an equal quantity of lime water it is used to treat burns and scalds 2441. The bark and the leaves are used in the treatment of gonorrhoea[240]. The flowers are cardiotonic and nervine[240]. The plant has a long history of folk use in the treatment of cancer[218]. It has been found to contain various anticancer agents[218]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Linum usitatissimum for constipation, inflammation of the skin (see [302] for critics of commission E)

nrakta Origin: Hypothetical. ksacta Native to temperate and subtropical regions of the world.

# 8.2.48 Oxalis deppei

ron Cross Plant

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Oxalis deppei is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from June to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

pcista The leaves contain oxalic acid, which gives them their sharp flavour. Perfectly all right in small quantities, the leaves should not be eaten in large amounts since oxalic acid can bind up the body's supply of calcium leading to nutritional deficiency. The quantity of oxalic acid will be reduced if the leaves are cooked. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and flowers -raw or cooked[2, 37, 183]. A delicious lemony flavour, the leaves are tender and fairly free of fibres even when they get older[K]. Both the leaves and the flowers make a very refreshing and thirst-quenching munch in the garden, they also make an excellent flavouring in salads[K]. The leaves are available from June to October and the flowers from July to October, or even later in mild autumns[K]. Use in moderation, see notes at top of sheet. Root - raw or cooked[1, 2, 27, 37, 183]. The roots are up to 10cm long and

large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a sandy loam and a very sunny position.[1, 182] Succeeds in any good garden soil that is not excessively limey[11]. This species is fairly lime-tolerant[11, 200]. Plants are very tolerant of drought[260], they succeed in a hot dry position[166] and in poor soils[184]. A fairly wind resistant tree, growing well in maritime areas[49, 166, 182]. Tolerates some salt in the soil[200]. Hardy to about -10°c for short periods[200], it can be grown outdoors in many of the milder areas of the country though, even in Cornwall, it is liable to be cut back to the ground in excessively cold winters[11]. It can resprout from the base[11]. This species is closely related to A. longifolia, but is considered to be hardier and is possibly the hardiest of all the Acacias in Britain[11] Dislikes root disturbance[78]. A very ornamental plant[1]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 8.1.24 Coriaria ruscifolia

tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Coriaria ruscifolia is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant, except the 'fruit' (actually the petals) are highly poisonous[61, 153, 173].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used as a beverage[11, 46, 61, 105, 153]. The pressed fruit yields a very palatable juice, which is drunk raw or fermented into wine[2]. Use with great caution since most parts of the plant, including the seed[173], are very toxic and some reports suggest the fruit should not be used at all[11].

tcanta DyeA black ink is obtained from the leaves, it can also be used as a dye[46, 139, 153]. The bark can also be used, it is rich in tannin.

nrakta Southern S. America, ksacta Not known

propta Seed - sow February/March in a greenhouse[78]. The seed usually germinates in 1 - 3 months at 15°c[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7cm with a heel, luly/August in a frame. Fair percentage[78].

nwatta Prefers a fairly good loamy soil in a sunny sheltered position[11, 164, 200. Succeeds in light shade[200]. This species is not very hardy in Britain, it tolerates temperatures down to about -5°c and succeeds outdoors from Sussex and westwards[200]. There is some confusion over the name of this species, some botanists unite this species with the New Zealand C. sarmentosa whilst others maintain that they are distinct[11, 200]. The roots of plants in this genus bear nitrogen-fixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

### 8.1.25 Coriaria terminalis

tfo2n 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli drutta Coriaria terminalis is a deciduous Shrub growing to  $1.2~\mathrm{m}$  (4ft) by  $2~\mathrm{m}$  (6ft 7in). See above for USDA hardiness, It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The seed may be poisonous[1]. Although we have no more information, it is reasonable to assume that other parts of the plant are also toxic.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used as a beverage[1, 11, 105]. The seed must not be eaten. Use with great caution since most parts of the plant, including the seed, are probably toxic and some reports suggest the fruit should not be used at all. The fruit is about 8mm in diameter[2001.

nrakta E. Asia - Sikkim, Tibet, China. ksacta Thickets and woodland margins, 2000 - 2600 metres in W. China[109]. propta Seed - sow February/March in a greenhouse[78]. The seed usually germinates in 1 - 3 months at 15°c[164].

When they are large enough to handle, prick the seedings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7cm with a heel, July/August in a frame. Fair percentage[78]. Division in the spring.

nwatta Succeeds in any good soil[233], though it prefers a fairly good loamy soil in full sun or light shade[11, 164, 200]. Requires a sunny sheltered position[164, 233]. This species is one of the hardiest members of the genus, tolerating temperatures down to at least -5°c if sheltered from cold winds[200]. Plants are hardy from Sussex westwards[1]. It is hardy at Kew where it fruits annually and resprouts from the base if cut back in severe winters[11, 200]. Plants flower and fruit at the tips of the current years growth and so can produce fruit even if they have been cut to the ground[182, K]. They can fruit well even when young, plants growing with us flowered and fruited in their third year from seed[K]. When well sited, suckers can be produced at some distance from the parent plant[233, K]. The roots of plants in this genus bear nitrogen-fixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

#### 8.1.26 Coriaria sarmentosa

Гuhu

The roots of plants in this genus bear nitrogen-fixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

# 8.1.27 Acacia saligna

Blue-Leaved Wattle, Orange wattle tfo2n 7 tlin 10 cyuc 1 kcak 5 tcan 0 dwat 6 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hjonli

drutta Acacia saligna is an evergreen Shrub growing to 6 m (19ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: GumFlowers - cooked[144]. Rich in pollen, they are often used in fritters. The damaged bark exudes copious amounts of a very acidic gum that seems to show promise for use in pickles and other acidic foodstuffs[269].

tcanta Fodder Fuel Gum Hedge Hedge Soil stabilization TanninA yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. On a 10% moisture basis, the bark contains 21.5% tannin[223]. A fast growing plant, it is used for reclaiming eroded hillsides and wastelands and for stabilizing drift sands as well as for fuel. This is one of the best woody species for binding moving sand. It is useful for windbreaks, amenity plantings, beautification projects, and roadside stabilization in semiarid regions[269]. Plants are heavily armed with thorns and make a good screen or hedge in warm temperate areas[200].

nrakta Australia - W. Australia . ksacta Sandy, coastal plains, but also in swampy sites and riverbanks to small, rocky hills (often granitic), on poor acid or calcareous sands, under the most dry and adverse soil conditions[269].

propta Seed best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Agroforestry Services: Nitrogen Agroforestry Services: Windbreak Fodder: Bank Fodder: Pod Industrial Crop: Biomass Industrial Crop: Gum Industrial Crop: Tannin Management: Coppice Management: Standard Minor Global CropPrefers a sandy loam and a very sunny position[1, 260], though it also succeeds in dry soils and is tolerant of wet conditions[260]. Succeeds in any good garden soil that is not excessively limey[11, 260]. Most species become chlorotic on limey soils[200]. Tolerates salt-laden winds and maritime exposure[200]. An extremely rugged tree, it grows rapidly, is adaptable to barren slopes, derelict land, and exceptionally arid conditions[269]. Reported from the Australian Centre of Diversity, orange wattle, or cvs thereof, is

reported to tolerate alkalinity, drought, heavy soil, poor soil, salinity, salt spray, sand, shade, slope, waterlogging, and weeds[269]. Trees are not very hardy outdoors in Britain, they tolerate occasional temperatures down to between -5 and -10°c, but even in the mildest areas of the country they are likely to be killed in excessively harsh winters[11]. Plants spread by means of suckers[200] and trees that have been killed in cold weather can sometimes regrow from the roots. Regrowth of established bushes is so good that Acacia saligna can be completely grazed off without harming the plants[269]. Because of its hardiness and profuse reproductive abilities. Acacia saligna has become a serious menace in parts of South Africa by invading and displacing indigenous vegetation[269]. It infests water courses (sometimes decreasing the water available for irrigation), and has proved difficult to eradicate[269]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. It also has a symbiotic relationship with ants[200].

# 8.1.28 Acacia verticillata

Prickly Moses

tfo2n 7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Acacia verticillata is an evergeen Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: Flowers - cooked[144]. Rich in pollen, they are often used in fritters.

tcanta Hedge HedgeA yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. Plants are heavily armed with thorns and make a good screen or hedge in warm temperate areas[200].

nrakta Australia - New South Wales, Tasmania. ksacta Widespread in saline and submontane tracts[286].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a sandy loam and a very sunny position[1]. Another report says that it needs some shade[260]. Succeeds in dry soils. Succeeds in any good garden soil that is not excessively limey[11]. Most members of this genus become chlorotic on limey soils[200]. Trees are not very hardy outdoors in Britain, they tolerate occasional temperatures down to between -5 and -10°c, but even in the mildest areas of the country they are likely to be killed in excessively harsh winters[11]. A tree in Cornwall reached a height and width of 6 metres[11]. A fast-growing tree, frequently flowering in a few years from seed[200]. This species is notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

dwatta Antibacterial Antifungal Antipyretic Aromatic Cancer Carminative Diaphoretic Febrifuge Refrigerant StomachicKorean mint is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. Considered to be a "warming" herb, it is used in situations where there is "dampness" within the digestive system, resulting in poor digestion and reduced vitality[254]. The leaves and stems are antibacterial, antifungal, aromatic, carminative, diaphoretic, febrifuge and stomachic[147, 176, 218, 238, 2791. They are used internally to improve the appetite and strengthen the digestive system[238], they relieve symptoms such as abdominal bloating, indigestion, nausea and vomiting[254]. They are also used to treat morning sickness[254]. The leaves are also used in the treatment of chest congestion, diarrhoea and headaches[218]. An infusion of the leaves is used in the treatment of angina pains[222]. The plant is used as a folk remedy for cancer, extracts of the plant have shown anticancer activity[218].

nrakta E. Asia - China, Japan, Korea, Siberia ksacta Grassy places in mountains, especially by streams, and in valleys all over Japan[58]. Sunny, more or less stony meadows from the lowlands to elevations of 1500 metres

propta Seed - sow spring in a greenhouse and only just cover the seed. The seed usually germinates in 1 · 3 months at 13°c(133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant out in late spring or early summer[K]. Division in spring. Fairly simple, if large divisions are used it is possible to plant them straight out into their permanent positions. Basal cuttings of young shoots in spring[111]. Harvest the young shoots when they are about 10 · 15cm tall and pot them up in a lightly shaded position in a greenhouse. They should root within 3 weeks and can be planted out in the summer or following spring.

nwatta Prefers a sunny sheltered position and a well-drained soil[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The flowers are very attractive to bees[244].

### 8.2.45 Canna indica

Indian Shot

7 tlin 10 cyuc 4 kcak 3 tcan 2 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Canna indica is a PERENNIAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to October, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit RootEdible Uses: Root -cooked. The source of 'canna starrch', used as an arrowroot[97, 177]. The arrowroot is obtained by rasping the root to a pulp, then washing and straining to get rid of the fibres[2]. The very young tubers are eaten cooked, they are sweet but fibrousy[97, K]. Roots contain about 25% starch[61]. There is one report that this plant has an edible fruit[177] but this is somewhat dubious, the fruit is a dry capsule containing the very hard seeds[K].

tcanta Dye Fibre Insecticide PaperThe plant yields a fibre - from the stem? - it is a jute substitute[114]. A fibre obtained from the leaves is used for making paper[189]. The leaves are harvested in late summer after the plant has flowered, they are scraped to remove the outer skin and are then soaked in water for 2 hours prior to cooking. The fibres are cooked for 24 hours with lye and then beaten in a blender. They make a light tan brown paper[189]. A purple dye is obtained from the seed[114]. Smoke from the burning leaves is said to be insecticidal[218].

dwatta Demulcent Diaphoretic Diuretic VD Women's complaintsThe plant is used in the treatment of women's complaints[218]. A decoction of the root with fermented rice is used in the treatment of gonorrhoea and amenorrhoea[218]. The plant is also considered to be demulcent, diaphoretic and diuretic[218].

nrakta S. America. W. Indies. Locally naturalized in the warmest parts of S. Europe[50]. ksacta Original habitat is obscure, but it is found by the coast and in temperate valleys of the Andes[97].

propta Seed - pre-soak for 24 hours in warm water and sow February/March in a warm greenhouse at  $20^{\circ}$ c[1, 138]. Plant the seeds  $2 \cdot 5$ cm deep in individual pots[1]. Scarifying the seed can speed germination, especially if the seed has not swollen after being soaked[124, K]. The seed usually germinates in  $3 \cdot 9$  weeks[138]. Grow the plants on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of the root clump as the plant comes into growth in the spring. Each portion must have at least one growing point. Pot up the divisions and grow them on in the greenhouse until they are well established and then plant them out in the summer. Root cuttings.

nwatta Requires a deep rich well-drained soil in a sunny position[200]. The plant has large leaves and dislikes windy conditions since this can tear the leaves to shreds[200]. This species is probably hardy in the mildest areas of Britain but even then it should be given a good mulch if left in the ground overwinter[1, 200]. Plants have survived temperatures down to about -5°c overwinter with us[K]. This species is often grown as a summer bedding plant in Britain, especially in sub-tropical bedding schemes. In colder areas of the country the tubers can be harvested in late autumn after the top growth has been killed back by frost and stored over winter. They should be kept in a cool but frost-free place covered in moist soil or leaves[1]. Plants are cultivated for their edible root in the Tropics. Slugs love the young growth in spring and can cause serious damage to plants[233].

### 8.2.46 Ipomoea aquatica

Kangkong, Swamp Morning Glory 7 tlin 12 cyuc 4 kcak 0 tcan 2 dwat 0.5 m hkuc htut cyutli tcuphja7nhs6s hwicli hrasjlutnyikfrip hpa7tli frusflatpriklwis hpa7tmwatli fyif hjonli

drutta Ipomoea aquatica is an evergreen Annual/Perennial growing to 0.5 m (1ft 8in) by 0.3 m (1ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. The flowers are pollinated by Bees, Butterflies. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water

pcista Accumulation of heavy metals in the plant has been reported in Asia, mainly because the plants are often grown in polluted water[299 ].

kcakta Edible Parts: Leaves Root ShootsEdible Uses: Leaves and young shoots - raw or cooked[296], 298]. The tasty leaves are produced all year round[296]. The youngest shoot tips can be added to salads, older leaves are cooked and make a mild-flavoured spinach[298]. The leaves can be stir-fried, steamed, boiled for a few minutes or lightly fried in oil and eaten in various dishes. They are often mixed with hot peppers and garlic and prepared with a savoury dish[296]. Very nutritious, the leaves are a good source of protein as well as providing good quantities of vitamin A, iron, calcium and phosphorus[298]. Roots - occasionally cooked and eaten[29]. 301].

dwatta Antidote Antihaemorrhoidal Antitussive Febrifuge Hypoglycaemic Laxative Laxative Poultice Skin TonicThe young shoots are mildly laxative and are used by diabetic patients[272]. A decoction of the leaves is used to treat coughs[272]. The fried leaves are eaten to cool down a fever[310]. The crushed leaves are applied as a poultice on sores and boils[310, 348]. A paste made from the buds is used to treat ringworm[272, 299]. The roots are laxative, tonic and antidote[310]. They are used in the treatment of opium or arsenic poisoning, and also to counter the effects of drinking unhealthy water[310]. A decoction of the roots is used as a wash against haemorrhoids[310, 348]. The plant has shown oral hypoglycaemic activity in tests with diabetic humans; it was shown that an aqueous leaf extract can be as effective as tolbutamide in reducing blood glucose levels[299].

drutta Polymnia edulis is a PERENNIAL growing to 1 m trees[K]. (3ft 3in) by 0.6 m (2ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Leaves RootEdible Uses: Drink SweetenerRoot - raw or cooked[1, 22, 46, 61]. When first harvested, the root can taste somewhat starchy[K], but it soon becomes sweet, crisp and juicy and is delicious eaten raw[196, K]. The flavour is further improved by exposure to the sun although some of the crispness will be lost[97, 183. K1. The root can be eaten like a fruit or diced and added to salads[183]. The skin has a somewhat resinous taste so it is usually removed[196]. The cooked root retains is sweetness and crispness[196]. Individual roots can weigh up to 500g[196]. The nutritional value is low because the root contains a high quantity of inulin, a carbohydrate that the human body cannot utilize[196]. The grated pulp of the root is squeezed through a cloth to yield a sweet refreshing drink[183]. This juice can be concentrated to form dark brown blocks of sugar called 'chancaca' in S. America[183, 196]. Leaves and stems - cooked as a vegetable[183, 196]. They contain 11 - 17% protein, dry weight[196].

nrakta S. America - Colombia, Ecuador, Peru in the Andes. ksacta Not known

propta Seed - sow mid winter in a warm greenhouse and only just cover the seed[1]. Prick out the seedlings into individual pots as soon as they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Plants do not usually produce flowers in Britain and therefore seed has to be obtained from other countries[K]. Division in autumn. The plant forms 2 distinct types of tuber. Large tubers, usually on thin roots 2 - 5cm long, are used as storage organs and do not have the capacity to form new shoots. These are the tubers that are usually eaten. Smaller tubers are formed in a cluster around the stem. These form the shoots for the following year's growth and so are the ones that should be stored. Dig up the plants in the autumn once the top growth has been cut down by frost. Remove the large tubers for food, cut the main stems back to about 10cm long and store these stems with their cluster of small tubers in a cool frost-free place. Do not let them dry out. Pot them up in early spring in a greenhouse. When they come into active growth divide each cluster into individual shoots with their tubers attached and repot these. Plant them out in late spring after the last expected frosts[K]. Cuttings of basal shoots in early spring in a warm greenhouse[1]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta For best results, this plant requires a warm position in a deep rich soil[1], though it survives even when growing in poor soils[196]. Plants are fast-growing[196]. In S. America, they succeed in areas with annual rainfall varying from 900 - 3500mm[196], though are likely to succeed with less rain in temperate zones. The yacon is cultivated for its edible tuber in the Andes, and is sometimes used in sub-tropical summer bedding schemes in Britain, though it is not very hardy[1]. The top growth is killed back by frost but the tubers can tolerate at least light frosts[196]. Plants are unaffected by day-length and so can produce good yields of roots in temperate zones[196]. One report says that plants take 6 - 7 months to produce a crop from planting out[196], though on our Cornwall trial ground they have cropped guite well with a 5 month growing period[K]. The roots are brittle and must be harvested with care to avoid damage[196]. Yields of 38 tonnes per hectare have been recorded in South America[196], whilst yields of over 2 kilos per plant have been achieved outdoors in Cornwall[K]. The harvested roots can be stored for several months[196]. Plants have not been selected for flavour or yield, some roots can be exceedingly sweet whilst others are fairly bland[196]. Plants might be useful in agroforestry because they succeed under trees[196], though in the relatively sunless climes of Britain the plants are not likely to do well in the shade of

## 8.2.43 Physalis ixocarpa

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Physalis ixocarpa is a ANNUAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista All parts of the plant, except the fruit, are poisonous[19, 65].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 38, 61]. The fruit is a berry that is 2.5cm or more in diameter[200]. When not fully ripe, the fruit can be cooked and used in curries, sauces, soups, stews etc[183]. A delicious flavouring when used like a tomato and added to soups, stews etc[K]. The fully ripe fruit is sweeter and can be eaten out of hand, added to salads or used in pies, preserves etc[183]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be eaten. The fruit can be stored for up to a year if picked before they are fully ripe and left inside their calyx.

nrakta Southern and Central N. America as far north as southern Quebec. ksacta Waste places[43].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170].

nwatta Succeeds in any well-drained soil in full sun or light shade[200]. Prefers a rich light soil[33, 38]. Tolerates hot dry weather[160]. One report suggests that the plant is a perennial but, if this is true, it is not winter hardy in Britain though it can be cultivated as an annual for its edible fruit in much the same way that tomatoes are grown[34]. There are some named varieties[183]. Some botanists unite this species with P. philadelphica[50], saying that it arose from P. philadelphica through cultivation. A slow growing plant[160]. Insect resistant[160].

## 8.2.44 Agastache rugosa

7 tlin 10 cyuc 4 kcak 2 tcan 3 dwat 1 m hkuc

htut cyutli kyuctcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Agastache rugosa is a PERENNIAL growing to 1 m (3ft 3in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to September, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Condiment TeaYoung leaves - raw or cooked[177]. A strong aniselike fragrance, they are normally used as a flavouring[183] or as an addition to the salad bowl[238]. We find them a bit coarse and too strong for use as a salad[K]. The leaves can be used as a tea substitute[183]. A pleasant flavour[238]. The seed is possibly edible[177]. No further details. The seed certainly should not be poisonous, but it is very small and its use would be very fiddly[K].

tcanta Attracts wildlife. The flowers are very attractive to bees[244].

# 8.1.29 Acacia paradoxa

Kangaroo Thorn, Paradox acacia tfo2n 7 tlin 10 cvuc 1 kcak 2 tcan 0 dwat 5 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Acacia paradoxa is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FlowersEdible Uses: Flowers cooked[144]. Rich in pollen, they are often used in fritters.

tcanta Hedge HedgeA vellow dve is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. Plants are heavily armed with thorns and make a good screen or hedge in warm temperate areas[200].

nrakta Australia - New South Wales, Victoria. ksacta Grows in dry sclerophyl forests[265].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta A very tough plant that stands both wet and drought well, it is lime-tolerant and also withstands saltladen winds[260]. Prefers a sandy loam and a very sunny position[1]. Succeeds in dry soils. Succeeds in any good garden soil that is not excessively limey[11]. Most members of this genus become chlorotic when grown on limey soils [200]. Trees are not very hardy outdoors in Britain, they tolerate occasional temperatures down to between -5 and -10°c, but even in the mildest areas of the country they are likely to be killed in excessively harsh winters[11]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 8.1.30 Acacia podalyriifolia

Queensland Silver Wattle, Pearl wattle tfo2n 7 tlin 10 cvuc 1 kcak 3 tcan 0 dwat 3 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hionli

drutta Acacia podalyriifolia is an evergreen Tree growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers cooked[144]. Rich in pollen, they are often used in fritters[183]. The flowers have a delicate sweet perfume[245].

tcanta Dye Soil stabilizationA yellow dye is obtained from the flowers[168]. A green dye is obtained from the seed pods[168]. When planted on steep slopes or other fragile soil systems, the extensive root system of this plant binds the soil together and helps to prevent erosion[200].

nrakta Australia - New South Wales, Oueensland, ksacta In the N of its range it is more or less restricted to sandstone hills in open Eucalyptus forest, but in the south it occurs on rocks of various types[286].

propta Seed - best sown as soon as it is ripe in a sunny position in a warm greenhouse[1]. Stored seed should be scarified, pre-soaked for 12 hours in warm water and then sown in a warm greenhouse in March. The seed germinates in 3 - 4 weeks at 25°c[133]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in a sunny position in the greenhouse for their first winter. Plant them out in late spring or early summer, after the last expected frosts, and consider giving them some protection from the cold for their first winter outdoors. Cuttings of half-ripe wood with a heel, July/August in individual pots in a frame[78]. Overwinter in a greenhouse for the first winter and plant out in their permanent positions in late spring or early summer. Fair percentage[78].

nwatta Prefers a sandy loam and a very sunny position[1]. Succeeds in any good garden soil that is not excessively limey[11, 167]. Many members of this genus become chlorotic on limey soils[200]. Can succeed in a hot dry position in a mixed border[166]. Plants are not very cold-hardy. tolerating temperatures down to about -3°c[260]. They succeed outdoors in the mildest areas of Britain, though even there they can be cut back to the ground in severe winters[1, 11]. A very ornamental tree[1], it can be pruned back hard after flowering in order to induce good flowering the following year[260]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

# 8.1.31 Wisteria iaponica

tfo2n 7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hna7tmwatli xre7t hionli

drutta Wisteria japonica is a deciduous Climber. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

pcista The seed of all members of this genus is poisonous[200].

kcakta Edible Parts: Leaves SeedEdible Uses: Seed cooked[105]. A famine food, used when all else fails[177]. Some caution is advised, see the notes on toxicity at the top of the page. Young leaves - cooked[105]. A famine food, they are only used when all else fails[177].

nrakta E. Asia - Japan, Korea. ksacta Clambering over cliffs and trees on woodland edges and in thickets in lowland, C. and S. Japan.

propta The seed does not exhibit any dormancy habits. It can be sown as soon as it is ripe in a cold frame and should germinate in the spring. Pre-soak stored seed for 24 hours in warm water and then sow in a greenhouse in early spring. The seed can also be sown in an outdoor seedbed in late spring[126]. Germination should take place in the first spring, though it can sometimes be delayed for another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in late spring or early summer. Plants are very slow from seed and can take up to 20 years to come into flower[200]. Basal cuttings of side-shoots in early to mid summer in a frame[200]. Take the cuttings as soon as the new growth has hardened sufficiently, each cutting should have 2 - 3 leaves[249]. It can also help to remove a shallow slice of bark from the bottom 15mm of the cutting to expose extra cambium, since this will encourage more callusing and better rooting[249]. When kept in a mist frame with a bottom heat of 27 - 30°c, they will root within 4 weeks and produce well-established plants by the autumn[249]. Layering in spring. Simply lay any convenient long shoot along the ground and cover it with a shallow layer of soil. The shoot will readily produce roots at intervals along the stem. When these are well formed, the shoot can be divided up into a number of plants. These should be potted up and kept in a lightly shaded position in a greenhouse until well established and can then be planted out as required.

nwatta Prefers a good loamy soil in a sunny south or south-west facing position, sheltered from cold winds and from early morning sun on frosty mornings[11, 200]. Plants can become chlorotic on alkaline soils[200]. A soil that is too rich results in excessive foliage at the expense of flowering[200]. This species is not hardy in the colder areas of the country[200]. There is some confusion over the correct name of this species, many authorities referring it to a separate genus as Millettia japonica (Sieb. and Zucc.)A.Grav.[249]. Plants can take a few years to settle down after planting out[219]. Too much shade or too rich a soil are normally the culprits, some form of root restriction can be beneficial[219]. A climbing plant, attaching itself to branches or whatever by twining in a clockwise direction[249]. Plants in this genus are notably susceptible to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. The plants also form a symbiotic relationship with a mycorrhizal fungus which makes more water, phosphorus and other minerals available to the plants[249].

## 8.1.32 Sophora mollis

tfo2n 7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sophora mollis is a deciduous Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista The plant contains cytosine, which resembles nicotine and is similarly toxic[238].

kcakta Edible Parts: LeavesEdible Uses: One report says that the plant has edible qualities but does not say what part of the plant is eaten[145].

tcanta Miscellany WoodThe seed is considered useful for destroying vermin[240]. Wood - hard. Mainly used as a fuel[146, 158].

nrakta E. Asia - Himalayas. ksacta Rocks in dry valleys, 1200 - 2000 metres[184]. Often gregarious on hillsides[146].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Pre-soak stored seed for 12 hours in hot (not hotiling) water and sow in late winter in a greenhouse[78]. Prick out the seedlings as soon as they are large enough to handle into individual pots in the greenhouse, and grow them on for 2 years under protected conditions. Plant them out into their permanent positions in early summer of their third year. Cuttings of young shoots with a heel, July/August in a frame[11]. Air-layering[200].

nwatta Succeeds in a well-drained moderately fertile dry soil in full sun[184]. Requires a hot dry position, succeeding outdoors only in the warmer areas of the country[182] where its wood will be better ripened and more able to withstand winter cold[219]. Hardy to about -15°c[184]. Plants should be container-grown and planted out whilst young, older plants do not transplant well[219]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

### 8.1.33 Erythrina herbacea

Cardinal Spear, Redcardinal

tfo2n 7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Erythrina herbacea is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The plant contains alkaloids that have powerful narcotic and purgative effects[200]. The seeds contain numerous toxic alkaloids, including erysodine and erysopine. They have an action similar to curare and have been used as a rat poison[274].

kcakta Edible Parts: Flowers LeavesEdible Uses: Flowers - cooked. An acceptable vegetable when boiled[183]. Some caution is advised, see the notes above on toxicity. Young leaves - occasionally cooked and eaten[183].

dwatta Antiemetic Diuretic Narcotic Purgative TonicThe plant is narcotic and purgative[200]. A cold infusion of the root has been used to treat bowel pain in women[257]. A decoction of the roots or berries has been used to treat nausea, constipation and blocked urination[257]. A decoction of the 'beans' or inner bark has been used as a body rub and steam for numb, painful limbs and joints[257]. A decoction of the leaves has been used as a general tonic[257].

nrakta South-eastern N. America - North Carolina to Texas. ksacta Sandy soils in hummocks, the coastal plain and pinelands[229].

propta Seed - pre-soak for 12 hours in warm water and sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-righ wood, July/August in a frame[200]. Overwinter in a greenhouse and plant out in late spring or early summer. Heeled cuttings of young growth in the spring in a frame[200]. Overwinter in a greenhouse and plant out in late spring or early summer.

nwatta Requires a moderately fertile well-drained soil in a very sunny position[200]. Best if given the protection of an east, south or south-west facing wall[200]. Becoming a tree in the south of its range, this species is shrubby or even herbaceous towards the limits of its northerly range[229]. It is not very hardy outdoors in Britain though the rootstock can tolerate temperatures down to about -10°c provided the stem bases are thickly mulched with organic matter such as leaf litter or sawdust and covered with bracken[200]. Alternatively, the roots can be lifted in the autumn and stored in a cool frost-free place, replanting in the spring. Plants take 3 - 4 years to flower from seed[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby [200].

# 8.1.34 Indigofera hebepetala

tfo2n 7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Indigofera hebepetala is a deciduous Shrub growing to 1.2 m (4th). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Flowers SeedpodEdible Uses: The flowers and tender fruits (probably the immature seed pods[K]) are coked as a vegetable or are pickled[272].

tcanta FuelUsed as a fuel[158].

nrakta E. Asia - N.W. Himalayas. ksacta Shady places, 2100 - 3000 metres in Jaunsar, Uttar Pradesh[158]. Open places at elevations of 1600 - 2800 metres in Nepal[272].

propta Pre-soak the seed for 12 hours in warm water and sow February in a warm greenhouse. The germination can be variable. Prick out the seedlings when large enough to handle and overwinter the young plants in a greenhouse for the first winter, planting out in late spring or early summer after the last expected frosts[78]. Cuttings of half-ripe wood, 5 - 8cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Overwinter the young plants in a greenhouse for the first winter and plant out in late spring or early summer[11]. Root cuttings 3cm long in December. Good percentage[78]. Suckers. Remove

well in exposed positions[49]. Plants growing in a very exposed position on our trial grounds in Cornwall are flowering and fruiting well, they are rather slow growing but are looking very happy and healthy[K]. A very ornamental plant, it is hardy to about -15°c[184]. A good bee plant[108]. Birds love this fruit and will happily eat it all before it is fully ripe[K]. If you want to experience the fully ripe fruit then it might be necessary to find ways of keep the birds off the plants[K]. Hybridizes freely with other members of this genus[1]. Plants can be pruned back quite severely, they resprout well from the base[200]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native.

# 8.2.40 Tropaeolum tuberosum

Δnii

7 tlin 10 cyuc 4 kcak 2 tcan 2 dwat 2 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Tropaeolum tuberosum is a PERENNIAL CLIMBER growing to 2 m (6ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from June to October, and the seeds ripen from June to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Tubers - cooked[1, 2]. A peppery flavour, it is rather unpleasant to many tastes[27, 34, 37]. The flavour can be improved somewhat by freezing the tubers after they have been cooked, they are then considered to be a delicacy by many people[183]. We have also noticed an improvement in the flavour if the tubers are harvested after they have been frosted, though if the frost is too heavy they can damage the tubers[K]. Other reports suggest half-drying the tubers before use[27, 34, 97, 183]. The tubers can be up to 10cm long and 5cm thick[260]. They are high in vitamin C[196]. The dried tuber contains up to 16% protein[196]. Leaves - raw or cooked as a vegetable[183, 196]. Flowers - raw[183, 196].

tcanta RepellentThe growing plant is very resistant to diseases and insects, it contains nematocidal, bactericidal and insecticidal compounds[196].

dwatta Anaphrodisiac Vitamin CThe tuber is considered to be an anaphrodisiac in the Andes, reducing sexual desire. Many men, therefore, refuse to eat it, whilst recommending it for use by women![196]. Clinical trials have indicated a reduction of up to 45% in some male hormones when the tuber forms a considerable part of the diet, but no loss in fertility has been observed[196].

nrakta S. America - Peru, Bolivia. ksacta Mountain slopes and valleys[90]. Moist wooded scrubby areas around 3000 metres in Peru and Ecuador[196].

propta Seed - sow early spring in a greenhouse. Prick the seedlings out into individual pots once they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer, after the last expected frosts. So far we have been unable to obtain seed from plants grown in this country. Division of the tubers in the autumn or spring. In cold winter areas the tubers can be harvested in the autumn after top-growth has died down and they can then be stored in a cool frost-free position until planting them out in the spring. Cuttings of basal stems in the spring[200]. Pot them up into individual pots and place them in light shade in a frame until they are established. Plant out in early summer.

nwatta Requires a well-drained lime-free soil in a warm sunny position[1, 33, 200]. Grows best with its roots in the shade and top growth in the sun[202]. Plants can become dormant in hot dry summers[90]. Grows best in a pH range from 5.3 to 7.5[196]. Prefers a turfy loam or a sandy peaty roil[1]. This species is not very hardy when grown outdoors in Britain. The top growth will survive light frosts, whilst the tubers, if well mulched, will survive to at least  $-5^{\circ}c[1, 200]$ . Anu is sensitive to the number of hours of daylight in a day and most forms will not flower or form new tubers until late in the season (from September), so a mild autumn is required for good yields[33]. The variety 'Ken Aslet', however, is not affected by daylight hours, it flowers from June to October and

produces larger tubers than the species from mid-summer onwards[90, 104, 200]. The tubers are formed very near the surface of the soil[90] and so will require some protection, such as a mulch, if they are to be left in the ground over the winter[K]. The tubers can also be stored in a cool dry frost-free place over the winter and then planted out in April[200]. Long cultivated in the Andes for its edible root, there are many named varieties[2, 61, 90, 104, 196]. A potentially very high-yielding species, individual plants can produce up to 4 kilos of tubers - yields of 50 tonnes per hectare are possible[196]. A climbing plant, it supports itself by twisting its leaf stalks around other plants etc[219]. The caterpillars of the cabbage white butterfly can be a nuisance and often cause considerable damage to the leaves[219].

# 8.2.41 Oryza hybrids

Perennial Rice

7 tlin 12 cvuc 4 kcak 2 tcan 2 dwat 2 m hkuc

htut cyutli tcuphja7nhs6s hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Oryza hybrids is a PERENNIAL growing to 2 m (6ft) by 0.3 m (1ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: SeedEdible Uses: Carbon Farming Solutions - Staple Crop: balanced carb (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1]. Under development as new cereal, annual O. sativa crossed with its perennial ancestors, O. longistaminata and O. rufipogon.

tcanta The straw, which may attain considerable length if the plant has grown in flood water, is valued for thatching[299 , 332 ]. Because they are a source of resistance to or tolerance of biotic and abiotic stresses, the most important use of the various species of wild rice is probably in breeding programmes to improve the species of cultivated rice[1040  $\,$ 

dwatta UrinaryRice is a nutritive, soothing, tonic herb that is diuretic, reduces lactation, improves digestion and controls sweating[238 ]. The seeds are taken internally in the treatment of urinary dysfunction[238 ]. The seeds, or the germinated seeds, are taken to treat excessive lactation[238 ]. The grains desired in the seeds are used to treat poor appetite, indigestion abdominal discomfort and bloating[238 ]. The grains are often cooked with herbs to make a medicinal gruel[238 ]. The rhizome is taken internally in the treatment of night sweats, especially in cases of tuberculosis and chronic pneumonia[238 ]. The rhizomes are harvested at the end of the growing season and dried for use in decoctions[238 ].

nrakta Origin: hypothetical hybrid. ksacta Various depending on the species.

propta Seed. The seed of wild rice less than 12 months old often exhibits strong dormancy, which implies (though this has not been established) that the seed retains its viability for a considerable period[1040]. Heat treatment is generally effective in breaking dormancy - alternating temperatures between 34°c for 16 hours then 11°c for 8 hours is usually effective, though the time taken varies between species[1040]. Surface sow the seed in light shade and do not allow to dry out. Seed should germinate within 7 days at 30°c[1040]. Prick out 2 - 3 seedlings into individual pots when large enough to handle and, after a few days, move to a sunny position. Grow on until large enough to plant out. Division.

nwatta Staple Crop: Balanced carb Under DevelopmentClimate: cold temperate to tropical, tropical highlands. Humidity: humid, aquatic. Succeeds in full sun and in moderate shade[1040]. Requires a wet soil or shallow water[1040].

# 8.2.42 Polymnia edulis

Yacon Strawberry

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 1 m hkuc htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

name. Any pruning is best carried out in the spring[219]. This species is notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

#### 8.2.38 Berberis asiatica

Chutro, Rasanjan (Nep); marpyashi (Newa); Daruharidra, Darbi (Sans)

7 tlin 10 cyuc 4 kcak 2 tcan 3 dwat 3.5 m hkuc pcimhmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis asiatica is an evergreen Shrub growing to 3.5 m (11ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Édible Parts: FruitEdible Uses: Fruit - raw or dried and used like raisins[2, 3, 51, 105, 158, 183]. This species is said to make the best Indian raisins[183]. Fully ripe fruits are fairly juicy with a pleasantly acid flavour, though there are rather a lot of seeds[K]. The fruit is abundantly produced in Britain[2]. The fruit is about 8mm long[200].

tcanta DyeA yellow dye is obtained from the roots and stems[272]. The spiny branches are used to make fencing around fields in Nepal[272].

dwatta Antibacterial Cancer Dysentery Laxative Odontalgic Ophthalmic TonicThe roots are used in treating ulcers. urethral discharges, ophthalmia, jaundice, fevers etc[240]. The roots contain 2.1% berbering, the stems 1.3%[240]. The bark and wood are crushed in Nepal then boiled in water, strained and the liquid evaporated until a viscous mass is obtained. This is antibacterial, laxative and tonic[272]. It is taken internally to treat fevers and is used externally to treat conjuctivitis and other inflammations of the eyes[272]. Tender leaf buds are chewed and held against affected teeth for 15 minutes to treat dental caries[272]. The fruit is cooling and laxative[272]. Berberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

nrakta E. Asia - Himalayas (Nepal) ksacta Shrubberies, grassy and rocky slopes up to 2500 metres[51]. Found in heavy shade, on north-facing slopes[67] and on open hillsides in the drier areas[146].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel. October/November in a frame[78]

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Plants are often found growing in dense shade in the wild[67]. Plants are generally very hardy and fruit abundantly in

Britain[2]. They grow very well in Cornwall[11, 59]. In colder areas of the country they are apt to be cut to the ground in severe winters, though they resprout well from the base[1, 67]. Hybridizes freely with other members of this genus[1]. This species is often offered under the names of B. chitria or B. glaucocarpa[200]. Plants can be pruned back quite severely, they resprout well from the base[200].

### 8.2.39 Berberis darwinii

Darwin's Barberry, Darwin's berberis 7 tlin 9 cyuc 4 kcak 3 tcan 2 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli frusflatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis darwini is an evergreen Shrub growing to 3 m (9ft) by 3.5 m (11ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Paris: FruitEdible Uses: Fruit - raw or cooked and used in preserves[2, 3, 105, 183]. An acid but very pleasant flavour, children seem particularly fond of the fruit[2, K]. When fully ripe, the fruit loses most of its acidity and makes very pleasant eating[K]. Unfortunately there is a lot of seed compared to the amount of flesh and this does detract somewhat from the pleasure of eating it[K]. The fruit goes very well raw in a muesli or cooked in a porridge[K]. The fruits are about 7mm long[200].

tcanta Dye Hedge HedgePlants are very amenable to trimming and can be used as a formal hedge. They also make a very good informal hedge, their long arching branches looking especially attractive when in flower or bearing fruit. The plants tolerate maritime exposure though they are slow growing[75]. A yellow dye is obtained from the root and bark[46, 61].

dwatta Antibacterial Cancer Dysentery Tonic Urinary-The root bark is tonic[46, 61]. Berberine, universally present in all parts of Berberis species but especially the rhizomes, has marked antibacterial effects, especially upon the urinary system. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

nrakta S. America - S. Argentina, S. Chile. ksacta Moist shady woodland in the Patagonian mountains [67].

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78].

nwatta Landscape Uses:Border, Erosion control, Pest tolerant, Hedge, Massing, Seashore. Prefers a warm moist loamy soil in full sun or light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds on chalky soils if other conditions are suitable but prefers an acid soil[184]. Dislikes exposure to strong winds according to one report[11], whilst others say that it is a very wind hardy plant, tolerating maritime exposure[49, 75, 200]. Does not flower

them in the dormant season, preferably towards the end of winter, and plant out into their permanent positions.

nwatta Requires a light or medium well-drained soil and a sunny position[11, 200]. Succeeds on chalk[11]. Except in warm sheltered gardens the plant is cut back to the ground by winter cold, though it usually resprouts from the base and flowers in late summer[182]. Plants grow much taller in milder climates where they do not get cut back by winter cold[1]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.35 Trifolium subterraneum

Subterranean Clover

tfo2n 7 tlin 10 cyuc 1 kcak 4 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Trifolium subterraneum is a ANNUAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked.

tcanta Green manureThis plant can be grown as a ground cover green manure under tomatoes in the greenhouse. The seed should be sown before planting the tomatoes[87]. It can also be sown under soft fruit and cut once or twice in the summer[87]. Nitrogen Fixer.

nrakta Southern and western Europe, including Britain. ksacta Sandy and gravelly pastures, also on cliff tops, avoiding acid soils and shady positions[17].

propta Pre-soak the seed for 12 hours in warm water and then sow in spring in situ. If the seed is in short supply it might be better to sow it in pots in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in late spring.

nwatta Succeeds in a moist, well-drained circum-neutral soil in full sun[200]. Succeeds in poor soils. Plants are partially winter hardy[87]. After flowering, the fruiting head grows into the ground, thereby planting the seed. This species grows well in an apple orchard, the trees will produce tastier fruit that stores better[201]. It should not be grown with camellias or gooseberries, however, because it harbours a mite that can cause fruit drop in the gooseberries and premature budding in the camellias[201]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Buttercups growing nearby depress the growth of the nitrogen bacteria by means of a root exudate[201]. When removing plant remains at the end of the growing season, it is best to only remove the aerial parts of the plant, leaving the roots in the ground to decay and release their nitrogen.

### 8.1.36 Alnus nitida

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 30 m hkuc hmimhtut cyutli kyuctcuphja7n hwicli hyisjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Alnus nitida is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. It can fix Nitrogen. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry moist or wet soil.

tcanta Dye WoodTannin is obtained from the bark, it is used in dyeing[146, 158, 272]. Wood - soft, even grained, hard to cut. Used for construction and furniture[146, 158, 272].

dwatta AstringentA decoction of the bark is applied externally to treat swellings and body pains[272].

nrakta E. Asia - Himalayas. ksacta By rivers and streams, 600 - 1200 metres, occasionally to 2700 metres[146].

propta Seed - best sown in a cold frame as soon as it is ripe and only just covered[200]. Spring sown seed should also germinate successfully so long as it is not covered[200, K]. The seed should germinate in the spring as the weather warms up. When large enough to handle, prick the seedlings out into individual pots. If growth is sufficient, it is possible to plant them out into their permanent positions in the summer, otherwise keep them in pots outdoors and plant them out in the spring. If you have sufficient quantity of seed, it can be sown thinly in an outdoor seed bed in the spring[78]. The seedlings can either be planted out into their permanent positions in the autumn/winter, or they can be allowed to grow on in the seed bed for a further season before planting them. Cuttings of mature wood, taken as soon as the leaves fall in autumn, outdoors in sandy soil.

nwatta Prefers a heavy soil and a damp situation[1, 11]. Grows well in heavy clay soils[11]. Tolerates drier soils than most members of this genus[200]. Succeeds in very infertile sites[200]. Trees probably tolerate temperatures down to between -5 and -10°c and so will not succeed outdoors in the colder areas of the country. A very ornamental tree[1]. This species has a symbiotic relationship with certain soil microorganisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. In garden design, as well as the aboveground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

# 8.1.37 Alnus jorullensis

Mexican alder, Evergreen Alder tfo2n 7 tlin 12 cyuc 0 kcak 3 tcan 0 dwat 25 m hkuc hmimhtut cyutli tcuphja7n hwicli hyishrasjlutnyik hpa7tli flatpriklwishsom hpa7tmwatli hjonli

drutta Alnus jorullensis is an evergreen Tree growing to 25 m (82ft) by 20 m (65ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Wind. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

tcanta Charcoal Fuel Hedge Soil conditioner Tannin WoodAgroforestry Uses: Alnus jorullensis is an early successional species that regenerates and colonizes on open disturbed ground where other forest types have been destroyed though natural processes, such as landslides, or as a result of anthropogenic activities. It is used extensively in reforestation on disturbed sites and is widely grown in plantations throughout MesoAmerica and South America as a timber and fuel wood species[338]. In agroforestry it is used in silvopastures to provide nitrogen for increasing forage availability and quality, to improve soil fertility, and it is grown in association with crops such as corn and beans, coffee and wild blackberries[338]. Other Uses: The wood and bark is rich in tannin, which is used to impart a red colour[331, 338 1. Woodland guides select this species for marking new trails through the mountain forests. The red marks of the bark cut by their machetes re as effective as red paint in marking the way[331]. The wood is rather light and soft but firm. straight-grained, rather fine-textured, easy to work, tough and strong, finishes smoothly, is not durable in contact with the ground[331]. It is used for the manufacture of boxes for transporting vegetables, shoe trees, matchsticks, post poles, broom handles, domestic implements, plywood cores and particle board. It is also locally harvested for firewood,

and charcoal production[338]. Used for ornamental planting in warm temperate areas such as southern California. Good for hedging and screening.

nrakta C. America - Honduras, Guatemala, Mexico ksate Moist soil habitats, such as stream and river banks, swamps and moist montane slopes, often in very dense stands, at moderate to high elevations[338].

propta Seed

nwatta Agroforestry Services: Crop shade Agroforestry Services: Nitrogen Management: Coppice Management: Standard Regional CropAlnus jorullensis is a plant of tropical montane forests, where temperatures are cool, with abundant rainfall. They are also found in high-elevation, open, oak-pine and fir woodlands in Mexico[338]. Grows best in a sunny position, but is somewhat shade tolerant[310 ]. Prefers a heavy soil and a damp situation, but it succeeds in ordinary garden soil[11]. Grows well in heavy clay soils[11] 1. Tolerates very infertile sites[200]. The tree responds well to coppicing[303]. This species has a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200 ]. Semideciduous in cool climates. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

### 8.1.38 Sophora tetraptera

Kowhai

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 0 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Sophora tetraptera is an evergreen Tree growing to 10 m (32ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The plant contains cytosine, which resembles nicotine and is similarly toxic[238].

tcanta WoodWood - compact, dense, heavy, of great strength, tough, elastic, extremely durable. Used for bearings, turnery, cabinet work, ornamental uses etc[46, 61, 139].

nrakta New Zealand and S. America - Chile. ksacta Streamsides, forest margins and lowland on North Island in New Zealand, from East Cape to latitude 40° 30's[44].

propta Seed - best sown as soon as it is ripe in a greenhouse[200]. Pre-soak stored seed for 12 hours in hot (not boiling) water and sow in late winter in a greenhouse[78]. Prick out the seedlings as soon as they are large enough to handle into individual pots in the greenhouse, and grow them on for 2 years under protected conditions. Plant them out into their permanent positions in early summer of their third year. Cuttings of young shoots with a heel, July/August in a frame[11]. Air-layering[200].

nwatta Succeeds in a well-drained moderately fertile soil in full sun[200]. Requires a warm sheltered position[202]. It grows best in the warmer areas of the country where the wood will be more readily ripened and better able to withstand winter cold[219]. Hardy to about -10°c[200], it succeeds in the open in southern and south-western Britain but is best grown against a wall elsewhere[11, 184]. Plants are of slow to moderate growth[202]. In good summers plants set abundant seed in this country[219]. Plants should be container-grown and planted out whilst young, older plants do not transplant well[219]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

## 8.1.39 Sophora secundiflora

Mescal Bean, Texas Mountain Laurel tfo2n 7 tlin 10 cyuc 0 kcak 3 tcan 1 dwat 10 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sophora secundiflora is an evergreen Tree growing to 10 m (32ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It brefers dry or moist soil.

pcista The plant, and especially the seeds, contains the poisonous alkaloid cytosine (or sophorin according to another report[82]), which resembles nicotine in its action and is similarly toxic[238].

tcanta Dye WoodLandscape Uses: Border, Espalier, Pest tolerant, Massing, Standard, Specimen, Street tree. A yellow dye is obtained from the wood[227]. Wood - very heavy, hard, close grained[82]. Of no commercial importance[227].

dwatta Hallucinogenic NarcoticHallucinogenic, narcotic[82, 161, 192]. An infusion of the seeds is used[192, 200], half a seed is enough to produce intoxication[192]. An infusion of the ground up seed has also been applied to ears in the treatment of earaches[213, 257]. The seeds contain the highly poisonous alkaloid cytosine (or sophorine) - this substance is related to nicotine and acts violently in the human system[213].

nrakta Southern N. America - Texas, New Mexico and Northern Mexico. ksacta Borders of streams, forming thickets or small groves in low rather moist limestone soils[82].

propta Šeed - best sown as soon as it is ripe in a greenhouse[200]. Pre-soak stored seed for 12 hours in hot (not boiling) water and sow in late winter in a greenhouse[78]. Prick out the seedlings as soon as they are large enough to handle into individual pots in the greenhouse, and grow them on for 2 years under protected conditions. Plant them out into their permanent positions in early summer of their third year. Cuttings of young shoots with a heel, July/August in a frame[11]. Air-layering[200].

nwatta Succeeds in a well-drained moderately fertile soil in full sun[200]. Succeeds in a hot dry position. Rather slowgrowing and difficult to transplant[227]. A very ornamental plant[274]. This species has not been tried outdoors in Britain, it is possibly hardy if grown in the sunniest mildest areas of the country, or against a sunny wall in less mild areas[11]. It grows best in the warmer areas of the country where the wood will be more readily ripened and better able to withstand winter cold[219]. Plants should be containergrown and planted out whilst young, older plants do not transplant well[219]. The flowers have a powerful and delicious fragrance[82, 200], though some people find them offensive[227]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200]. Special Features: North American native, Fragrant flowers, Attractive flowers

# 8.1.40 Millettia reticulata

Ji Xue Teng

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat 5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Millettia reticulata is a deciduous Climber growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August, and the seeds ripen from August to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers

dwatta Antispasmodic Aromatherapy Febrifuge Sedative StomachicAn undervalued medicinal herb, lemon verbena contains a strong lemon-scented essential oil that has calming and digestive qualities[254]. The plant has a gentle sedative action and a reputation for soothing abdominal discomfort. It has a mildly tonic effect upon the nervous system and helps to lift the spirits and counter depression[254]. The leaves and the flowering tops are antispasmodic, febrifuge, sedative and stomachic[4, 7, 238, 240]. A tea made from the leaves has a deliciously refreshing lemon flavour and is used mainly in treating digestive disorders[4] such as flatulence, indigestion and acidity[244]. Some caution is advisable though, since prolonged use or large internal doses can cause gastric irritation[268]. The herb is also useful as a stimulant for treating lethargy or depression[244] whilst it is also used to treat feverish colds[238]. The essential oil is used in aromatherapy in the treatment of nervous and digestive problems and also for acne, boils and cysts[238].

nrakta S. America - Argentina, Chile, Peru, Uruguay. Locally naturalized in the Mediterranean[50]. ksacta Fields and roadsides[238]. Open scrub[260].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in late spring. Only just cover the seed and keep in a light position, making sure the compost does not dry out. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in early summer and give some protection from the cold for at least their first winter outdoors. Cuttings of softwood, May/June in a frame. Grow on for at least their first winter in a greenhouse and plant out in late spring after the last expected frosts[K]. The cuttings root quickly and easily, though there can be losses in the first winter[K]. Cuttings of half-ripe wood. August in a frame. Grow on for at least their first winter in a greenhouse and plant out in late spring after the last expected frosts[K]. The cuttings root quickly and easily, though there can be losses in the first winter[K].

nwatta Succeeds in most moderately fertile soils if they are well-drained[200]. Prefers a light soil[219]. Requires a sunny sheltered position[166, 200]. Requires a warm damp climate[7]. A very ornamental plant[1], lemon verbena is only hardy in the milder areas of Britain[1, 11, 14], growing well in Cornwall[59]. It can withstand about 10°c of frost[184] and survives outdoors on a wall at Kew[K]. It generally survives most winters outdoors if growing in a suitable position, though it is often cut back to ground level and then resprouts from the base in late spring[120] or early summer[238]. Giving the roots a good, thick organic mulch will confer extra protection from winter cold[244]. The plant succeeds outdoors at Howick, a garden on the coast of Northumberland. The leaves are very aromatic with a lemon scent[182], they are often used to make a drink or for their essential oils[4]. There has been considerable confusion over the naming of this species. We are following the treatment used in [11] and [200], which is also the current treatment in the 1999 edition of The Plant Finder. However, the book 'World Economic Plants' uses the name A. citrodora Palau (a different author to the one we cite) as the correct name. Any pruning is best carried out in the spring[219]. This species is notably resistant to honey fungus[200]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [2-1].

# 8.2.37 Aloysia citriodora

Lemon Verbena, Lemon beebrush 7 tlin 10 cyuc 4 kcak 3 tcan 3 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Aloysia citriodora is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf from May to November, in flower in August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable

pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista The essential oil from the plant might sensitise the skin to sunlight[238]. Large doses of the tea can cause gastric irritation [301].

kcakta Edible Parts: LeavesEdible Uses: Leaves - occasionally cooked as a spinach[177] but more commonly used as a flavouring in salads, fruit salads etc[14, 21, 104, 183]. A delicious lemon-like flavour, it is adored by most people who try it[K]. A delicious and refreshing tea is made from the leaves[14, 21, 103, 183]. The dried leaves will retain their lemon aroma for many years[4].

tcanta An essential oil obtained from the leaves is extensively used in perfumery[7, 61]. An average yield of 0.5% is obtained[7]. There is some evidence that the use of this oil can sensitise the skin to sunlight and so its use has been largely replaced by the tropical plant lemongrass, Cymbogon spp\_[238]. The dried leaves retain their fragrance well and so are used in pot-pourri[238]. The growing plant repels midges, flies and other insects[201]. The essential oil is an effective insecticide in 1 - 2% concentration[240]. Landscape: Flower borders and beds Wall-side Borders City and Courtyard Gardens Cottage and Informal Garden Mediterranean Climate Plants.

dwatta An undervalued medicinal herb, lemon verbena contains a strong lemon-scented essential oil that has calming and digestive qualities [254]. The plant has a gentle sedative action and a reputation for soothing abdominal discomfort. It has a mildly tonic effect upon the nervous system and helps to lift the spirits and counter depression[254]. The leaves and the flowering tops are antispasmodic, febrifuge, sedative and stomachic[4, 7, 238, 240]. A tea made from the leaves has a deliciously refreshing lemon flavour and is used mainly in treating digestive disorders[4] such as flatulence, indigestion and acidity[244]. Some caution is advisable though, since prolonged use or large internal doses can cause gastric irritation[268]. The herb is also useful as a stimulant for treating lethargy or depression[244] whilst it is also used to treat feverish colds[238]. The essential oil is used in aromatherapy in the treatment of nervous and digestive problems and also for acne, boils and cysts[238].

nrakta S. America - Argentina, Chile, Peru, Uruguay. Locally naturalized in the Mediterranean[50]. ksacta Fields and roadsides[238]. Open scrub[260].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in late spring. Only just cover the seed and keep in a light position, making sure the compost does not dry out. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in early summer and give some protection from the cold for at least their first winter outdoors. Cuttings of softwood. May/June in a frame. Grow on for at least their first winter in a greenhouse and plant out in late spring after the last expected frosts[K]. The cuttings root guickly and easily. though there can be losses in the first winter[K]. Cuttings of half-ripe wood, August in a frame. Grow on for at least their first winter in a greenhouse and plant out in late spring after the last expected frosts[K]. The cuttings root quickly and easily, though there can be losses in the first winter[K].

nwatta Succeeds in most moderately fertile soils if they are well-drained[200]. Prefers a light soil[219]. Requires a sunny sheltered position[166, 200]. Requires a warm damp climate[7]. A very ornamental plant[1], lemon verbena is only hardy in the milder areas of Britain[1, 11, 14], growing well in Cornwall[59]. It can withstand about 10°c of frost[184] and survives outdoors on a wall at Kew[K]. It generally survives most winters outdoors if growing in a suitable position, though it is often cut back to ground level and then resprouts from the base in late spring[120] or early summer[238]. Giving the roots a good, thick organic mulch will confer extra protection from winter cold[244]. The plant succeeds outdoors at Howick, a garden on the coast of Northumberland. The leaves are very aromatic with a lemon scent[182], they are often used to make a drink or for their essential oils[4]. There has been considerable confusion over the naming of this species. We are following the treatment used in [11] and [200], which is also the current treatment in the 1999 edition of The Plant Finder. However, the book 'World Economic Plants' uses the name A. citrodora Palau (a different author to the one we cite) as the correct

of biomass with yields of up to 19 tonnes per hectare[269]. Sorghum bicolor has been used as Biomass, Brooms, and for Weaving. The flowering panicles are used as brushes brooms and whisks etc[1, 2, 4, 46, 57]. Stems are used for weaving fences, mats, wattle houses etc[178]. The plant is an excellent source of biomass[269].

dwatta Possible. For example Sorghum bicolor is Astringent, Demulcent, Diuretic, and Haemostatic. Sorghum halepense is Demulcent and Diuretic.

nrakta Origin: Hypothetical hybrid. Sorghum species range extend to Australia, Africa, Asia, Mesoamerica, and certain islands in the Indian and Pacific Oceans. ksacta Not known in the wild. Under development

propta Seed - sow April in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. Prick out the seedlings into individual pots once they are large enough to handle and plant them out after the last expected frosts. Division in mid spring as the plant comes into new growth. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Management: Hay Management: Standard Staple Crop: Balanced carb Staple Crop: Sugar Under DevelopmentClimate: cold temperate to tropical, tropical highlands. Humidity: semi-arid to humid. Sorghum is well suited for dry conditions, areas with uneven rainfall distribution that may adversely affect the growing season of other crops, and high year to year variation in rainfall and water supplies. Carbon Farming Solutions - Cultivation: under development. Management: standard, hay (Describes the non-destructive management systems that are used in cultivation) [1-1]. Sorghum is already weakly perennial in the tropics. It "rattoons", or resprouts for several years. Perennial breeding at the Land Institution focused on crosses with Johnsongrass (Sorghum halepense), while other breeders focus on Ni gao liang (Sorghum propinguum). Perennial sorghum could be bread for grain and sweet syrup. Sorghum is particularly suited to dry regions and some promising hybrids have been trialed [1-1]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2].

#### 8.2.35 Dioscorea iaponica

Glutinous Yam, Japanese vam 7 tlin 12 cvuc 4 kcak 0 tcan 2 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Dioscorea japonica is a PERENNIAL CLIMBER growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Edible species of Dioscorea have opposite leaves whilst poisonous species have alternate leaves[174].

kcakta Edible Parts: Leaves RootEdible Uses: Tuber cooked[174, 177, 179]. A very pleasant mild flavour with a floury texture, the roots can be eaten as a potato substitute[2]. The starch can be used as a binding agent for other foods[183]. Roots contain about 1.9% protein, 20% carbohydrate, 0.1% fat and 1% ash[179]. Leaf tips - cooked[183]. Tubercles - cooked[183].

dwatta Contraceptive Miscellany TonicThe tubers are prescribed in the treatment of diarrhoea, enteritis, enuresis and spermatorrhoea[218]. They are also dried and cut into shavings then used as a tonic[218]. The roots of most, if not all, members of this genus, contains diosgenin[222, 240]. This is widely used in modern medicine in order to manufacture progesterone and other steroid drugs. These are used as contraceptives and in the treatment of various disorders

1312

of the genitary organs as well as in a host of other diseases such as asthma and arthritis[222].

nrakta E. Asia - China, C. and S. Japan. ksacta Wooded foothills[58]. Mixed forests and margins, scrub forests, herb communities, mountain slopes, valleys, along rivers and streams, roadsides; 100 - 1200 metres[266].

propta Seed - sow March to April in a sunny position in a warm greenhouse and only just cover. It germinates in 1 -3 weeks at 20°c[175]. Prick out the seedlings as soon as they are large enough to handle and grow on in a greenhouse for their first year. Plant out in late spring as the plant comes into new growth. Basal stem cuttings in the summer[37]. Division in the dormant season, never when in growth[1]. The plant will often produce a number of shoots, the top 5 - 10 cm of the root below each shoot can be potted up to form a new plant whilst the lower part of the root can be eaten[K]. Tubercles (baby tubers) are formed in the leaf axils. These are harvested in late summer and early autumn when about the size of a pea and coming away easily from the plant. They should be potted up immediately in individual pots in a greenhouse or cold frame. Plant out in early summer when in active growth[K]

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it could succeed outdoors at least in the mildest areas of this country. The following notes are based on the general needs of the genus. Easily grown in a fertile well-drained soil in a sunny position or light shade[200]. Prefers a rich light soil[1]. Plants produce tubercles (small tubers that are formed in the leaf axils of the stems), and can be propagated by this means[K]. A climbing plant that supports itself by twining around the branches of other plants[219]. Dioecious. Male and female plants must be grown if seed is required. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern. is also useful and given here if available. Growth habit is a single or multiple shooting vine from a crown [1-2]. Herbaceous. The root pattern is tuberous with swollen potato-like

# 8.2.36 Aloysia triphylla

Lemon Verbena, Lemon beebrush 7 tlin 10 cyuc 4 kcak 3 tcan 3 dwat 3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Alovsia triphylla is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf from May to November, in flower in August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista The essential oil from the plant might sensitise the skin to sunlight[238]. Large doses of the tea can cause gastric irritation [301].

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves - occasionally cooked as a spinach[177] but more commonly used as a flavouring in salads, fruit salads etc[14. 21, 104, 183]. A delicious lemon-like flavour, it is adored by most people who try it[K]. A delicious and refreshing tea is made from the leaves [14, 21, 103, 183]. The dried leaves will retain their lemon aroma for many years[4].

tcanta Essential Insecticide Pot-pourri RepellentAn essential oil obtained from the leaves is extensively used in perfumery [7, 61]. An average yield of 0.5% is obtained [7]. There is some evidence that the use of this oil can sensitise the skin to sunlight and so its use has been largely replaced by the tropical plant lemongrass, Cymbopogon spp.[238]. The dried leaves retain their fragrance well and so are used in pot-pourri[238]. The growing plant repels midges, flies and other insects[201]. The essential oil is an effective insecticide in 1 - 2% concentration[240]. Landscape: Flower borders and beds Wall-side Borders City and Courtyard Gardens Cottage and Informal Garden Mediterranean Climate Plants.

tcanta Insecticide MiscellanyThe plant contains 8.1.42 Coriaria microphylla rotenone, which is used as an insecticide[218].

dwatta Emmenagogue Miscellany Oxytoxic Stomachic TonicJi Xue Teng is classified in Chinese herbalism as a plant that invigorates the blood. It is used mainly to treat menstrual problems, relieving pain and normalizing an irregular or absent cycle[254]. The roots and the vines are emmenagogue and stomachic[147]. A decoction is used in the treatment of stomach aches, breathlessness, anaemia in women, menstrual irregularities, vaginal discharge (bloody discharge and leucorrhoea), numbness and paralysis, backache and pain in the knees, seminal emission, gonorrhoea and stomach ache[147, 176]. The plant is used as a tonic to induce the growth of red blood cells[147, 218]. The plant contains the antitumour compound rotenone[218].

nrakta E. Asia - S. China. ksacta Damp shady places[147]. Thickets on slopes and in valleys at elevations of 100 - 950 metres[266].

propta Pre-soak the seed for 12 hours in warm water and sow in a greenhouse in spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in spring. Cuttings of half-ripe wood with the leaves removed, July/August in moist sand in a frame[200].

nwatta Succeeds in full sun in a fertile moistureretentive but well-drained soil[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c and down to about -15°c when given the protection of a warm sunny wall[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

# 8.1.41 Caesalpinia gilliesii

Bird Of Paradise, Bird-of-paradise shrub tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Caesalpinia gilliesii is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

pcista The green seed pods are severely irritating to the digestive tract[274].

dwatta AntitumorThe seeds are reported to have antitumour activity[274].

nrakta Southern South America - Argentina and Uruguay. ksacta Escaped from cultivation where it grows wild in pastures and dry habitats in Texas[274].

propta Seed - pre-soak for 12 - 24 hours in warm water and sow in a greenhouse in early spring[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings in sand in a frame[200].

nwatta Requires a sunny position[11], succeeding in any moderately fertile well-drained soil[200] including limy soils[182]. This species is on the borderline of hardiness in Britain. It can tolerate occasional lows down to about -12°c, so long as it is not too wet. It is best grown against a warm, sheltered sunny wall[200]. The plant succeeds against a warm wall at Kew Gardens, where it has grown to a height of 8 metres, it also succeeds in more open conditions on the Isle of Wight[11]. The plant is often cultivated for its very ornamental, showy flowers[274]. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

tfo2n 7 tlin 10 cvuc 0 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Coriaria microphylla is a deciduous Shrub growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen, Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The seed is poisonous[1]. The plant is toxic to grazing mammals[192]. Most, if not all members of this genus are poisonous, though it is said that the fruit is safe to eat[K].

tcanta Dye Ink TanninA black ink is obtained from the leaves, it can also be used as a dye[61, 128]. The bark can also be used, it is rich in tannin. An effective ground cover plant, spreading by rhizomes to form a fern-like colony[200].

dwatta HallucinogenicThe fruits are hallucinogenic[192]. When taken internally they provide sensations of flying[192].

nrakta Southern S. America. New Zealand. ksacta Steep cliffs or terraces in the Andes[192]

propta Seed - sow February/March in a greenhouse[78] The seed usually germinates in 1 - 3 months at 15°c[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7cm with a heel, July/August in a frame. Fair percentage[78]. Division in spring[200].

nwatta Prefers a fairly good loamy soil in a sunny sheltered position[164, 200]. Succeeds in light shade[200]. A very ornamental plant[1], it is only hardy in the milder areas of the country, such as S.W. England[1], where it tolerates temperatures down to about -5°c[200]. The roots of plants in this genus bear nitrogen-fixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

#### 8.1.43 Ceanothus thyrsiflorus

Blue Brush, Blueblossom

1289

tfo2n 7 tlin 9 cyuc 0 kcak 0 tcan 0 dwat 4.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ceanothus thyrsiflorus is an evergreen Shrub growing to 4.5 m (14ft) by 4.5 m (14ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from May to June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen, Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

tcanta Dye Hedge Hedge SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K]. The sub-species C. thyrsiflorus repens is a good ground cover plant for sunny positions, growing well on banks and reaching a height of 90cm[197, 2001. Plants can be grown as a hedge in exposed maritime areas though they do not succeed in the most exposed positions and can be slow to establish[75]. Wood - close-grained. rather soft[82].

nrakta South-western N. America - California to Oregon ksacta Wooded slopes and canyons below 600 metres, often

in the neighbourhood of streams, in evergreen forests in California [71, 82].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place within 1 -2 months at 20°c[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°c for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°c it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Landscape Uses: Erosion control, Ground cover. Hedge, Massing. Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[1]. Tolerant of maritime exposure[75]. A very ornamental plant[1] it is hardy to about -10°c[184, 200]. The sub-species C. thyrsiflorus repens. McMinn. is somewhat hardier, to about -15°c[184]. There are several named forms selected for their ornamental value[200]. A plant has reached 6 metres tall at Kew in an exposed position, but is damaged in severe winters[11]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. A fast-growing plant, it flowers well when young[11]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Plants flower on the previous year's growth, if any pruning is necessary it is best carried out immediately after flowering has finished[200, 219]. Constant pruning to keep a plant small can shorten its life[200]. There are a number of named varieties developed for their ornamental value[182]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212]. Special Features: North American native, Attractive flowers or blooms.

### 8.1.44 Ceanothus maritimus

Maritime Ceanothus

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus maritimus is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

tcanta Dye SoapA green dye is obtained from the flowers[168]. A god ground cover plant for maritime conditions[260]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin(K]. The developing seed cases are also a very good source of saponins[K].

nrakta South-western N. America - California. ksacta Coastal bluffs[260].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place within 1 -2 months at 20°c[138]. Another report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°c for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. It then requires a period of chilling below 5°c for up to 84 days before it will germinate[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°c it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node [200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good per-

mwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Requires a well-drained soil. This species is hardy to about -5°c and so succeeds outdoors in the milder areas of Britain[260]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Any runing is best carried out in the spring[219]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200, 212].

# 8.1.45 Erythrina x bidwillii

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Erythrina x bidwillii is a deciduous Shrub growing to 4 m (13ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The plant contains alkaloids that have powerful narcotic and purgative effects[200].

dwatta Narcotic PurgativeThe plant is narcotic and purgative[200].

nrakta A garden hybrid, E. crista-galli x E. herbacea. ksacta Not known in the wild.

propta Seed - pre-soak for 12 hours in warm water and sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Overwinter in a greenhouse and plant out in late spring or early summer. Heeled cuttings of young growth in the spring in a frame[200]. Overwinter in a greenhouse and plant out in late spring or early summer.

nwatta Requires a moderately fertile well-drained soil in a very sunny position[200]. Best if given the protection of an east, south or south-west facing wall[200]. Plants are not very hardy outdoors in Britain though the rootstock can tolerate temperatures down to about  $-10^{\circ}\mathrm{c}$  provided the stem bases are thickly mulched with organic matter such as leaf

Tea contains polyphenols, these are antioxidants that help to protect the body against heart diseases, stroke and cancer[238]. It also contains the stimulant caffeine which, when taken in excess, can cause sleeplessness and irritability and also, through its action as a diuretic, act to remove nutrients from the body. Tea is also rich in tannin and is a possible cause of oesophageal cancer[238]. Cold tea is sometimes used as a soaking liquid to flavour dried fruit[238]. One report says that the leaves are used as a boiled vegetable[179]. The leaves contain about 25.7% protein, 6.5% fat, 40.8% carbohydrate, 5% ash, 3.3% caffeine, 12.9% tannin[179]. Terminal sprouts with 2-3 leaves are usually handplucked, 10 kg of green shoots (75-80% water) produce about 2.5 kg dried tea[269]. The bushes are plucked every 7-15 days, depending on the development of the tender shoots. Leaves that are slow in development always make a better flavoured product[269]. Various techniques are used to produce black teas, usually during July and August when solar heat is most intense. Freshly picked leaves are spread very thinly and evenly on trays and placed in the sun until the leaves become very flaccid, requiring 13 hours or more, depending on heat and humidity. Other types of black teas are made by withering the leaves, rolling them into a ball and allowing to ferment in a damp place for 3-6 hours, at which time the ball turns a yellowish copper colour, with an agreeable fruity one[269]. If this stage goes too far, the leaves become sour and unfit for tea. After fermenting, the ball is broken up and the leaves spread out on trays and dried in oven until leaves are brittle and have slight odour of tea[269]. Tea is then stored in air-tight tin boxes or cans. As soon as harvested, leaves are steamed or heated to dry the natural sap and prevent oxidation to produce green tea. Still soft and pliable after the initial treatment, the leaves are then rolled and subjected to further firing. Thus dried, the leaves are sorted into various grades of green tea[269]. The flowers are made into 'tempura' using the edible oil that is obtained from the seed[183]. A clear golden-yellow edible oil resembling sasanqua oil is obtained from the seed[183, 269]. The oil needs to be refined before it is eaten. An essential oil distilled from the fermented dried leaves is used as a commercial food flavouring[238]. Tea extract is used as a flavour in alcoholic beverages, frozen dairy desserts, candy, baked goods, gelatines, and puddings[269]. Tea is a potential source of food colours (black, green, orange, yellow, etc.)[269].

tcanta Dve Essential Oil Oil Tannin WoodAn essential oil is distilled from the fermented and dried leaves[238]. It is used in perfumery and in commercial food flavouring[238]. A non-drying oil is obtained from the seeds. Refined teaseed oil, made by removing the free fatty acids with caustic soda, then bleaching the oil with Fuller's earth and a sprinkling of bone black, makes an oil suitable for use in manufacture of sanctuary or signal oil for burning purposes, and in all respects is considered a favourable substitute for rapeseed olive, or lard oils. The oil is different from cottonseed, corn, or sesame oils in that it is a non-drying oil and is not subject to oxidation changes, thus making it very suitable for use in the textile industry; it remains liquid below -18deq.C[269]. A grey dye is obtained from the pink or red petals[168]. The leaves contain 13 - 18% tannin[223]. The leaves also contain quercetin, a dyestuff that, when found in other plants, is much used as a dye[223]. The quantity of quercetin is not given[K]. Wood - moderately hard, close and even grained. It is very good for walking sticks[158].

dwatta Antidiarrhoeal Antiemetic Astringent Cardiotonic Diuretic Dysentery StimulantThe tea plant is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. Modern research has shown that there are many health benefits to drinking tea, including its ability to protect the drinker from certain heart diseases. It has also been shown that drinking tea can protect the teeth from decay[254], because of the fluoride naturally occurring in the tea[K]. However, the tea also contains some tannin, which is suspected of being carcinogenic[269]. The leaves are cardiotonic, diuretic, expectorant, stimulant and astringent[4, 174, 192, 218, 240, 2691. They exert a decided influence over the nervous system, giving a feeling of comfort and exhilaration, but also producing an unnatural wakefulness when taken in large doses[4]. They are used internally in the treatment of diarrhoea, dysentery, hepatitis and gastro-enteritis[218, 238]. Tea is reportedly effective in clinical treatment of amoebic dysentery, bacterial dysentery, gastro-enteritis, and hepatitis. It has also been reported to have antiatherosclerotic effects and vitamin P activity[269]. Excessive use, however, can lead to dizziness, constipation, constipation, indigestion, palpitations and insomnia[238]. Externally, they are used as a poultice or wash to treat cuts, burns, bruises, insect bites, ophthalmia, swellings etc[218, 238, 257]. Only the very young leaves and leaf buds are used, these can be harvested throughout the growing season from plants over three years old and are dried for later use[238]. Teabags have been poulticed onto baggy or tired eyes, compressed onto headache, or used to bathe sunburn[269].

nrakta E. Asia - China? Exact origin is uncertain. ksacta Shaded areas[192] at an elevation of 2100 - 2700 metres in Vinnar[11]

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Seedlings take 4 - 12 years before they start to produce seed[269]. There are approximately 500 seeds per kilo[269]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Landscape Uses: Specimen. Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland or a woodland clearing[166, 200]. Forms grown in this country are slow-growing[219]. Tea is reported to tolerate an annual precipitation of 70 to 310cm, an average annual temperature range of 14 to 27°C and a pH in the range of 4.5 to 7.3[269]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It prefers a wet summer and a cool but not very frosty dry winter[200]. The fragrant flowers are very attractive to insects, particularly moths[219]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. A very ornamental plant[1], it is widely cultivated in tropical and warm temperate areas for its leaves which are used to make China tea[1]. There are many named varieties[183] and new hardier forms are being produced in China for growing in colder areas of the country[260]. The Chinese form, known as 'Hsüeh-ch'a', is said to grow in areas within the snow limit on the mountains of Lingchiangfu in Yunnan province[178]. The subspecies C. sinensis assamica. (Mast.) Kitam, is a larger plant. growing up to 17 metres tall. It is a more tropical form of the species, is intolerant of frost and does not succeed outdoors in Britain[11, 260]. Special Features: Not North American native. Blooms are very showy.

# 8.2.34 Sorghum hybrids

Perennial Sorghum

7 tlin 12 cyuc 4 kcak 3 tcan 1 dwat 3 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Sorghum hybrids is a PERENNIAL growing to 3 m (9ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The pollen can induce hay fever[269].

kcakta Edible Parts: Seed StemEdible Uses: Carbon Farming Solutions - Staple Crop: balanced carb, sugar (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta Possible but not reported. Sorghum halepense is a good biomass plant. The plant is a potential source

basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - raw or cooked. A delicious flavour[266]. Of excellent quality, they are only slightly acrid raw[195], boiling them for a short time makes them suitable for salads[183]. The shoots, which are 2 - 4cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Plant support WoodThe canes have thick walls and, whilst not of the highest quality, can be used for many purposes including plant supports, all-round farm use, umbrella shafts, desk and chair legs[195]. The hard culms are usually used as handles of farm implements[266].

nrakta E. Asia - China, ksacta Mountains of Jiangsu, Zheijang. Anhui and Hunan.

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly guickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Industrial Crop: Biomass Management: Managed Multistem Minor Global Crop Other Systems: MultistrataRequires a rich damp soil in a sheltered position and plenty of moisture in the growing season[200]. Dislikes prolonged exposure to hard frosts[200], but plants have tolerated temperatures down to -22°c and are among the hardiest members of this genus[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. For polyculture design as well as the above-ground architecture (form - tree. shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2].

#### 8.2.32 Quercus aucheri

Boz-Pirnal Oak

7 tlin 10 cyuc 4 kcak 1 tcan 2 dwat 5 m hkuc hmimhtut cyutli kyuctcup hwicli jlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus aucheri is an evergreen Shrub growing to 5 m (16ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked. A sweet flavour[200]. The seed is about 2cm long and 1.5cm wide[200]. It is low in tannin and needs little if any leaching. Any bitter tannins can be leached out by thoroughly washing the dried and ground up seed in water, though many minerals will also be lost. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in

a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The seed can be roasted and then eaten, its taste is something like a cross between sunflower seeds and popcorn[183]. The roasted seed is a coffee substitute.

tcanta Repellent TanninThe following uses are for the closely related Q. coccifera, they should also be applicable here[K]. A mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dvestuff[4]. The bark is rich in tannin[148]. A black dye can be obtained from the bark[89] and also from the seeds[148].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta S. Europe - Mediterranean around Greece, ks-

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Plants are lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, but trees usually grow well in Britain[200]. The seed takes two years to ripen but is seldom produced in this country[11]. This species is closely related to O. coccifera and considered to be no more than a synonym of that species by some authorities[11]. Hybridizes freely with other members of the genus[200]. Many species in this genus are notably resistant to honey fungus[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11].

#### 8.2.33 Camellia sinensis

Tea Plant, Assam tea, Tea Tree Camellia 7 tlin 9 cyuc 4 kcak 3 tcan 4 dwat 4 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli dyatxre7t hjonli

drutta Camellia sinensis is an evergreen Shrub growing to 4 m (13ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil

pcista Care in patients with heart disease and in those with increased thyroid gland activity. Do not exceed 300mg/day if Pregnant (5 cups). Children may develop anaemia if excessive amounts. Hapatitis possible if products have high doses of green tea extract. Long-term intake over 1.5g caffeine per day can lead to: restlessness, irritability, sleeplessness, palpitations, vertigo, headaches, loss of appetite, vomiting and diarrhoea [301].

kcakta Edible Parts: Leaves Oil OilEdible Uses: Colouring Condiment Oil Oil TeaThe leaves are infused in hot water and used as the drink that is commonly known as tea. It is widely drunk in many areas of the world. Green tea is made from the steamed and dried leaves, whilst black tea (the form most commonly drunk in the west) is made from leaves that have been fermented and then dried[183, 238].

litter or sawdust and covered with bracken[200]. The top growth will be killed by the frost but new growth from the rootstock will flower in late summer[200]. Plants take 3 - 4 years to flower from seed[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.46 Coriaria myrtifolia

tfo2n 7 tlin 10 cvuc 0 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Coriaria myrtifolia is a deciduous Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista This plant is very poisonous[1, 11], the poison having the same effect as alcoholic intoxication.[89].

tcanta Dve Ink Insecticide TanninA black dve and an ink is obtained from the leaves[11, 103]. The bark can also be used[89], both the bark and the leaves are rich in tannin[46, 61, 1231. A fly poison is made from the crushed fruits[103].

nrakta Europe - Mediterranean. ksacta Dry woods, hedges and rocky places[50, 89].

propta Seed - sow February/March in a greenhouse[78]. The seed usually germinates in 1 - 3 months at 15°c[164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7cm with a heel, July/August in a frame. Fair percentage[78].

nwatta Prefers a fairly good loamy soil in a sunny sheltered position[11, 200]. Succeeds in light shade[200]. Plants are hardy to about -5°c, succeeding outdoors in Britain from London and south-westwards[11, 200]. The stems are often cut back by winter cold but the plants usually resprout from the base. This new growth does not flower in its first year[182]. The roots of plants in this genus bear nitrogenfixing nodules[218]. Whilst much of the nitrogen will be utilized by the growing plant, some of it will become available for other plants growing nearby[K].

#### 8.1.47 Calicotome spinosa

tfo2n 7 tlin 10 cvuc 0 kcak 0 tcan 0 dwat 3 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Calicotome spinosa is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

tcanta Hedge HedgePlants can be used for low hedging[200].

nrakta Europe - W. Mediterranean, ksacta Dry stony habitats in evergreen scrub near the coast. It is especially common in areas after woodland clearance[200].

propta Seed - we have no information on this species but suggest pre-soaking the seed for 12 - 24 hours (by which time it should have swollen up) in warm water and sowing it in a greenhouse in early spring. Pot up the seedlings as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse, planting out in late spring or early summer in their permanent positions. Cuttings of half ripe wood. July/August in a frame. It is probably best to put each cutting in its own pot.

nwatta Succeeds in a very well-drained soil in a sunny position[200]. This species is not hardy in the colder areas

of Britain, it tolerates temperatures down to between -5 and -10°c if it is given perfect drainage[200]. Plants dislike root disturbance[200], they should be planted out into their permanent positions whilst young. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.48 Calicotome villosa

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 0 dwat 3 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.49 Erythrina crista

Coral Tree, Crybabytree

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli drutta Erythrina crista-galli is a deciduous Shrub growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It

and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. pcista The plant contains alkaloids that have powerful narcotic and purgative effects[200]. The seeds of all mem-

can fix Nitrogen. Suitable for: light (sandy), medium (loamy)

bers of this genus are said to be poisonous[274]. dwatta Narcotic PurgativeThe plant is narcotic and

purgative[200]. nrakta S. America - Brazil, Argentina, Uruguay. ksacta

Not known

propta Seed - pre-soak for 12 hours in warm water and sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Overwinter in a greenhouse and plant out in late spring or early summer. Heeled

cuttings of young growth in the spring in a frame[200]. Overwinter in a greenhouse and plant out in late spring or early summer.

nwatta Requires a moderately fertile well-drained soil in a very sunny position[200]. Best if given the protection of an east, south or south-west facing wall[200]. Plants are not very hardy outdoors in Britain though the rootstock can tolerate temperatures down to about -10°c provided the stem bases are thickly mulched with organic matter such as leaf litter or sawdust and covered with bracken[200]. The top growth will be killed by the frost but new growth from the rootstock will flower in late summer[200]. A plant growing outdoors at the RHS Gardens in Wisley, Surrey, grows and flowers well in a warm sheltered corner[260]. Its root is mulched each winter to protect it from the cold[260]. A form called 'Compacta' is said to flower more freely than the type[233]. Plants take 3 - 4 years to flower from seed[200]. Plants are difficult to establish, taking some years to flower[202]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.50 Caesalpinia decapetala

Mysore Thorn, Shoofly tfo2n 7 tlin 10 cyuc 0 kcak 2 tcan 2 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Caesalpinia decapetala is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It can fix Nitrogen. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

tcanta Hedge Hedge Tannin WoodThe bark is a rich source of tannin[158, 272]. Plants are often grown as field boundaries in Nepal[272]. An excellent hedge plant[240]. However, due to its doubtful hardiness it is not a good candidate for this use in Britain. Wood - moderately hard[146]. Environmental Uses include: Agroforestry; Boundary, barrier or support; Soil improvement. It is used as an Ornamental

dwatta Anthelmintic Antiperiodic Astringent Emmenagogue Febrifuge Laxative PurgativeAnthelmintic, antiperiodic, astringent, febrifuge[158, 178]. The leaves are emmenagogue and laxative[240, 243]. They are applied externally to burns[240, 243]. The root is purgative[240, 243].

nrakta E. Asia - Himalayas to China. ksacta Hedges and open bushy places [146]. Swampy localities and ravines to 1800 metres [158].

propta Seed - pre-soak for 12 - 24 hours in warm water and sow in a greenhouse in early spring[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings in sand in a frame[200].

nwatta Requires a sunny position[11], succeeding in any moderately fertile well-drained soil[200] including limy soils[182]. This species is on the borderline of hardiness in Britain. However, C. japonica, which is considered to be no more than a variety of this species by many botanists, succeeds on a wall at Wisley to the west of London and is said to be hardy to about -10°c[184]. Its natural range is Japan where it grows at heights up to 2000 metres on rocky mountain slopes in the cooler regions of the country[11. 2001. Plants in this genus are notably resistant to honey fungus[200]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby [200]. It has a special soil tolerance for shallow soils.

#### 8.1.51 Ceanothus purpureus

Hollyleaf Ceanothus

tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus purpureus is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

tcanta Dye SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K]. The spreading forms of this species make a useful ground cover, especially on warm sunny slopes[2001.

nrakta South-western N. America - California. ksacta Dry rocky hills below 550 metres[71].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place within 1 -2 months at 20°c[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°c for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°c it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Plants usually produce an abundance of seed in British gardens[11]. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. This species is difficult to root[200]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. This species is difficult to root[200].

nwatta Prefers a warm sunny position but tolerates light shade[11, 200]. Requires a well-drained soil[11]. Tolerates some lime, but will not succeed on shallow chalk[200]. Plants are not fully hardy at Kew Botanical Gardens, though they succeed outdoors to the south and west of London[11]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Plants flower on the previous year's growth, if any pruning is necessary it is best carried out immediately after flowering has finished[200]. Constant pruning to keep a plant small can shorten its life[200, 219]. Fast growing, it flowers well when young, often in its second year from seed[11]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200,

# 8.1.52 Ceanothus divergens

Cropleaf Ceanothus, Calistoga ceanothus tfo2n 7 tlin 10 cyuc 0 kcak 0 tcan 0 dwat 1.5 m hkuc valleys at elevations of 1100 - 1200 metres[266].

propta Seed - surface sow as soon as it is ripe in a green-house at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Landscape Uses: Container, Massing, Specimen. Requires a rich damp soil in a sheltered sunny position[200, 238] and plenty of moisture in the growing season[1]. A very hardy plant, tolerating temperatures down to at least -7°c, but it dislikes prolonged exposure to hard frosts[200]. Another report says that it is hardy to about -18°c[195]. A very ornamental plant[1]. There are many named forms of this species, some of them are given specific status by some botanists[11, 200]. These forms include 'Boryana', 'Fulva', 'Henonis' and 'Punctata'. It is the form 'Henonis' that is normally used medicinally in China[176]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. This species is notably resistant to honey fungus[200]. The plant has a running rootstock, though not aggressively so in the cooler climate of Britain[200]. and it produces new shoots from May[25]. Cultivated for its edible young shoots in China[61]. This species has been widely planted for ornament in the Mediterranean and is becoming established[50]. The ssp. P. nigra boryana and P. nigra henonis are also mentioned for their edible young shoots, they are both cultivated for their edible shoots which are similar in all respects to P. nigra. Dead stems can be removed at any time of the year[238]. It is also possible to thin the clumps in spring, leaving only the strongest stems and thus creating an open grove-like effect[238]. Special Features: Attractive foliage.

#### 8.2.29 Schisandra grandiflora

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 6 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Schisandra grandiflora is a deciduous Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from April to May, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105, 177]. A pleasantly acid flavour[2], they make a nice dessert fruit[K]. The fruit is about 6mm in diameter and is borne in a grape-like bunch about 12cm long[200].

nrakta E. Asia - China to the Himalayas. ksacta Mixed forests and shrubberies at elevations of 1700 - 3300 metres in the Himalayas[51, 272].

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in

early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Prefers light shade but tolerates full sun if the soil is reliably moist and the roots are in shade[202]. Plants are intolerant of drought[K]. The fully dormant plant is hardy to about -15°c[184], though the young growth in spring can be damaged by late frosts. Plants are of slow to moderate growth rate[202]. The shoots are semi-twining, but plants often require some support by tying the plant in[202]. Diocious. Male and female plants must be grown if seed is required. Another report says that the plants are monoecious (male and female flowers are separate but are found on the same plant)[182].

#### 8.2.30 Schisandra rubriflora

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 6 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Schisandra rubriflora is a deciduous Climber growing to 6 m (19ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from April to May, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 105, 177]. Delicious[K]. The fruit is about 6mm in diameter and is borne in a grape-like bunch about 12cm long[200].

nrakta E. Asia - China to the Himalayas. ksacta Forests and shrubberies to 3300 metres. in the Himalayas[51].

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[2001].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Prefers light shade but tolerates full sun if the soil is reliably moist and the roots are in shade[202]. Plants are intolerant of drought[K]. The fully dormant plant is hardy to about -15°c[184], though the young growth in spring can be damaged by late frosts. Plants are of slow to moderate growth rate[202]. The shoots are semi-twining, but plants often require some support buy tying the plant in[202]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.31 Phyllostachys nuda

7 tlin 10 cyuc 4 kcak 2 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys nuda is an evergreen Bamboo growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and

nrakta E. Asia - China - N.W. Yunnan. ksacta An understorey shrub in woodlands[200]. Scattered in broad-leaved forests at elevations around 1900 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially in if the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This plant has become very rare in its native range and is designated an endangered species[266]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200].

# 8.2.27 Phyllostachys dulcis

Sweetshoot Bamboo

7 tlin 10 cyuc 4 kcak 2 tcan 0 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phyllostachys dulcis is an evergreen Bamboo growing to 7 m (23ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: midble acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots -raw or cooked. Free of any acridity, they make excellent eating[183]. Used in salads, soups, stews etc, this is one of the most highly esteemed edible bamboos in China[183, 195]. The shoots, which are 4 - 6cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta WoodCanes can be used for industrial purposes but are weaker than many other members of this genus[195]. The culms are used as handles of farm tools[266].

nrakta E. Asia - China. ksacta Not known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position. Dislikes drought[195]. A fairly hardy species, but it dislikes prolonged exposure to hard frosts. One report says that it tolerates temperatures down to about -10°c[200], down to

-20°c in another report, though this report also says that this species does not like growing in areas with frequent low temperatures[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The new growth emerges in early spring. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. Cultivated in China for its edible young shoots[183, 266]. The plant is heat tolerant in zones 10 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the aboveground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. The plant growth habit is a runner spreading indefinitely by rhizomes or stolons [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length

#### 8.2.28 Phyllostachys nigra

Black Bamboo, Kuro-Chiku

7 tlin 10 cyuc 4 kcak 0 tcan 3 dwat 7.5 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phyllostachys nigra is an evergreen Bamboo growing to 7.5 m (24ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked[25, 46, 105, 177]. Somewhat acrid when raw[61], they are prepared for eating by boiling in one change of water, the water being changed after 8 - 10 minutes[183]. A distinctive taste and aroma[183]. The shoots, which are about 5cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Basketry Plant support WoodThe canes make good plant supports. Thin walled but durable, the canes are also used for cabinet work and for decorative panels and inlays[195]. The rhizome is used in making umbrella handles, wickerwork, canes, musical instruments and various kinds of handicrafts[25.74].

dwatta Antiemetic Antitussive Astringent Depurative Diuretic Expectorant Febrifuge Sedative StypticThe leaves are antipyretic and diuretic[218]. They are used internally in the treatment of fevers (especially infantile convulsions), vomiting and nosebleeds[238]. The leave are harvested during the growing season and dried for later use[238]. The juice of the stems is antipyretic, antitussive, expectorant and sedative[147, 176, 218]. It is taken internally in the treatment of lung infections with cough and phlegm[238]. The sap is pressed from young stems in the summer and then dried for later use[238]. The epidermis of the stem bark is antiemetic, depurative and sedative[147, 176, 218]. It is used internally in the treatment of vomiting, nosebleeds, coughs etc[238]. The epidermis is collected from young stems in the summer and is dried for later use[238]. The root is astringent, antipyretic, diuretic and styptic[147, 176, 218]. It has been used in the treatment of rabies [238]. The roots are harvested in the winter and dried for later use[238].

nrakta E. Asia - E. and C. China. ksacta Fertile and moist places, also by streams[147]. In open forests, on slopes or in

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ceanothus divergens is an evergreen Shrub growing to 1.5 m (5ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH. mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

tcanta Dye SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K]. A useful ground cover plant, especially on warm sunny slopes[208].

nrakta South-western N. America - California. ksacta A very rare plant in the wild where it grows in serpentine volcanic substrates in Chapparal plant communities at elevations of 900 - 1800 metres[276].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place in 1 - 2 months at 20°c[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°c for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°c it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel. October in a cold frame[78]. The roots are guite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Requires a well-drained soil and prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. A difficult plant to cultivate, it might do well in a lime-free soil in full sun and occasionally does well on heavier soils[208]. Plants are hardy to about -10°c[200]. This species is closely related to C. purpureus[11]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Plants flower on the previous year's growth, if any pruning is necessary it is best done immediately after the plant has finished flowering[200, 219]. Constant pruning to keep a plant small can shorten its life[200]. Fast growing, it flowers well when young[11]. There are some named forms selected for their ornamental value[200]. Hybridizes freely with other members of this genus[200]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200,

#### 8.1.53 Lupinus arboreus

Tree Lupin, Yellow bush lupine tf02n 7 tlin 10 cyuc 0 kcak 5 tcan 0 dwat 1.5 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lupinus arboreus is an evergreen Shrub growing to 1.5 m (5ft) by 1.2 m (4ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista The seed of many lupin species contain bittertasting toxic alkaloids, though there are often sweet varieties within that species that are completely wholesome[65, 76]. Taste is a very clear indicator. These toxic alkaloids can be leeched out of the seed by soaking it overnight and discarding the soak water. It may also be necessary to change the water once during cooking. Fungal toxins also readily invade the crushed seed and can cause chronic illness[65].

tcanta Dye Pioneer Soil reclamation StringA bright yellow dye is obtained from the flowers[168]. The root fibres have been used to make a string for making nets etc[257]. Plants are used in land reclamation schemes to stabilize sandy soils and dunes[200]. Because they are fast growing and tolerant of maritime exposure, they quickly provide shelter for other plants as well as enriching the soil with nitrogen[K]. An excellent pioneering plant in permaculture, even in exposed areas it grows rapidly to its maximum height of about 1.5 metres and will give shelter to enable other less tolerant plants to become established. It is especially useful for helping the establishment of shrubs and herbaceous perennials in small gardens[K].

nrakta South-western N. America - California to Oregon. Naturalized in S. England. ksacta Stable sand dunes, coastal scrub and pine forest close to the coast. Naturalized by the sea in S. England [184].

propta Pre-soak the seed for 24 hours in warm water and then sow in early spring in a greenhouse[1, 200]. Germination should take place within a couple of weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. It should also be possible to sow the seed in situ in mid to late spring. Protect the seed from mice. Cuttings of short side-shoots with a heel, July/August in a frame[11].

nwatta Requires a well-drained dry or moist soil in a sunny position[11, 182]. Prefers an alkaline soil[188]. Grows well near the coast[11], resisting maritime exposure. Established plants are drought tolerant[190]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Hardy to about -15°c[184, 200]. Plants are hardy in all but severe winters in Britain[200], though they become less hardy with age[11]. A fast-growing but shortlived plant[182], especially when growing in rich soils[11]. Plants have reached 2.7 metres tall and wide within 4 years from seed in a rich soil, flowering and producing seed prolifically[11]. Plants self-sow when in a suitable position[200]. The flowers bear the fragrance of white clover[245]. This species has a symbiotic relationship with certain soil bacteria, these bacteria form nodules on the roots and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby[200].

#### 8.1.54 Ceanothus impressus

Santa Barbara Ceanothus

tfo2n 7 tlin 9 cyuc 0 kcak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ceanothus impressus is an evergreen Shrub growing to 1.5 m (5ft) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs). It can fix Nitrogen. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist soil.

tcanta Dye SoapA green dye is obtained from the flowers[168]. All parts of the plant are rich in saponins - when

crushed and mixed with water they produce a good lather which is an effective and gentle soap[168, 169]. This soap is very good at removing dirt, though it does not remove oils very well. This means that when used on the skin it will not remove the natural body oils, but nor will it remove engine oil etc[K] The flowers are a very good source, when used as a body soap they leave behind a pleasant perfume on the skin[K]. The developing seed cases are also a very good source of saponins[K].

nrakta South-western N. America - coastal California. ksacta Grows in chapparal plant communities from sea level to elevations of 200 metres [276].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed should be pre-soaked for 12 hours in warm water and then given 1 - 3 months stratification at 1°c[138, 200]. Germination usually takes place in 1 - 2 months at 20°c[138]. One report says that the seed is best given boiling water treatment, or heated in 4 times its volume of sand at 90 - 120°c for 4 - 5 minutes and then soaked in warm water for 12 hours before sowing it[214]. The seed exhibits considerable longevity, when stored for 15 years in an air-tight dry container at 1 - 5°c it has shown little deterioration in viability[214]. The seed is ejected from its capsule with some force when fully ripe, timing the collection of seed can be difficult because unless collected just prior to dehiscence the seed is difficult to extract and rarely germinates satisfactorily[214]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, taken at a node[200], July/August in a frame[11]. Cuttings of mature wood of the current year's growth, 7 - 12 cm with a heel, October in a cold frame[78]. The roots are quite brittle and it is best to pot up the callused cuttings in spring, just before the roots break[78]. Good percentage.

nwatta Landscape Uses:Border, Container, Foundation, Pest tolerant, Hedge, Massing, Rock garden, Screen. Prefers a warm sunny position but tolerates light shade[11, 200]. Tolerates some lime, but will not succeed on shallow chalk[200]. Plants are hardy to about -10°c[200], they succeed in the open in the milder parts of the country but are best grown by a sunny wall in colder areas[11]. This is one of the hardiest and most satisfactory of the evergreen members of the genus in Britain[11]. It is a fast-growing species that can flower in 2 years from seed[200]. The cultivar 'Puget Blue' is very vigorous and flowers freely, though it is likely to be of hybrid origin. This species is closely related to C. dentatus[11]. Hybridizes freely with other members of this genus[200]. Plants dislike root disturbance, they should be planted out into their permanent positions whilst still small[182]. Dislikes heavy pruning, it is best not to cut out any wood thicker than a pencil[182]. Some members of this genus have a symbiotic relationship with certain soil micro-organisms, these form nodules on the roots of the plants and fix atmospheric nitrogen. Some of this nitrogen is utilized by the growing plant but some can also be used by other plants growing nearby [200, 212]. Special Features: North American native, Blooms are very showy.

#### **8.2** mran

#### 8.2.1 Araucaria araucana

Monkey Puzzle Tree 7 tlin 11 cyuc 5 kcak 3 tcan 1 dwat 30 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Araucaria araucana is an evergreen Tree growing to 30 m (98ft) by 15 m (49ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade

(light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked. Rich in starch[183]. The seed is soft like a cashew nut and has a slight flavour of pine nuts. This is a delicious seed and it makes very pleasant eating. It is a food that can easily be eaten in quantity and can be used as a staple food in the diet(K). Fairly large, the seeds are about the size of an almond and can be 3cm long x 1cm wide. They are harvested in the autumn and, when kept in cool, dry conditions will store for at least 9 months(K).

tcanta Resin Shelterbelt WoodVery tolerant of maritime exposure, trees can be grown as part of a shelterbelt, though they are very slow growing and have an open canopy and so do not give a lot of shelter[75, 81]. A resin is obtained from incisions in the trunk. This is used mainly for medicinal purposes[46, 61, 139]. Wood - pale yellowish, good quality, takes a beautiful polish. Used for joinery and carpentry[1, 46, 61, 139].

dwatta VulneraryA resin obtained from incisions in the trunk is used in the treatment of ulcers and wounds[46, 61, 120]

nrakta S. America - S. Chile ksacta Mountain slopes in deep sandy soils in coniferous woodland, usually with Nothofagus spp[139].

projta Seed - best sown as soon as it is ripe in a cold frame [134] or it can be stored cool and moist then sown February in a greenhouse[78, 80]. Although the plants are quite cold-tolerant, the root systems of seedling plants can be damaged in spells of very cold weather so give some extra protection at this time if necessary. The seed usually germinates in 1 - 2 months at 15°c[134]. As soon as they are large enough to handle, prick the seedlings out into individual pots. The plants have a rather sparse root system and are best placed in their final positions as soon as possible. Give them some protection for their first winter[K]. Cuttings of half-ripe wood, May to July in a cold frame. Only epicormic side-shoots should be used, normal side-shoots do tot develop properly[81]. An epicormic shoot is one that develops from a dormant bud on the main trunk of the tree[K].

nwatta Management: Standard Regional Crop Staple Crop: Balanced carbLandscape Uses:Pest tolerant, Aggressive surface roots possible, Specimen. Prefers a deep welldrained soil[11, 200]. Dislikes hot dry soils[1]. Dislikes atmospheric pollution[166]. Very tolerant of maritime exposure and salt laden winds[75, 81]. The monkey puzzle is a very slow growing tree that can take 5 - 10 years before it even gets above grass height and then grows around 35cm a year [185]. New growth takes place from late June to September[185]. The seed forms a staple food for the native Indians in regions where it grows in Chile, it is also sold in local markets there[46, 139]. This tree has an excellent potential to become a commercial crop in the western parts of Britain, it is high yielding, has large tasty seeds and is easily harvested. Its main disadvantages are its slow rate of growth and the time it takes before the first crop is produced - this can be up to 40 years from seed though we have often seen plants less than 20 years old produce cones[K]. The plant is dioecious so at least one male plant needs to be grown for every 5 -6 females - unfortunately there is no way of telling the sex of the tree until it flowers. There are means of vegetative reproduction and it might be possible to produce clones of known sex in the future - these will probably come into bearing at an earlier age. If you have the space to plant at least 5 trees, and the foresight, this is a tree that will be a very valuable food crop in the future[K]. It is said that 18 goodsized trees can provide enough for an adult's sustenance all year round[2]. Plants grow best in S.W. England and along the west coast of Britain where they produce seed regularly and abundantly[11, 80]. Female cones take 2 - 3 years to mature and break up at the end of the year [185]. They contain up to 200 large seeds. Plants self-sow in Cornwall[80]. We have records of trees regularly producing good crops of seeds in various sites in Cornwall, Devon and the west coast of Scotland. We also have one report of an excellent crop in 1997 from trees at Alvaston Castle near Derby and of a tree in Bedfordshire producing a heavy crop[K]. Trees are notably susceptible to honey fungus[81, 200]. Unlike most conifers, this tree can be coppiced[81]. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 12 through 6. (Plant Hardiness Zones show how well plants withstand cold

and had more than 15 mature cones[K]. A very old specimen at Kew was carrying lots of 1st and 2nd year cones in July 1996[K]. The cones ripen in their third year and can then remain unopened on the tree for several years[1, 81, 200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. This species does not hybridize with other members of this genus[117]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow under the trees[18]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Not North American native, Inconspicuous flowers or blooms.

#### 8.2.25 Arbutus unedo

Strawberry Tree

7 tlin 11 cyuc 4 kcak 2 tcan 2 dwat 9 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Arbutus unedo is an evergreen Tree growing to 9 m (29ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from October to December, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Sweet but insipid[2, 3, 5]. The Latin name 'unedo' means 'I eat one (only)' and suggests that the fruit is not very palatable[K], though another report says that the fruit is so delicious that a person only needs to eat one[245]. It does have a somewhat gritty skin, but the fruit itself has the texture of a lush tropical fruit and has a delicate pleasant flavour. For those people with sensitive taste buds, this is a fruit that can be enjoyed when eaten in moderate quantities[K]. The fruit contains about 20% sugars and can be used to make delicious and nourishing jams and preserves[7]. It is ripe in November/December and is about 15mm in diameter. When fully ripe it falls from the tree and so it is advisable to grow the plant in short grass in order to cushion the fall of the fruitfKl.

tcanta Tannin WoodTannin is obtained from the leaves, bark and fruit[46, 61]. The bark contains 45% tannin[46]. Wood - used for turning, Greek flutes etc[89, 148]. It makes a good charcoal[4, 89, 148].

dwatta Antiseptic Astringent Diuretic Dysentery UrinaryThe strawberry tree is little used in herbalism, though it does deserve modern investigation[268]. All parts of the plant contain ethyl gallate, a substance that possesses strong antibiotic activity against the Mycobacterium bacteria[268]. The leaves, bark and root are astringent and diuretic[7, 46, 268]. They are also a renal antiseptic[7] and so are of use in the treatment of affections of the urinary system such as cystitis and urethritis[254]. Their astringent action makes them of use in the treatment of diarrhoea and dysentery and, like many other astringent plants, a gargle can be made for treating sore and irritated throats[254]. The leaves are gathered in the summer and dried for later use[7]. The flowers are weakly diaphoretic[268].

nrakta S. Europe and S.W. Ireland. ksacta Woodland, scrub and rocky hillsides, often on limestone and sand-stone[17, 45].

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse[78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at 20°c[134]. Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. Basal cuttings in late winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of

young wood - can take 2 years[1, 200].

nwatta Landscape Uses:Container, Espalier, Pest tolerant, Hedge, Standard, Specimen. Requires a nutrient-rich well-drained moisture-retentive soil in sun or semi-shade and shelter from cold drying winds, especially when young[11, 2001. Grows well in heavy clay soils and in dry soils. Most species in this genus require a lime-free soil but this species is fairly lime tolerant[11, 200]. Succeeds in fairly exposed maritime positions[166, 200]. A tree in a very exposed position at Rosewarne in N. Cornwall was looking rather tattered in April 1987 but it was 4.5 metres tall and carrying a very good crop of immature fruit[K]. Tolerates industrial pollution[200]. Plants have withstood temperatures down to -16°c without injury at Kew[11]. They grow very well in S.W. England, fruiting well in Cornwall[49, 59]. Plants resent root disturbance and are best placed in their final positions whilst young[11, 134]. Give them some protection in their first winter. The strawberry tree flowers in November and December, the fruit takes 12 months to ripen and so the tree carries both mature fruit and flowers at the same time and is incredibly beautiful at this time[K]. The flowers have a soft honey scent[245]. There are a number of named varieties[183] developed for their ornamental value. 'Elfin King', 'Croomei' and 'Rubra' are all small forms that fruit well when small[182]. The variety 'Rubra' was 1.2 metres tall at Kew in late 1990 and was laden down with fruits and flowers[K]. 'Elfin King' only reaches a height of 1 metre, comes into bearing when young and fruits well[183]. It is ideal for container culture[183], 'Croomei' is said to be a more reliable fruiting form[49]. Special Features: Attracts birds, Not North American native, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 6. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. In garden design, as well as the aboveground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching; a heart root, dividing from the crown into several primary roots going down and out [2-1].

#### 8.2.26 Cephalotaxus lanceolata

Yunnan Plum Yew

7 tlin 10 cyuc 4 kcak 2 tcan 0 dwat 8 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus lanceolata is an evergreen Shrub growing to 8 m (26ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: We have no details for this species but it is closely related to C. fortunei and so it is quite likely to have edible seed and fruit[K]. The fruit is up to 4.5cm long and 2cm wide[200]. It is certainly worthy of more research[K]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K].

tcanta Hedge HedgeVery tolerant of pruning, this plant makes a very good hedge in shady positions[200].

drutta Cephalotaxus wilsoniana is an evergreen Tree growing to 10 m (32ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[81]. Fairly large, about 30mm x 15mm[200]. We have no more details, though this plant is closely related to C. harringtonia, the fruit of which is edible raw if fully ripe[K]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K]. It is quite likely that the seed of this species is also edible. More research is required[K].

nrakta E. Asia - Taiwan ksacta An understorey tree in woodlands[200].

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially in if the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Closely related to C. fortunei[11, 200]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branch-

#### 8.2.24 Pinus pinea

Italian Stone Pine, Umbrella Pine, Stone Pine
7 tlin 11 cyuc 4 kcak 4 tcan 2 dwat 10 m hkuc
htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli dyat hionli

drutta Pinus pinea is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen in April. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

pcista The wood, sawdust and resins from various species of pine can cause dermatitis in sensitive people[222]. kcakta Edible Parts: SeedEdible Uses: CondimentSeed - raw or cooked[1, 2, 4, 11, 34, 63]. Rich in oil, the seed has a soft texture with a hint of resin in the flavour. It makes a delicious snack and can also be used as a staple food[K].

The seeds are often added to ice cream, cakes, puddings etc[183]. They can also be ground into a powder and used as a thickener and flavouring in soups etc[K]. The seed is a good size, up to 20mm x 10mm, and is a major source of pine nuts in commerce[200]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200]. Young pine cones can be ground into a powder and used as a flavouring.[183]

tcanta Dve Herbicide Resin WoodA tan or green dve is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Yields a resin and turpentine[57, 64, 171]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile [64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood. Used for carpentry, furniture making etc[100].

dwatta The turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

nrakta S. Europe around the Mediterranean. ksacta Maritime sands and alluvium[89].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also hadly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Management: Standard Minor Global Crop Staple Crop: Protein-oilLandscape Uses:Aggressive surface roots possible. Screen, Seashore, Specimen, Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1] and shady positions[160]. Established plants tolerate drought[200]. Succeeds in a chalky soil[11]. This species is hardy to about -18°c[160]. Although sometimes thought to be somewhat tender in this country, it is perfectly hardy as far north as south-east Scotland[185]. The trees transplant very badly if they are allowed to stay in one position for more than 2 years. This is usually a short-lived tree, rarely surviving for much more than 100 years[185]. The Italian stone pine is extensively planted for its edible seeds in Europe[81, 200]. The variety 'Fragilis' has thin shelled seeds and is the form most widely cultivated[200]. Trees take between 10 and 20 years to produce cones from seed[160]. One of our plants produced its first young female cone when 7 years old, though this did not mature because it was not fertilised[K]. A 20 year old plant at Kew was about 4.5 metres tall with a number of trunks

winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen.

#### 8.2.2 Diospyros lotus

Date Plum

7 tlin 9 cyuc 5 kcak 2 tcan 1 dwat 9 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Diospyros lotus is a deciduous Tree growing to 9 m (29ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in July, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3]. The fruit has an exquisitely rich flavour when it is fully ripe (almost at the point of going bad), but it is very harsh and astringent before then[K]. The fruit may not ripen properly in a cool summer, though if it is frosted it normally develops a very good flavour[K]. The fruit can be dried, when it acquires a date-like flavour[61, 183]. The fruit can also be harvested in the autumn, preferably after a frost, and bletted[183]. (This is a process where the fruit is kept in a cool place and only eaten when it is very soft and almost at the point of going rotten). The fruit of trees in a fairly sunny position at Kew ripens on the tree in most years and produces fertile seed[K]. The fruit contains about 1.9% protein, 0.2% fat, 47.7% carbohydrate, 1% ash[179]. Fruits are about the size of a large cherry, they turn from yellow to blue-black when fully ripe[183]. The fruit is about 20mm in diameter[200].

tcanta Rootstock WoodSometimes used as a rootstock for D. kaki[183]. Wood - durable, pliable, resists rot. Used for construction, general carpentry etc[74].

dwatta Febrifuge SedativeThe fruit is febrifuge[178, 240]. It is also used to promote secretions[240]. The seed is regarded in China as being sedative[240].

nrakta E. Asia - China, Japan. Himalayas. ksacta Mixed mountain forests to 1500 metres in China[74].

propta Seed - best sown in a cold frame as soon as it is ripe[113, 200]. Stored seed requires a period of cold-stratification and should be sown as early in the year as possible[78]. It usually germinates in 1 - 6 months at 15°c[175]. Pot up the young seedlings as soon as they are large enough to handle into fairly deep pots and plant them out into their permanent positions in early summer. Give them some protection from winter cold for their first year or two outdoors. Cuttings of half-ripe wood, July/August in a frame[200]. Layering in spring[200].

nwatta Requires a good deep loamy soil in sun or light be discovered by When being grown for its fruit, the tree should be given a warm, sheltered, sunny position[K]. It dislikes very acid or wet and poorly drained soils[200]. Dormant plants are very cold-hardy, but the young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Dioecious, but the female tree can produce seedless fruits in the absence of a pollinator[1]. It is likely that unfertilized fruits are more astringent than fertilized fruits since this is the case with D. kaki[K]. Plants have a long tap root and are difficult to transplant[200], it is best to plant them out in their permanent position as soon as possible and to give protection

overwinter for the first year or two[K]. This species is sometimes cultivated for its edible fruit in Italy and E. Asia, there are some named varieties[142, 183].

#### 8.2.3 Atriplex halimus

Sea Orach, Saltbush

7 tlin 10 cyuc 5 kcak 3 tcan 1 dwat 2 m hkuc

htut cyutli ngatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli hjonli

drutta Atriplex halimus is an evergreen Shrub growing to 2 m (6ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower in July. The species is monoccious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista No member of this genus contains any toxins, all have more or less edible leaves. However, if grown with artificial fertilizers, they may concentrate harmful amounts of nitrates in their leaves.

kcakta Edible Parts: Leaves Manna SeedEdible Uses: Leaves - raw or cooked[2, 46, 61, 177]. Some forms are eaten raw[177]. A famine food according to one report[177], but in our opinion it is far from being a famine food, in fact this is one of the more popular crops being grown at 'The Field' at present (1993)[K]. The leaves have a very nice rather salty flavour, they go well in salads or can be cooked like spinach[K]. When lightly steamed, the leaves retain their crispness and are a delicious spinach substitute[K]. The leaves retain their salty flavour even when grow inland in non-salty soils[K]. The leaves can be used at any time of the year though winter harvesting must be light because the plant is not growing much at this time[K]. Seed - cooked[85]. It can be ground into a meal and used as a thickener in soups, or mixed with cereals in making bread. The seed is small and fiddly. The plant is said to yield an edible manna[183].

tcanta Hedge Hedge Soap making Soil reclamationThe ash from the burnt plant is used as the alkali in making soap[46, 61]. The plant makes a superb wind-resistant low-growing hedge that can be allowed to grow untrimmed or can be trimmed[K]. It is especially valuable in maritime areas, succeeding right on the coast, though can also be used inland[75, 182, K]. The plant is extremely tolerant of pruning and can regrow even when cut back into old wood[K]. The plant draws salt out of the soil and so has been used in soil-reclamation projects to de-salinate the soil[K].

dwatta CarminativeThe shoots are burnt to produce an antacid powder[238].

nrakta S. Europe. Occasionally naturalized in Britain[200]. ksacta Coastal sands by the sea[1, 100]. Saltmarshes[200].

propta Seed - sow April/May in a cold frame in a compost of peat and sand. The seed usually germinates in 1 3 weeks at 13°c[134]. Pot up the seedlings when still small into individual pots, grow on in a greenhouse for the first winter and plant out in late spring or early summer after the last expected frosts. The seed is seldom formed[200]. Cuttings of half-ripe wood, July/August in a frame. Very easy. Pot up as soon as they start to root (about 3 weeks) and plant out in their permanent positions late in the following spring[K]. Cuttings of mature wood of the current season's growth, November/December in a frame. Very easy. Pot up in early spring and plant out in their permanent position in early summer[K].

nwatta An easily grown plant, it succeeds in full sun in any well-drained but not too fertile soil[182, 200]. Tolerates saline and very alkaline soils[200]. Succeeds in dry soils including pure sands[49, 75]. Plants will grow in semi-shade, though they will soon become leggy in such a position, they are really best in full sun[K]. A very wind hardy plant, it is resistant to salt-laden gales[75], and can be used as a hedge in maritime areas[182]. Plants dislike very wet climates[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5

and -10°c[200]. This plant is hardier than the foregoing report suggests, it grows well at Hilliers Arboretum in Hampshire where temperatures can fall somewhat lower than -10°c[K]. Plants can be damaged by severe frosts but they soon recover[11]. Resents root disturbance when large[134]. Plants are apt to succumb to winter wet when grown on heavy or rich soils[182]. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc., and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is branching: a heart root, dividing from the crown into several primary roots going down and out [2-1].

# 8.2.4 Rubus loganobaccus

Loganberry

7 tlin 10 cyuc 5 kcak 1 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Rubus loganobaccus is a deciduous Shrub growing to 2.5 m (8ft) by 2.5 m (8ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Apomictic (reproduce by seeds formed without sexual fusion). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 3, 34, 61, 171]. A pleasant acid flavour, it usually crops heavily[K]. The fruit is up to 4cm in diameter[200].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168].

nrakta Probably a hybrid between R. ursinus and the raspberry 'Red Antwerp'. Rarely naturalized in Britain. ksacta Not known in a truly wild situation.

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°c and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Tolerates all but the most alkaline soils[202]. Plants dislike exposed windy situations[K]. Hardy to about -18°c[202]. Often cultivated for its edible fruit in temperate countries, there are some named varieties[61], including forms with thornless stems[200]. 'LY654' is a thornless form with good flavour[200]. This species has fast-growing biennial stems[202], it produces a number of new stems each year from the perennial rootstock, these stems fruit in their second year and then die[200]. The plant produces apomictic flowers, these produce fruit and viable seed without fertilization, each seedling is a genetic copy of the parent[200]. Plants in this genus are notably susceptible to honey fungus[200]. Closely related to R. ursinus[200]. Plants are liable to attacks of raspberry cane spot and mildew, otherwise they are one of the most reliable of the fruiting members of this genus[202].

#### 8.2.5 Campanula versicolor

7 tlin 10 cyuc 5 kcak 0 tcan 0 dwat 1.2 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli fyifxre7t hjonli

drutta Campanula versicolor is a PERENNIAL growing to 1.2 m (4ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beethes, Lepidoptera (Moths and Butterflies). The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves - raw or cooked[46, 61, 105]. Rich in vitamin C. A delicious mild flavour with a slight sweetness that reminds people of freshly-picked garden peas, they can be added in quantity to salads and are usually available in winter[K]. They are liked by most people who try them[K]. Flowers - raw. Very pleasant with a slight sweetness, they make a tasty and decorative addition to salads[K].

nrakta Europe - Greece. ksacta Rocky places[50] in the lower wood region[221].

propta Seed - surface sow spring in a cold frame. The seed usually germinates in 2 - 4 weeks at 18°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer. Basal cuttings in spring[200]. Once they are a few years old, plants produce a number of rosettes and these can be carefully removed in the spring and used as cuttings[221]. Harvest the shoots when they are about 10 -15cm long with plenty of underground stem. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Root cuttings are said to work[221]. The plant has a thick fleshy root with a number of crowns. Whilst this can be divided if great care is taken not to damage the root, it is not really recommended because the divisions take a long time to become established[221].

nwatta Succeeds in most fertile well-drained soils[233], though it prefers a sunny position in a moist but welldrained rich sandy loam and a neutral or alkaline soil[1, 200]. Strongly resents winter wet[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants may require protection in severe winters[1], though they have proved reliable in Cornwall[K]. This species provides some of the nicest salad leaves that we have tried to date, it has an excellent potential as an edible ornamental in the garden, though it is not really suitable for commercial cultivation[K]. The plants have a basal rosette in winter and continue to grow slowly in all but the coldest weather, providing edible leaves most winters[K]. The species in this genus do not often hybridize and so seed can generally be relied upon to come true[221]. The plants are self-fertile[221]. A very ornamental plant[1]. It is closely related to C. pyramidalis, but is more reliably perennial[221]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.6 Ugni molinae

Uñi, Chilean guava

7 tlin 11 cyuc 5 kcak 3 tcan 0 dwat m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ugni molinae is an evergreen Shrub growing to 2 m (6ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from May to July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pff: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

drutta Abutilon megapotamicum is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers-cooked. Used as a vegetable[183]. A pleasant sweet flavour, we find them delicious to eat raw[K]. The flowers are produced from mid spring until the autumn - they produce nectar all the time they are open so, assuming the plant is grown indoors and is not visited by pollinating insects, the sweetness increases the longer the flower is open[K].

nrakta S. America - Brazil. ksacta Widely cultivated in the Tropics and not known in a truly wild situation.

propta Seed - sow spring in a greenhouse[200]. Germination should take place within a few weeks. Once the seedlings are large enough to handle, prick them out into individual pots. Grow them on for at least the first winter in a greenhouse and plant out in late spring or early summer, after the last expected frosts. Cuttings of young shoots, June in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts.

nwatta Requires a sunny position or part day shade in a fertile well-drained soil[200]. Dislikes drought[200]. This species is only hardy in the mildest areas of Britain, tolerating temperatures down to between -5 to -10°c when given the protection of a south or south-west facing wall[11, 184, 200]. A deep mulch in winter and tving in growth to the wall will maximise protection in winter[200]. If the plant is cut back by cold weather, it will normally resprout from the base in the spring and can flower on the current year's growth[202]. Dead-heading plants to prevent seeding can enhance longevity[200]. Tip-prune young plants to promote a bushy habit, older plants can be cut back hard annually in spring if required[200]. There are some named forms, selected for their ornamental value [200]. There is a variegated form in cultivation, this variegation is as a result of infection by abutilon mosaic virus[184, 200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.21 Arbutus x andrachnoides

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Arbutus x andrachnoides is an evergreen Tree growing to 10 m (32ft) by 8 m (26ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from October to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[K]. A pleasant texture with a sweet but delicate flavour, the fruit is considered to be insipid by many people[K]. Very similar in size and taste to the strawberry tree, A. unedo[K], though it is not usually borne very freely[200].

nrakta S.E. Europe to W. Asia. ksacta Not known

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse[78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at 20°c[134]. Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. This species is a hybrid and is unlikely to breed true from seed. Basal cuttings in late

winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of young wood - can take 2 years[1, 200].

nwatta Prefers a lime-free nutrient-rich well-drained moisture-retentive soil in a sunny position with shelter from cold drying winds, especially when young[200]. Unlike most members of this genus, this species thrives on a limy soil[184, 200]. Plants are hardy to about -15°c[184]. A naturally occurring hybrid between A. unedo and A. andrachne[200]. There are some named forms, selected for their ornamental value[200]. Trees rarely produce fruit in Britain[200]. Plants resent root disturbance and are best placed in their final positions whilst young[11, 134]. Give them some protection in their first winter. Plants sometimes flower in the spring, but more usually in the late autumn and early winter.

#### 8.2.22 Cornus elliptica

wisslip hpa7tmwatli xre7t hionli

7 tlin 10 cyuc 4 kcak 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprikl-

drutta Cornus elliptica is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pfr. mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: The fully ripe fruit is sweet and edible[266]. The fruit is up to 25mm in diameter[266].

tcanta WoodWood - hard. It is used for making tools[266].

nrakta E. Asia - western China. ksacta Forests, slopes, streamsides at elevations of 300 - 2200 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80. 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta We have very little information on this species and so are not sure how hardy it is in the temperate zone. It is, however, very closely related to C. capitata and is likely to be of similar hardyness. The following notes are for C. capitata. An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[[188]. Prefers semi-shade[219]. This species is hardy to between -5 and -10°c[184], it grows very well in S.W. England, self-sowing and fruiting prolifically in Cornish woodland gardens[11, 49, 59, , 104, 182] and doing well by the coast where it tolerates sea winds[182]. Plants are not hardy in the London area, being killed even when on a south-facing wall[11]. Another report says that it succeeds as far north as Edinburgh. Squirrels are very fond of this fruit[166]. Plants in this genus are notably resistant to honey fungus[200]

# 8.2.23 Cephalotaxus wilsoniana

7 tlin 10 cyuc 4 kcak 0 tcan 0 dwat 10 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

These non-astringent forms require a warmer climate and do not ripen in cooler areas[183]. The astringent cultivars are somewhat hardier and ripen well in cooler climates than the non-astringent forms[183]. The fruit colours better and is sweeter in warmer areas but in hot conditions has a poor texture and deep black spots develop[183]. If allowed to become very ripe (almost to the point of going rotten), they develop a better flavour than non-astringent forms[183]. Dioecious, but the female tree can produce seedless fruits in the absence of a pollinator. However, unfertilized fruit tends to be smaller and more astringent[200]. This astringency is due to the high content of tannin but once the fruit is fully ripe it loses this astringency and becomes sweet[132]. If fertilized fruit is required, then growing one male for every 8 - 10 females is usually adequate [238]. Special Features: Edible, Not North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 10 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a nonsuckering single trunk [1-2]. The root pattern is a tap root similar to a carrot going directly down [1-2].

#### 8.2.18 Cornus capitata

Bentham's Cornel

7 tlin 10 cyuc 4 kcak 3 tcan 1 dwat 12 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslio hpa7tmwatli xre7t hionli

drutta Cornus capitata is an evergreen Tree growing to 12 m (39ft) by 12 m (39ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A bitter-sweet flavour[2, 105, 183], tasting like an over-ripe banana[166]. The fruit can also be used in preserves[51, 146]. The fruit is about 25mm in diameter[200], it is fleshy with a number of seeds and a tough slightly bitter skin[K]. Our experience is that some trees can produce quite pleasant tasting fruits, but many others produce fruit with a distinct and unpleasant bitterness[K]. The fruit ripens in late autumn to early winter and will fail to ripe properly if the weather is very cold[K].

tcanta Fuel Tannin WoodThe branches and leaves are a source of tannin[266]. Wood - very hard, close grained but warps when being seasoned. Used mainly for fuel[158, 272] and for making tools[266].

dwatta AstringentThe bark is used medicinally[266]. No further information is given, though the bark is a source of tannin which is used as an astringent[K].

nrakta E. Asia - China to the Himalayas. ksacta Forests and shrubberies to 3400 metres in the Himalayas[51]. Moist hillsides at elevations of 1700 - 2600 metres in Nepal[272]. Evergreen and mixed forests, 1000 - 3200 metres

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 113]. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the

seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage[78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[[188]. Prefers semi-shade[219]. This species is hardy to between -5 and -10°c[184], it grows very well in S.W. England, self-sowing and fruiting prolifically in Cornish woodland gardens[11, 49, 59, , 104, 182] and doing well by the coast where it tolerates sea winds[182]. Plants are not hardy in the London area, being killed even when on a south-facing wall[11]. Another report says that it succeeds as far north as Edinburgh. Squirrels are very fond of this fruit[166]. This species has been known to hybridize with C. kousa, the cultivar 'Norman Hadden' could be such a hybrid[182]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.19 Wyethia mollis

Woolly Wyethia, Woolly mule-ears 7 tlin 10 cyuc 4 kcak 0 tcan 1 dwat m hkuc

htut cyutli hgattcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Wyethia mollis is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate droudht.

pcista One report suggests that the leaves might be poisonous[94].

kcakta Edible Parts: Root SeedEdible Uses: Root -cooked. A sweet and agreeable flavour[94]. The N. American Indians dug pits in the ground which they lined with large stones. They then burnt a fire on top of the stones until the stones were hot. The roots were placed on these hot stones, sealed in with fern leaves and earth and then fermented for one or two days[94]. Seed - raw or cooked[257]. The seed can be used as a mush or mixed with cereals flours to make bread etr[257]

dwatta Antiphlogistic Blood tonic Diaphoretic Emetic Febrifuge PoulticeThe root is antiphlogistic, diaphoretic, emetic and febrifuge[94, 257]. A decoction has been used as a blood tonic and also in the treatment of tuberculosis, venereal diseases, colds and fevers[257]. A poultice of the crushed roots has been applied to swellings[257]. A poultice of the crushed leaves has been applied to sprains, swellings and broken bones[257].

nrakta South-western N. America - Oregon to California. ksacta Dry wooded slopes and rocky openings, 1500 - 3000 metres in California[71].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse or cold frame in early spring. Use a very freely-draining compost, prick out the seedlings into individual pots as soon as they are large enough to handle and plant out into their permanent positions when they are large enough. Careful division of the crown as the plants come into growth in spring[200].

nwatta Requires a free-draining, gritty but moistureretentive soil in a sunny position[200]. This species is more tolerant of drought than other members of the genus[200]. Plants are not hardy in the colder areas of Britain[200].

# 8.2.20 Abutilon megapotamicum

Trailing Abutilon

77 tlin 10 cyuc 4 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli kcakta Edible Parts: Fruit Leaves SeedEdible Uses: Coffee TeaFruit - raw or cooked[2, 3]. An absolutely delicious flavour, it is very aromatic and tastes of wild strawberries[11, 15, K]. The fruit is about 15mm in diameter[196] and is freely borne even on small plants[K]. Leaves are a tea substitute[177, 183]. The roasted seeds are a coffee substitute[183].

tcanta Hedge HedgeTolerant of trimming, it can be grown as a small hedge in the milder parts of Britain[11].

nrakta S. America - Chile. ksacta Woodland edges and scrub[11, 184].

propta Pre-soak the seed for 24 hours in warm water and then sow it in late winter in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Pot up in the autumn and overwinter in a cold frame. Plant out in late spring. High percentage[78]. Cuttings of mature wood of the current seasons growth, 7 - 12cm with a heel, November in a shaded and frost free frame. Plant out in late spring or early autumn. High percentage[78]. Layering.

nwatta Succeeds in any reasonably good soil including[1] dry ones. Prefers a moderately fertile well-drained loam in a sunny position[11, 200]. Fairly tolerant of maritime exposure[K]. Established plants are drought resistant[196]. A very ornamental plant[1], it is only hardy in the milder parts of Britain[3], tolerating temperatures down to about -10°c when fully dormant[184]. The young growth in spring can be damaged by late frosts. Plants grow and fruit very well in Cornwall, indeed, in the past it has been cultivated commercially for its fruit there[11, 59] (it was one of Queen Victoria's favourite fruits), but is now normally only grown as an ornamental plant. This is a much underused plant that highly merits cultivation on a commercial scale for its fruit[K]. Flowers and fruits well even when the plants are young[11, 166]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.7 Rubus nepalensis

Nepalese Raspberry

7 tlin 10 cyuc 5 kcak 3 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasilutnyik hpa7tl

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Rubus nepalensis is an evergreen Shrub growing to 0.2 m (0ft 8in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is polinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1, 105]. A very well flavoured and reasonably sized raspberry with just a little sourness[K]. It generally fruits well in the garden, though there are some forms that produce very little fruit, or poorly shaped fruits[K].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168]. An excellent ground-cover plant, forming a quite effective weed-suppressing mulch[K].

nrakta E. Asia - Himalayas. ksacta Rocks, banks and shrubberies to 3300 metres[51].

propta Seed - requires stratification, is best sown in early autumn in a cold frame. Sow stored seed as early as possible in the year in a cold frame and stratify for a month at 3°c if sowing later than February. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Tip layering in July. Plant out in autumn. Division in early spring. Very easy, the plants can be divided successfully at almost any time of the year. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a

cold frame, planting them out once they are well established in the summer.

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Prefers a sheltered semishady position[11]. Plants survive considerable neglect, they can grow and spread in long grass though they do not fruit well in such a position[K]. Plants are not very drought tolerant[K]. The Nepalese raspberry is a very ornamental plant, though it loses some of its leaves in a cold winter and can look a little bedraggled at this time[K]. It is also unhappy in exposed maritime situations and in a sunny position in very hot summers. A report that this species is not hardy in zones colder than 9 is very questionable, the plant has survived guite hard frosts with us in Cornwall and grows happily at Kew Gardens[K]. There is also a clump growing successfully in a sheltered position in the semi-shade of trees at Cambridge Botanical gardens, this fruited guite well in the summer of 1996[K]. Plants in this genus are notably susceptible to honey fungus[200]. In garden design, as well as the aboveground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is suckering with new plants from runners away from the plant [2-1].

# 8.2.8 Allium triquetrum

Three-Cornered Leek

7 tlin 10 cvuc 5 kcak 0 tcan 2 dwat 0.4 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Allium triquetrum is a BULB growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf from February to July, in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in very large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. The rather small bulb is up to 20mm in diameter[200], it has a mild garlic flavour and can be used as a flavouring in salads and cooked foods. It is harvested in early summer when the plant has died down and will store for at least 6 months[K]. Leaves - raw or cooked. A leek substitute[22]. The leaves are available from late autumn until the spring, they are nice in salads when they are young, or cooked as a vegetable or flavouring as they get older[K]. The leaves have a milder and more delicate flavour than onions[183]. Flowers - raw. Juicy with a mild garlic flavour, they make a tasty and decorative garnish on salads[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta S. Europe. Naturalized in Britain in S.W. England[17]. ksacta Hedge banks and waste places on damp soils[17, 90].

propta Seed - best sown as soon as it is ripe in a greenhouse or cold frame. It germinates quickly and can be grown on in the greenhouse for the first year, planting out the dormant bulbs in the late summer of the following year if they have developed sufficiently, otherwise grow on in pots for a further year. Stored seed can be sown in spring in a greenhouse. Division in summer after the plants have died down. Very easy, the divisions can be planted straight out into their permanent positions.

nwatta Prefers a rich moist but well-drained soil[1, 42]. Shade tolerant[31], it is easily grown in a cool leafy soil[90] and grows well in light moist woodland[203]. Plants are not very hardy outside the milder areas of Britain, they tolerate temperatures down to between -5 and -10°c. The bulbs should be planted fairly deeply[1]. The seeds have an oilbearing appendage which is attractive to ants. The ants carry the seed away to eat the oil and then discard the seed, thus aiding dispersal of the plant[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a had companion for alfalfa, each species negatively affecting the other[201]. The flowers are sweetly scented[245]. The picked flowers can remain fresh for several weeks[89]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.9 Allium sativum ophioscorodon

Sernent Garlic

7 tlin 10 cyuc 5 kcak 4 tcan 5 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Allium sativum ophioscorodon is a BULB growing to  $0.6\ m$  (2ft) by  $0.2\ m$  (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista There have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of this species. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Bulb - raw or cooked. Widely used, especially in southern Europe, as a flavouring in a wide range of foods, both raw and cooked[244]. Garlic is a wonderfully nutritious and health giving addition to the diet, but it has a very strong flavour and so is mainly used in very small quantities as a flavouring in salads and cooked foods[2, 9, 14, 27, 33]. A nutritional analysis is available[218]. The bulbs can be up to 6cm in diameter[200]. Bulbils - raw or cooked[K]. An excellent strong garlic flavour, though they are rather small and therefore fiddly to peel[K]. Leaves - raw or cooked. Chopped and used in salads, they are rather milder than the bulbs[200, K]. The Chinese often cultivate garlic especially for the leaves, these can be produced in the middle of winter in mild winters[206]. The flowering stems are used as a flavouring and are sometimes sold in Chinese shops[183]. The sprouted seed is added to salads[183].

tcanta Adhesive Fungicide RepellentThe juice from the bulb is used as an insect repellent[7, 14]. It has a very strong smell and some people would prefer to be bitten[K]. The juice can also be applied to any stings in order to ease the pain[7, 14]. 3 - 4 tablespoons of chopped garlic and 2 tablespoons of grated soap can be infused in 1 litre of boiling water, allowed to cool and then used as an insecticide[201]. An excellent glue can be made from the juice[7], when this is spread on glass it enables a person to cut clean holes in the glass[7], The juice is also used as a glue in mending glass and china[46]. An extract of the plant can be used as a fungicide[18]. It is used in the treatment of blight and mould or fungal diseases of tomatoes and potatoes[201]. If a few cloves of garlic are spread amongst stored fruit, they will act to delay the fruit from rotting[7]. The growing plant is said to repel insects, rabbits and moles[14, 20].

dwatta Anthelmintic Antiasthmatic Anticholesterolemic Antiseptic Antispasmodic Cancer Cholagogue Diaphoretic Diuretic Dysentery Expectorant Febrifuge Stimulant Stings Stomachic Tonic VasodilatorGarlic has a very long folk history of use in a wide range of ailments, particularly ailments such as ringworm, Candida and vaginitis where its fungicidal, antiseptic, tonic and parasiticidal properties have proved of benefit[218]. The plant produces inhibitory effects on gram-negative germs of the typhoid-paratyphoid-enteritis group, indeed it possesses outstanding germicidal properties[240] and can keep amoebic dysentery at bay[244]. It is also said to have anticancer activity[218]. It has also been

shown that garlic aids detoxification of chronic lead poisoning[244]. Daily use of garlic in the diet has been shown to have a very beneficial effect on the body, especially the blood system and the heart. For example, demographic studies suggest that garlic is responsible for the low incidence of arteriosclerosis in areas of Italy and Spain where consumption of the bulb is heavy[222]. Recent research has also indicated that garlic reduces glucose metabolism in diabetics, slows the development of arteriosclerosis and lowers the risk of further heart attacks in myocardial infarct patients[238, 254]. Externally, the expressed juice is an excellent antiseptic for treating wounds[244]. The fresh bulb is much more effective medicinally than stored bulbs, extended storage greatly reduces the anti-bacterial action[244]. The bulb is said to be anthelmintic, antiasthmatic, anticholesterolemic, antiseptic, antispasmodic, cholagogue, diaphoretic, diuretic, expectorant, febrifuge, stimulant, stings, stomachic, tonic, vasodilator[4, 9, 14, 21, 46, 165].

nrakta C. Asia? Original habitat is obscure. ksacta Not known in a truly wild situation.

propta Plant out the cloves in late autumn for an early summer crop[33, 200]. They can also be planted in late winter to early spring though yields may not be so good. Plant the cloves with their noses just below the soil surface[200]. If the bulbs are left in the ground all year, they will often produce tender young leaves in the winter[Kl. Bulbils, harvested in late summer, are best sown immediately in pots in a cold greenhouse, planting out in late spring after the last expected frosts[Kl. They can also be stored in a cool place over the winter and then be planted outdoors like onion sets. They will not make such a big plant in their first year, however[Kl.

nwatta Succeeds in most soils but prefers a sunny position in a moist light well-drained soil[1, 14, 16, 37]. Dislikes very acid soils[206]. Tolerates a pH in the range 4.5 to 8.3. The bulb is liable to rot if grown in a wet soil[27, 52]. Hardy to at least -10°c[206]. The bulbs should be planted fairly deeply[1]. Garlic is widely cultivated in most parts of the world for its edible bulb, which is used mainly as a flavouring in foods. This sub-species differs mainly in forming more bulbils on the flowering head, and this flowering head usually coils into 1-2 loops before opening[200]. Since it produces these bulbils (which make an excellent garlic, though they are rather on the small side) as well as underground cloves, it can be more productive[K]. We often grow this plant for a number of years before digging it up - it forms larger and larger clumps each year, with an abundance of bulbils[K]. There are a number of named varieties[183]. Bulb formation occurs in response to increasing daylength and temperature[200]. It is also influenced by the temperature at which the cloves were stored prior to planting. Cool storage at temperatures between 0 and 10°c will hasten subsequent bulb formation, storage at above 25°c will delay or prevent bulb formation[200, 206]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing

# 8.2.10 Allium sativum

Garlic, Cultivated garlic

7 tlin 10 cyuc 5 kcak 4 tcan 5 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Allium sativum is a BULB growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista There have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of this species. Dogs seem to be particularly susceptible[76]. Avoid with anticlotting medication. Breastfeeding may worsen baby's colic. Avoid several weeks prior to surgery. Bad breath!! [301]. of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc, for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - soft, light, close-grained[82].

dwatta PoulticeThe gum exuding from damaged areas of the tree is used to treat sore throats[92, 117]. The turpenine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

nrakta Southern N. America. ksacta Hot arid mountain slopes above 2000 metres, with juniper and scrub oak[82, 181]

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are guite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

mwatta Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought, succeeding in hot dry positions[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between 5 and -10°c[200]. Leaf secretions inhibit the germination of seeds, thereby inhibiting the growth of other plants below the tree[18]. Slow growing[81, 120], it takes 25 years from seed before cones are formed[117]. The tree takes 250 - 350 years to reach full maturity[181]. The cones open and shed their seed whilst still attached to the tree[226]. This sub-species has larger seeds than the type[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Plants in this genus are notably susceptible to honey fungus[200].

# 8.2.17 Diospyros kaki

Persimmon, Japanese persimmon

7 tlin 10 cyuc 4 kcak 3 tcan 3 dwat 12 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Diospyros kaki is a deciduous Tree growing to 12 m (39ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to August, and the seeds ripen in November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Coffee Condiment SweetenerFruit - raw or cooked[1, 2, 3, 7, 46, 61]. The fruit has an exquisitely rich flavour when it is very soft and fully ripe (almost at the point of going bad), but the fruit of many cultivars is very harsh and astringent before then[K] In Britain, the fruit needs to be harvested whilst it is still very hard. This is done very late in the season (in December or even January if possible), it is then stored in a cool but frost-free place until very soft and fully ripe[K]. The fruit can also be used in pies, cakes, bread, desserts etc[183]. It contains 25% sugars[74]. A fuller nutritional analysis is available[218]. The fruit can also be dried for later use[183]. The fruit is about 7.5cm in diameter[200]. The peel of the fruit can be powdered and used as a sweetener[183]. The leaves are used to improve the flavour of pickled radishes [183]. The roasted seeds are a coffee substitute[183, 240].

tcanta Cosmetic WoodThe pulp of unripe fruits is used in cosmetics to make face-packs because of its firming qualities[7]. Wood - hard and durable with a beautiful grain. Used for making fine furniture[266].

dwatta Anthelmintic Antitussive Antivinous Appetizer Astringent Demulcent Expectorant Febrifuge Hypotensive Laxative Sialagogue Stomachic StypticAppetizer, sialagoque[116, 176, 178]. The stem bark is astringent and styptic[218]. The fruit is said to have different properties depending on its stage of ripeness, though it is generally antitussive, astringent, laxative, nutritive and stomachic[218, 238]. The fresh fully ripe fruit is used raw in the treatment of constipation and haemorrhoids[238] and when cooked is used to treat diarrhoea[238].. The dried ripe fruit is used in the treatment of bronchial complaints[238], whilst when ground into a powder it is used to treat dry coughs[238]. Juice from the unripe fruit is used in the treatment of hypertension[218, 238]. The fruits, picked green and ripened in containers with the leaves, become very sweet and are considered to be antifebrile, antivinous and demulcent[218]. The fruits are also peeled and then exposed to sunlight by day and dew by night. They become encrusted with a white powder and are then considered to be anthelmintic, antihaemorrhagic, antivinous, expectorant, febrifuge and restorative[218]. The peduncle is used to treat coughs and hiccups[218]. The calyx is used to treat hiccups[176].

nrakta E. Asia - China, Japan. ksacta Not known in a truly wild situation, it is found in broad leafed woodland but probably as an escape from cultivation[74, 200].

propta Seed - best sown in a cold frame as soon as it is ripe[113, 200]. Stored seed requires a period of cold-stratification and should be sown as early in the year as possible[78]. It usually germinates in 1 - 6 months at 15°c[175]. Pot up the young seedlings as soon as they are large enough to handle into fairly deep pots and plant them out into their permanent positions in early summer. Give them some protection from winter cold for their first year or two outdoors. Cuttings of half-ripe wood, July/August in a frame[200]. Layering in spring[200].

nwatta Landscape Uses: Pest tolerant. Prefers a good deep loamy soil in sun or light shade but succeeds in most soils[11, 132, 200]. Dislikes very acid or wet and poorly drained soils[200]. Requires a sheltered position[200]. Dormant plants are quite hardy in Britain, tolerating temperatures down to about -14°c[74], but they require warmer summers than are normally experienced in Britain in order to ripen their fruit and wood[3]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A warm sunny wall improves the chance of producing ripe fruit[3] and trees fruit freely when grown under glass[1]. Fruits are frequently produced outdoors at Kew[11, K]. A tree seen in a open position with afternoon shade at Kew in November 1993 (after a cool summer) had about 200 almost ripe fruits around 8cm in diameter[K]. The same tree, after a fairly warm summer in 1996, had a large quantity of fruit just about ready for harvesting in the middle of December[K]. Trees produce a long taproot and should be planted out into their permanent positions as soon as possible[200]. The young trees require some winter protection for their first winter or two[K]. The persimmon is widely cultivated for its edible fruit in warm temperate areas of the world, especially in Japan and China, there are many named varieties[183]. Some cultivars, such as 'Fuyu', lack the usual astringency and can be eaten whilst still firm, though they develop a richer flavour if allowed to become soft[183, 200].

ative, anthelmintic, anti-inflammatory, astringent and depurative[9, 218]. They are used internally the treatment of constipation, chronic coughs, asthma, diarrhoea, dyspepsia etc[9]. The leaves are also used to treat skin ailments and purify the blood[9, 218]. They are considered to be specific in the treatment of strumous sores[240]. Male inflorescences are made into a broth and used in the treatment of coughs and vertigo[218]. The rind is anodyne and astringent[147]. It is used in the treatment of diarrhoea and anaemia[238]. The seeds are antilithic, diuretic and stimulant[218]. They are used internally in the treatment of low back pain, frequent urination, weakness of both legs, chronic cough, asthma, constipation due to dryness or anaemia and stones in the urinary tract[176]. Externally, they are made into a paste and applied as a poultice to areas of dermatitis and eczema[176]. The oil from the seed is anthelmintic[218]. It is also used in the treatment of menstrual problems and dry skin conditions[238]. The cotyledons are used in the treatment of cancer[218]. Walnut has a long history of folk use in the treatment of cancer, some extracts from the plant have shown anticancer activity[218]. The bark and root bark are anthelmintic, astringent and detergent[218, 240]. The plant is used in Bach flower remedies - the keywords for prescribing it are 'Oversensitive to ideas and influences' and 'The link-breaker'[209].

nrakta E. Europe to N. Asia. More or less naturalized in S. Britain. ksacta Forests in the Himalayas, preferring a northerly aspect in the west but a southerly or westerly aspect in the east of the range[144].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80, 113]. Named varieties are propagated by budding

nwatta Global Crop Management: Standard Other Systems: Irreg. Intercrop Other Systems: Strip intercrop Staple Crop: Protein-oilLandscape Uses:Aggressive surface roots possible, Specimen. Requires a deep welldrained loam[11] and a sunny position sheltered from strong winds. Prefers a slightly alkaline heavy loam but succeeds in most soils[1, 63]. The walnut tree is reported to tolerate an annual precipitation of 31 to 147cm, an annual temperature in the range of 7.0 to 21.1°C and a pH in the range of 4.5 to 8.2[269]. The dormant plant is very cold tolerant, tolerating temperatures down to about -27°C without serious damage, but the young spring growth is rather tender and can be damaged by late frosts[269]. Some late-leafing cultivars have been developed, these often avoid damage from spring frosts and can produce a better quality timber tree. The walnut tree is frequently cultivated for its edible seed in temperate zones of the world, there are many named varieties[63, 183]. Newer cultivars begin producing nuts in 5 - 6 years; by 7 - 8 years, they produce about 2.5 tons of nuts per hectare[269]. Orchards on relatively poor, unirrigated mountain soil report 1.5 - 2.25 tonnes per hectare, orchards in well cultivated valleys, 6.5 - 7.5 tonnes per hectare[269]. According to the Wealth of India, a fully grown individual can yield about 185 kg, but 37 kg is more likely[269]. Trees grow well in most areas of Britain but they often fail to fully ripen their fruits or their wood in our cooler and damper climate[63, 200], they prefer a more continental climate. There are some very fine trees in Cornwall[59]. Walnuts can produce large healthy trees in many parts of Britain, but seedling trees often do not fruit reliably. Some European varieties have been developed that succeed in colder areas[200]. Seedling trees are said to take from 6 to 15 years to come into fruit from seed[200], but these cultivars usually start cropping within 5 years. Plants produce a deep taproot and they are intolerant of root disturbance. Seedlings should be planted out into their permanent positions as soon as possible and given some protection for their first winter or two since they are somewhat tender when young. Flower initiation depends upon suitable conditions in the previous summer. The flowers and young growths can be destroyed by even short periods down to -2°c[63], but fortunately plants are usually late coming into leaf. Some cultivars are self-fertile, though it is generally best to grow at least two different cultivars to assist in cross-pollination. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise wounds will bleed profusely and this will severely weaken the tree. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots also produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. Trees have a dense canopy which tends to reduce plant growth below them[20]. All in all, not the best of companion trees, it is also suggested that the trees do not like growing together in clumps [37]. Trees are said to inhibit the growth of potatoes and tomatoes[18]. Hybridizes with J. nigra[149]. This species is notably susceptible to honey fungus[200]. The bruised leaves have a pleasant sweet though resinous smell[245]. Special Features: Not North American native, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 7 through 1. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone, 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

#### 8.2.16 Pinus cembroides orizabensis

Mexican Pine Nut

7 tlin 10 cyuc 4 kcak 3 tcan 2 dwat 15 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dyat hionli

drutta Pinus cembroides orizabensis is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The wood, sawdust and resins from various species of pine can cause dermatitis in sensitive people[222].

kcakta Edible Parts: Inner bark SeedEdible Uses: CondimentSeed - the oily seed kernel is eaten raw, roasted, ground into a powder for making bread, cakes etc or made into a nut butter[1, 2, 11, 34, 62, 63, 92, 94, 183]. A very good size, the seed is up to 20mm long[200]. Said to be the highest in protein and lowest in starch of all the piñons[183]. The seed contains about 14.6% protein, 62% fat. 17.3% carbohydrate[85]. This species provides a major source of seeds for sale in America[200]. Inner bark - only used in times of dire need[85]. There are no more details but inner bark is often dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dye Herbicide Pitch WoodA tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. A gum pitch is used as a glue for waterproofing and repairing pottery[117]. Oleoresins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile[64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists

kcakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Bulb - raw or cooked. Widely used, especially in southern Europe, as a flavouring in a wide range of foods, both raw and cooked[244]. Garlic is a wonderfully nutritious and health giving addition to the diet, but it has a very strong flavour and so is mainly used in very small quantities as a flavouring in salads and cooked foods[2, 9, 14, 27, 33]. A nutritional analysis is available[218]. The bulbs can be up to 6cm in diameter[200]. Leaves - raw or cooked. Chopped and used in salads, they are rather milder than the bulbs[200, K]. The Chinese often cultivate garlic especially for the leaves, these can be produced in the middle of winter in mild winters[206]. The flowering stems are used as a flavouring and are sometimes sold in Chinese shops[183]. The sprouted seed is added to salads[183].

tcanta Adhesive Fungicide RepellentThe juice from the bulb is used as an insect repellent [7, 14]. It has a very strong smell and some people would prefer to be bitten[K]. The juice can also be applied to any stings in order to ease the pain[7, 14]. 3 - 4 tablespoons of chopped garlic and 2 tablespoons of grated soap can be infused in 1 litre of boiling water, allowed to cool and then used as an insecticide[201]. An excellent glue can be made from the juice[7], when this is spread on glass it enables a person to cut clean holes in the glass[7]. The juice is also used as a glue in mending glass and china[46]. An extract of the plant can be used as a fungicide[18]. It is used in the treatment of blight and mould or fungal diseases of tomatoes and potatoes [201]. If a few cloves of garlic are spread amongst stored fruit, they will act to delay the fruit from rotting[7]. The growing plant is said to repel insects, rabbits and moles[14, 20].

dwatta Anthelmintic Antiasthmatic Anticholesterolemic Antiseptic Antispasmodic Cancer Cholagogue Diaphoretic Diuretic Dysentery Expectorant Febrifuge Hypoglycaemic Stimulant Stings Stomachic Tonic VasodilatorGarlic has a very long folk history of use in a wide range of ailments, particularly ailments such as ringworm, Candida and vaginitis where its fungicidal, antiseptic, tonic and parasiticidal properties have proved of benefit[218]. The plant produces inhibitory effects on gram-negative germs of the typhoidparatyphoid-enteritis group, indeed it possesses outstanding germicidal properties[240] and can keep amoebic dysentery at bay[244]. It is also said to have anticancer activity[218]. It has also been shown that garlic aids detoxification of chronic lead poisoning[244]. Daily use of garlic in the diet has been shown to have a very beneficial effect on the body, especially the blood system and the heart. For example, demographic studies suggest that garlic is responsible for the low incidence of arteriosclerosis in areas of Italy and Spain where consumption of the bulb is heavy[222]. Recent research has also indicated that garlic reduces glucose metabolism in diabetics, slows the development of arteriosclerosis and lowers the risk of further heart attacks in my ocardial infarct patients[238, 254]. Externally, the expressed juice is an excellent antiseptic for treating wounds[244]. The fresh bulb is much more effective medicinally than stored bulbs, extended storage greatly reduces the anti-bacterial action[244]. The bulb is said to be anthelmintic, antiasthmatic, anticholesterolemic, antiseptic, antispasmodic, cholagoque, diaphoretic, diuretic, expectorant, febrifuge, stimulant, stings, stomachic, tonic, vasodilator[4, 9, 14, 21, 46, 165]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Allium sativum for arteriosclerosis, hypertension, high cholesterol levels (see [302] for critics of commission E)

nrakta C. Asia? Original habitat is obscure. An occasional garden escape in Britain[17]. ksacta Not known in a truly wild situation.

propta Plant out the cloves in late autumn for an early summer crop[33, 200]. They can also be planted in late winter to early spring though yields may not be so good. Plant the cloves with their noses just below the soil surface[200]. If the bulbs are left in the ground all year, they will often produce tender young leaves in the winter[K].

nwatta Succeeds in most soils but prefers a sunny position in a moist light well-drained soil[1, 14, 16, 37]. Dislikes very acid soils[206]. Tolerates a pH in the range 4.5 to 8.3. The bulb is liable to rot if grown in a wet soil[27, 52]. Hardy to at least -10°c[206]. The bulbs should be planted fairly deeply[1]. Garlic has a very long history of use as a food and a medicine[244]. It was given to the Egyptian labourers when building the pyramids because it was believed to confer strength and protect from disease, it was also widely used by the Romans[244]. It is widely cultivated in most parts of the world for its edible bulb, which is used mainly as a flavouring in foods. There are a number of named varieties[200]. Bulb formation occurs in response to increasing daylength and temperature[200]. It is also influenced by the temperature at which the cloves were stored prior to planting. Cool storage at temperatures between 0 and 10°c will hasten subsequent bulb formation, storage at above 25°c will delay or prevent bulb formation[200, 206]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.11 Allium neapolitanum

Daffodil Garlic, White garlic

7 tlin 10 cyuc 5 kcak 2 tcan 2 dwat 0.3 m hkuc

htut cyutlı kyuctcup hwicli hrasjlut hpa7tlı flatpriklwis hpa7tmwatlı xre7t hjonlı

drutta Allium neapolitanum is a BULB growing to  $0.3~\mathrm{m}$  (1ft) by  $0.1~\mathrm{m}$  (0ft 4in). See above for USA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf from October to July, in flower from March to May, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves - raw or cooked. Delicious in salads, they start off being sweet and then develop a fairly strong garlic-like flavour, they are liked by most people who try them[K]. The leaves are available from late autumn until early spring and are greatly appreciated at this time of year[K]. Bulb - raw or cooked[2, 105]. Rather small but a very nice mild garlic flavour[K]. Sliced up, they make a delicious addition to salads and can also be used as a vegetable or as a flavouring in cooked foods. They are harvested in mid summer once the plant dies down and will store for 6 months or more[K]. The bulbs are 10 - 20mm in diameter[200]. Flowers - raw or cooked. Excellent in salads, making them look attractive as well as adding a strong onion flavour[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta Europe - Mediterranean area in Europe, Africa and W. Asia ksacta Dry grassy places and fields[45, 90, 203].

propta Seed - sow spring in a greenhouse[200]. The seed can also be sown in a cold frame as soon as it is ripe in early summer. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow on for the first winter in a greenhouse and plant out in late summer whilst the bulbs are dormant. Division in summer once the plant has died down. Very easy, the bulbs divide freely and can be planted straight out into their permanent positions if required.

nwatta An easily grown plant, it prefers a sheltered sunny position in a light well-drained soil[1, 90]. Established plants are reasonably drought tolerant[190]. Plants are said to be rather frost tender[90]. They probably tolerate temperatures down to between -5 and -10°c and can only be grown outdoors in the milder areas of the country[200, K]. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least -5°c[214]. The bulbs should

be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. A very ornamental plant, it is sometimes grown as a decorative indoor plant[1]. There is at least one named variety, 'Grandi-florum' has a richer display of flowers than the type[233]. In sunny weather the flowers develop a sweet scent[245]. Plants come into new growth in late autumn and provide edible leaves throughout most winters[K]. When well-sited, plants can sometimes self-sow to the point of nuisance[190]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.12 Allium paradoxum

Few-Flowered Leek

7 tlin 10 cyuc 5 kcak 0 tcan 2 dwat 0.3 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Allium paradoxum is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf from November to June, in flower from April to May, and the seeds ripen in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in very large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. The rather small bulb is up to 10mm in diameter[200], it has a mild garlic flavour and can be used as a flavouring in salads and cooked foods. It is harvested in early summer when the plant has died down and will store for at least 6 months[K]. Leaves - raw or cooked. A leek substitute[K]. The leaves are available from late autumn until the spring, they are nice in salads when they are young or cooked as a vegetable or flavouring as they get older[K]. The leaves have a milder and more delicate flavour than onions[K]. Flowers - raw. Juicy with a mild garlic flavour, they make a tasty and decorative garnish on salads[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Anticholesterolemic Digestive TonicAlthough no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta W. Asia - Iran. Naturalized in a number of places in Britain[17]. ksacta Hedge banks and waste places on damp soils[17, 90].

propta Seed - best sown as soon as it is ripe in a greenhouse or cold frame. It germinates quickly and can be grown on in the greenhouse for the first year, planting out the dormant bulbs in the late summer of the following year if they have developed sufficiently, otherwise grow on in pots for a further year. Stored seed can be sown in spring in a greenhouse. Bulbils, harvested in mid to late spring, can either be planted immediately or be stored and then planted in late summer. Division in summer after the plants have died down. Very easy, the bulbs divide fairly freely and can be dug up then replanted direct into their permanent positions if remired.

nwatta Prefers a rich moist but well-drained soil[1, 42]. Plants grow well in a heavy wet clay soil in north-west England, where they are self-sowing[203]. Plants are shade tolerant[31], they are easily grown in a cool leafy soil[90] and grow well in light moist woodland[203]. Plants are not very

hardy outside the milder areas of Britain, they tolerate temperatures down to between -5 and -10°c[200]. The bulbs should be planted fairly deeply[1]. There are two forms of this species. The sub-species A. paradoxum paradoxum produces mainly bulbils instead of flowers, this form is naturalized in Britain and can spread quite invasively[K]. The subspecies A. paradoxum normale does not form bulbils. It produces a large umbel of flowers in the spring and is very ornamental at this time. It is not invasive[200, Kl. The seeds have an oil-bearing appendage which is attractive to ants. The ants carry the seed away to eat the oil and then discard the seed, thus aiding dispersal of the plant[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes [18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. The picked flowers can remain fresh for several weeks[89]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.13 Reichardia picroides

French Scorzonera, Common brighteyes 7 tlin 10 cyuc 5 kcak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Reichardia picroides is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from April to August, and the seeds ripen from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves - raw or cooked[2, 27, 37, 52, 105]. Mild and good[37]. A pleasant agreeable flavour with a slight sweetness and very little fibre, it makes a very acceptable lettuce substitute and we use it in large quantities in salads[K]. The older leaves seem to be even nicer, even when the plant is in flower[K]. Root - raw or cooked[2, 177, 183].

nrakta S. Europe. ksacta Cultivated soil and waste places[50]

propta Seed - sow March/April in a warm position outdoors and then in succession if required until the autumn. Only just cover the seed. Germination is usually very good and quick. We usually make a sowing in the spring in the greenhouse, pricking out the seedlings into individual pots as soon as they are large enough to handle, and then planting them out in late spring or early summer. Established plants can self-sow quite freely in disturbed ground.

nwatta Easily grown in any moderately fertile welldrained soil in a sunny position[200]. Grows best in a shady position in summer[37], where it will produce better quality leaves[K]. It prefers plenty of moisture in the growing season[200], though it is fairly drought tolerant once established[K]. Plants are very tolerant of poor soils[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It is likely to be hardier when grown in a soil on the poor soil, though the leaves will not be so tender nor so freely produced[K]. Plants are also likely to be hardier in well-drained soils and dislike very wet weather[K]. Plants are often shortlived, though they are self-sowing quite freely in Cornwall[K]. A very easily grown plant, it has also proved to be almost totally slug-proof, even in a very heavily slug-infested garden[K]. Formerly cultivated as a cut and come again salad crop in S. Europe[27, 37], producing a harvestable yield within 10 weeks of sowing the seed[K]. This plant is possibly useful as a winter salad crop, growing in a sunny fairly sheltered position in Cornwall it has been yielding very well and continuously for a period of 18 months since the summer of 1993[K]. It requires more investigation[K].

#### 8.2.14 Umbellularia californica

California Laurel, California Bay 7 tlin 10 cyuc 4 kcak 0 tcan 2 dwat 25 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik vere winters[1]. The leaves are harvested commercially in hpa7tmwatli xre7t hjonli California and sold as a bay-leaf substitute[183]. The leaves

drutta Umbellularia californica is an evergreen Tree growing to 25 m (82ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower in April, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

pcista The foliage can cause skin irritations[1, 11]. A volatile oil in the leaves can cause sneezing and headaches if inhaled[11]

kcakta Edible Parts: Fruit SeedEdible Uses: Coffee CondimentSeed - cooked[257]. It can be roasted and eaten or can be ground into a powder that is used with cereal flours in making bread[62, 105, 177, 183]. A bitter quality in the seed is dispensed by roasting or parching the seed[92, 161]. Fruit - raw or cooked[257]. The leaves are used as a condiment in cooked foods. They are a bayleaf substitute but with a much stronger flavour[2, 94, 238]. Used for flavouring soups, stew setc[183]. A tea is obtained from the leaves[2]. A coffee substitute is obtained from the root bark[161, 183].

tcanta Dye Essential Incense Repellent WoodThe leaves are used as an insect repellent, they are especially effective against fleas[62, 92, 94, 95, 169]. They have disinfectant properties and contain small quantities of camphor[95, 169]. The leaves are burnt as a fumigant to get rid of fleas[257]. The leaves have been hung in bunches to freshen the air[257]. The aroma of the leaves gives some people headaches[K]. An essential oil is obtained from the leaves by steam distillation[11, 46, 61, 82]. Beige and green dyes are obtained from the fruits (used without the seeds). Very aromatic, the dye retains its fragrance for many years[168]. Wood - hard, close grained, heavy, strong, takes a high polish. A beautifully textured wood, it is used for high quality cabinet making, panelling etcl61, 82, 94, 2291.

dwatta Analgesic Antirheumatic Nervine Poultice Salve Stimulant StomachicCalifornia laurel was employed medicinally by some native North American Indian tribes who used it particularly as an analgesic to treat a variety of complaints[257]. It is still occasionally used in modern herbalism, being valued for its beneficial effect upon the digestive system. The leaves are analgesic, antirheumatic, nervine and stomachic[92, 94, 95, 238, 257]. Although the aroma of the leaves is known to cause headaches, they have also been used as an infusion and a poultice to treat this affliction[92, 94, 95, 238, 257]. The leaves are also used internally to treat neuralgia, intestinal cramps and gastro-enteritis[238]. An infusion has been used by women to ease the pains of afterbirth[257]. Externally, an infusion has been used as a bath in the treatment of rheumatism[257]. A decoction of the leaves has been used as a wash on sores and to remove vermin from the head[257]. They are harvested as required and can be used fresh or dried[238]. A poultice of the ground seeds has been used to treat sores[257]. The seeds have been eaten as a stimulant[257].

nrakta South-western N. America - California to Oregon. ksacta Lower mountain slopes, flatlands, hillsides etc, on various soils and often in shade[62, 94]. The best specimens are found in deep rich soils of valley bottoms[229].

propta Šeed - it has a limited viability and is best sown as soon as it is ripe in the autumn in a greenhouse[200]. Stored seed should be sown as early in the year as possible in the greenhouse. In the wild the seed germinates as soon as it falls to the ground in the autumn[82]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a shaded frame. Pot up in spring. Good percentage[78, 200]. Layering.

nwatta Landscape Uses:Hedge, Aggressive surface roots possible, Screen, Specimen, Street tree, Woodland garden. Requires a well-drained moisture retentive lime-free soil in a sunny position[200]. Prefers an abundant supply of moisture in the growing season[82]. Older plants are hardy to about -15°c when growing in a position that is sheltered from cold drying winds, but young plants require some frost protection[200]. Even mature plants can be damaged in se-

vere winters[1]. The leaves are harvested commercially in California and sold as a bay-leaf substitute[183]. The leaves emit a powerful camphor-like scent when bruised[245]. So strong is the aroma that it can cause headaches and dizziness[245]. A very large and beautiful tree fruited regularly at Kew, producing viable seed, until it was blown down in the severe storms of October 1987[K]. Special Features:Attracts birds, North American native, Fragrant foliage, Inconspicuous flowers or blooms.

#### 8.2.15 Juglans regia

Walnut, English walnut, Persian Walnut,

7 tlin 9 cyuc 4 kcak 4 tcan 3 dwat 20 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Juglans regia is a deciduous Tree growing to 20 m (65ft) by 20 m (65ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in flower in June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil Oil Sap SeedEdible Uses: Oil Oil Sweetener TeaSeed - eaten raw or used in confections, cakes, ice cream etcl. 5, 12, 34, 183]. A delicious flavour. The seed can also be ground into a meal and used as a flavouring in sweet and savoury dishes[183]. The unripe fruits are pickled in vinegar[183]. An edible oil is obtained from the seed[4, 7, 57, 183], it should not be stored for any length of time since it tends to go rancid quickly[7, 132]. The oil has a pleasant flavour and is used in salads or for cooking[183]. The sap is tapped in spring and used to make a sugar[117]. The finely ground shells are used in the stuffing of 'agnolotti' pasta[183]. They have also been used as adulterant of spices[269]. The dried green husks contain 2.5 - 5% ascorbic acid (vitamin C) - this can be extracted and used as a vitamin supplement[269]. The leaves are used as a tea[183].

tcanta Dve Herbicide Miscellany Oil Oil Paint Polish Repellent Tannin Teeth WoodA yellow dye is obtained from the green husks[4, 7, 100, 117]. It is green[148]. The green nuts (is this the same as the green husks?) and the leaves are also used[148]. The rind of unripe fruits is a good source of tannin[158]. A brown dye is obtained from the leaves and mature husks[4, 7, 48, 117, 168]. It does not require a mordant and turns black if prepared in an iron pot[168]. The dye is often used as a colouring and tonic for dark hair[238]. The leaves and the husks can be dried for later use[169]. A golden-brown dye is obtained from the catkins in early summer. It does not require a mordant[168]. A drying oil is obtained from the seed. It is used in soap making, paints, etc. It is not very stable and quickly goes rancid[7, 21, 34, 46]. The nuts can be used as a wood polish. Simply crack open the shell and rub the kernel into the wood to release the oils. Wipe off with a clean cloth[4, 6, K]. The dried fruit rind is used to paint doors, window frames etc[145] (it probably protects the wood due to its tannin content). The shells may be used as anti-skid agents for tyres, blasting grit, and in the preparation of activated carbon[269]. The leaves contain juglone, this has been shown to have pesticidal and herbicidal properties[218]. The crushed leaves are an insect repellent[46, 61]. Juglone is also secreted from the roots of the tree, it has an inhibitory effect on the growth of many other plants[201]. Bark of the tree and the fruit rind are dried and used as a tooth cleaner. They can also be used fresh[145, 158]. Wood - heavy, hard, durable, close grained, seasons and polishes well. A very valuable timber tree, it is used for furniture making, veneer etc[1, 4, 7, 46, 61, 158]. A dynamic accumulator gathering minerals or nutrients from the soil and storing them in a more bioavailable form - used as fertilizer or to improve mulch.

dwatta Alterative Anodyne Antiinflammatory Astringent Bach Blood purifier Cancer Depurative Detergent Diuretic Eczema Laxative Lithontripic Miscellany Pectoral Skin Stimulant Urinary Vermifuge Vitamin CThe walnut tree has a long history of medicinal use, being used in folk medicine to treat a wide range of complaints [269]. The leaves are alter-

pcista The leaves contain oxalic acid, which gives them their sharp flavour. Perfectly all right in small quantities, the leaves should not be eaten in large amounts since oxalic acid can bind up the body's supply of calcium leading to nutritional deficiency. The quantity of oxalic acid will be reduced if the leaves are cooked. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can agaravate their condition[238].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves - raw or cooked[105]. A pleasant acid flavour, though a little fibrous[K]. Use in moderation, see notes at top of sheet, Flowers - raw[K]. A dellightful acid flavour, they make an attractive addition to the salad bowl and are especially relished by children[K]. Root - cooked. Starchy but of poor quality[2, 105].

tcanta Ground cover[K]. The plants are dormant for about 5 months of the year, but grow so densly in the summer that they make an effective ground cover in full sun or light shade[K].

nrakta Southern N. America - Mexico. Naturalized in Britain. ksacta A weed of cultivated soil in Jersey[17].

propta Seed - best sown as soon as it is ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta A very easily grown plant, preferring a sandy soil in a warm dry position[1]. Our plants have proved to be very tolerant of neglect, succeeding for a number of years even in the dense growth of grass weeds[K]. When well-tended, clumps can spread quite quickly[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Closely related to O. deppei, which is included in this species by many botanists[200].

#### 8.2.152 Allium akaka

7tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium akaka is a BULB growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[46, 61, 105, 177]. Used as an onion substitute[22]. The whole of the young plant is said to be a great delicacy and is used as an addition to rice in a pilau[2, 183]. The bulb is 15 - 30mm wide[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe growing plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta W. Asia - Turkey, N. Iran, Russia. ksacta Dry stony places, screes etc, 1600 metres to 3000 metres[74, 90]. propta Seed - sow spring in a cold frame. Prick out the seedlings into individual nots when they are large enough to

seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for

at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained dry to moist soil[1]. Bulbs are not hardy in all parts of Britain, they probably tolerate temperatures down to between -5 and -10°c but because of their need for a very well-drained dry to moist soil are probably best grown in a bulb frame[90]. The plants need a dry period in late summer when they are dormant in order to fully ripen the bulb[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. This species is a cultivated crop in Iran[105], where it is sold in the bazaars of Teheran[183]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.153 Fraxinus floribunda

Himalayan Ash

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 40 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Fraxinus floribunda is a deciduous Tree growing to 40 m (131ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: MannaEdible Uses: A manna is obtained by incision of the trunk[61, 177]. It is used as a sweetener but is laxative if used in quantity[61, 23].

tcanta WoodWood. Used for oars, ploughs and poles[51, 272]

dwatta Abortifacient LaxativeThe manna obtained from incisions in the stem is a safe and gentle laxative[61, 240, 243]. The young shoots are abortifacient[272].

nrakta E. Asia - Himalayas from Himachel Pradesh to S.W. China. ksacta Rich moist soils in forests, 1200 - 2700 metres in the Himalayas[51, 146]. Dense forests, mixed woods of valleys, roadsides; sea level to 2600 metres in western China[266].

propta The seed is best harvested green - as soon as it is fully developed but before it has fully dried on the tree - and can then be sown immediately in a cold frame[80]. It usually germinates in the spring[80]. Stored seed requires a period of cold stratification and is best sown as soon as possible in a cold frame[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out into their permanent positions or a nursery bed in late spring or early summer of the following year. If you have sufficient seed then it is possible to sow it directly into an outdoor seedbed, preferably in the autumn. Grow the seedlings on in the seedbed for 2 years before transplanting either to their permanent positions or to nursery beds.

mwatta Prefers a deep loamy soil, even if it is on the heavy side[1, 200]. Most members of this genus are gross feeders and require a rich soil[11, 200]. Plants succeed when growing in exposed positions[200] and also in alkaline soils[11]. Plants tolerate atmospheric pollution[200]. Closely related to F. ornus[200]. This species is not very hardy in Britain but can succeed outdoors in the milder areas[1]. It has a very wide range in the wild and there are probably provenances that will do much better in Britain[11]. Dioecious. Male and female plants must be grown if seed is required.

riander[18, 20, 201].

# 8.2.53 Myrteola nummularia

Cranberry-myrtle,

7 tlin 10 cyuc 4 kcak 3 tcan 0 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Myrteola nummularia is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen from November to December. The species is hermaphrodite (has both male and female organs) and is polinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit LeavesEdible Uses: TeaFruit raw or cooked. A sweet and agreeable flavour[2, 105]. The fruit is up to 1cm in diameter, it has a soft juicy flesh and a delicious slightly aromatic flavour[K]. It is produced in late autumn and early winter, and is a very valuable fruit at this time of the year[K]. The leaves are a tea substitute[177].

tcanta Suitable for ground cover when spaced about 45cm apart each way, the plants form a carpet of low branches that root as they spread[208]. Plants are a bit slow to become established and will need weeding for their first few years after planting[K].

nrakta S. America - S. Chile, Falklands. ksacta Raised parts of bogs, especially with sphagnum[69].

propta Pre-soak the seed for 24 hours in warm water and then sow it in late winter in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Pot up in the autumn and overwinter in a cold frame. Plant out in late spring. High percentage[78]. Cuttings of mature wood of the current seasons growth, 7 - 12cm with a heel, November in a shaded and frost free frame. Plant out in late spring or early autumn. High percentage[78]. Lavering.

nwatta Succeeds in any reasonably good soil[1] including dry ones. Prefers a moderately fertile well-drained loam in a sunny position[11, 200]. Prefers a cool position according to another report. Tolerates maritime exposure[182]. This species is not very hardy when grown outdoors in Britain, succeeding to the south and west of London[11]. A group of plants in a sunny position on a rock garden at Kew Gardens seem to be perfectly happy and hardy, producing a reasonable crop of fruit in December 1996[K]. A good carpeting plant for moist stones etc in a rockery[11]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.54 Ouercus lamellosa

Bull Oa

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 35 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus lamellosa is an evergreen Tree growing to 35 m (114ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - cooked. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed of this species is particularly large with four of them covering an adult hand[258]. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be

lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute

tcanta Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is a source of tannin[146]. Wood - very hard, durable if it is not wet. Used for construction, making the handles of agricultural implements etc[146, 272]. An excellent fuel[146].

dwatta Astringent DysenteryThe bark and acorns are astringent[240]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta E. Asia - Himalayas. ksacta Forms dense evergreen forests with Lithocarpus and Castanopsis species at altitudes up to 2700 metres [146, 258].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. A very ornamental tree[1], it is somewhat tender in Britain but grows well on the Isle of Wight and in Cornwall[1]. It prefers warmer sumers than are usually experienced in Britain[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

# 8.2.55 Eucalyptus gunnii

Cider Gum

7 tlin 10 cyuc 3 kcak 3 tcan 3 dwat 30 m hkuc

htut cyutli hgatkyuctcuphja7n hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Eucalyptus gunnii is an evergreen Tree growing to 30 m (98ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista Citronellal, an essential oil found in most Eucalyptus species is reported to be mutagenic when used in isolation[269]. In large doses, oil of eucalyptus, like so many essential oils has caused fatalities from intestinal irritation[269]. Death is reported from ingestion of 4 · 24 ml of essential oils, but recoveries are also reported for the same amount[269]. Symptoms include gastroenteric burning and irritation, nausea, vomiting, diarrhoea, oxygen deficiency, weakness, dizziness, stupor, difficult respiration, delirium, paralysis, convulsions, and death, usually due to respiratory failure[269].

kcakta Edible Parts: Manna SapEdible Uses: The sap[2, 77] (it is a stem exudate according to some reports[61, 177])

has a sweet taste. The sap is obtained by making wounds in the bark during spring[2]. A tapped trunk yields up to ½ litre a day[144]. Another report says that the sap exudes from the trunk and can be drunk directly or fermented into a cider[183]. This same report says that the plant also produces an edible manna[183].

tcanta Essential Fuel Fungicide RepellentLeaves yield between 0.4 to 0.8% of an essential oil that contains antifungal substances[152, 154]. Coppiced for fuel. The wood must be dried for at least 12 months before use[107]. Trees can be planted in wet ground to dry it up and make it unsuitable for mosquitoes to breed in[50].

dwatta AntisepticEucalyptus leaves are a traditional Aboriginal herbal remedy. The essential oil found in the leaves is a powerful antiseptic and is used all over the world for relieving coughs and colds, sore throats and other infections[254]. The essential oil is a common ingredient in many over-the-counter cold remedies[254]. An essential oil obtained from the leaves is antiseptic[152]. The essential oil obtained from various species of eucalyptus is a very powerful antiseptic, especially when it is old, because ozone is formed in it on exposure to air. It has a decided disinfectant action, destroying the lower forms of life[4]. The oil can be used externally, applied to cuts, skin infections etc, it can also be inhaled for treating blocked nasal passages, it can be gargled for sore throat and can also be taken internally for a wide range of complaints[4]. Some caution is advised, however, because like all essential oils, it can have a deleterious effect on the body in larger doses[4].

nrakta Australia - South Australia, Tasmania. ksacta Alpine areas on rocky well-drained soils, sometimes also found on marshy soils[77].

propta Seed - surface sow February/March in a sunny position in a greenhouse[11, 78, 134]. Species that come from high altitudes appreciate 6 - 8 weeks cold stratification at 2°c[200]. Pot up the seedlings into individual pots as soon as the second set of seed leaves has developed, if left longer than this they might not move well. Plant out into their permanent positions in early summer and give them some protection from the cold in their first winter. The seed can also be sown in June, the young trees being planted in their final positions in late spring of the following year. The seed has a long viability[2001.

nwatta Prefers a sunny position in a moderately fertile well-drained moisture retentive circum-neutral soil[200]. Dislikes clay or chalk soils but succeeds in most other soils[98]. Tolerates poor soils[98], especially those low in mineral elements[200]. Dislikes shade[98]. Tolerates dry soils and also drought once it is established[200]. One of the hardiest Eucalyptus species[11], it is very frost resistant, tolerating long periods down to -14°c and short periods down to -18°c[107, 200]. Eucalyptus species have not adopted a deciduous habit and continue to grow until it is too cold for them to do so. This makes them more susceptible to damage from sudden cold snaps. If temperature fluctuations are more gradual, as in a woodland for example, the plants have the opportunity to stop growing and become dormant, thus making them more cold resistant [200]. A deep mulch around the roots to prevent the soil from freezing also helps the trees to survive cold conditions. The members of this genus are remarkably adaptable however, there can be a dramatic increase in the hardiness of subsequent generations from the seed of survivors growing in temperate zones[200]. A very ornamental tree, it is very fast growing when young and reguires shelter from strong winds if it is not to become very wind-shaped[K]. Trees can tolerate salt-laden winds[200]. The plant has juvenile foliage which is quite different from the adult leaves[188]. The leaves, especially when bruised, are very aromatic[245]. Plants respond well to coppicing. Commonly planted in S.W. Europe as a timber tree and also for shelter, soil conservation and as an anti-malarial measure since it will dry out wet land that is suitable for mosquitoes to breed in [50]. Plants are shallow-rooting and, especially in windy areas, should be planted out into their permanent positions when small to ensure that they do not suffer from windrock[245]. They strongly resent root disturbance and should be container grown before planting out into their permanent position[11]. Eucalyptus monocultures are an environmental disaster, they are voracious, allelopathic and encourage the worst possible attitudes to land use and conservation[200]. The flowers are rich in nectar and are a good bee crop[200] The plant is heat tolerant in zones 10 through 8. (Plant Hardi-

ness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2].

#### 8.2.56 Eucalyptus viminalis

Manna Gum

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 30 m hkuc htut cyutli hgatkyuctcuphja7n hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eucalyptus viminalis is an evergreen Tree growing to 30 m (98ft) by 15 m (49ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry moist or wet soil and can tolerate drought.

pcista Citronellal, an essential oil found in most Eucalyptus species is reported to be mutagenic when used in isolation[269]. In large doses, oil of eucalyptus, like so many essential oils has caused fatalities from intestinal irritation[269]. Death is reported from ingestion of 4 · 24 ml of essential oils, but recoveries are also reported for the same amount[269]. Symptoms include gastroenteric burning and irritation, nausea, vomiting, diarrhoea, oxygen deficiency, weakness, dizziness, stupor, difficult respiration, delirium, paralysis, convulsions, and death, usually due to respiratory failure[269].

kcakta Edible Parts: MannaEdible Uses: A manna is exuded from the leaves[4, 11, 177] (from the bark as well according to some reports[61, 177]) as a result of insect damage[144]. The red gum or manna exuding from cracks in the bark is eaten eagerly by boys[269]. Eucalyptus manna, which exudes from punctures in summer months, is sometimes consumed[269]. A very pleasant sweet taste[46, 105], it is slightly laxtive[152]. The aboriginal Australians collected it after it fell to the ground, or they scraped it from the leaves[183]. Heavily covered leaves were pounded and baked[183]. Since the manna is probably formed as a result of insect damage, it is quite possible that it will not be formed in Britain because the same insects will not be able to live here[K]. The manna contains the sugars arabinose, raffinose, dextrose, and sucrose[269].

tcanta Adhesive Essential Fuel Repellent Soil stabilization WoodThe leaves contain between 0.35 - 0.75% essential oil, of which 50 - 65% is cineol, 5% is pinene, and 10% is eudesmol[154, 269]. The bark contains 4.8 - 8% tannin[269]. The red gum or manna exuding from cracks in the bark has been used for making adhesives[269]. Planted in S. Europe for soil stabilization and to drain marshes in order to get rid of malarial mosquitoes[50]. Wood - coarse grained, durable in the soil[46, 61], excellent quality[77]. In rich soils the wood is not so hard or durable[155]. The wood, which weighs about 51 lb,/cu ft, is used for building, construction, joinery, and vehicles[269]. It is considered suitable for paper pulp[269] and is a moderately good fuel[155].

dwatta Antiviral LaxativeA sweet manna exuded from the plant has a mild laxative effect[152, 238]. The essential oil found in the leaves shows an antiviral effect and can be used in the treatment of influenza[269]. The leaves inhibit the growth of Staphylococcus aureus[269]. The leafy twig decoction was used to bathe rheumatic limbs[269].

nrakta Australia - Tasmania. ksacta Cool moist sites, usually on better soils, to 1400 metres[77, 152].

propta Seed - surface sow February/March in a sunny position in a greenhouse[11, 78, 134]. Species that come

hardy in the colder areas of the country, it tolerates temperatures down to about -10°c[200]. Sometimes cultivated as a culinary herb. A good companion plant, improving the flavour of nearby plants[18, 20]. The flowers are very attractive to bees[108]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.148 Muehlenbeckia axillaris

Sprawling wirevine

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Muehlenbeckia axillaris is a deciduous Climber growing to 0.3 m (1ft) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Sweet and juicy[173]. The fruit is very small, only 3mm in diameter[200].

tcanta A fast growing ground cover plant for a sunny position but it requires weeding for the first year or so[197, 208]. Once established, it can swamp out small plants[197].

nrakta Australia to New Zealand. ksacta Gravelly and rocky places and open grassland southwards from 38° south in North and South Islands of New Zealand[44]. Scrub and river flats to the sub-alpine zone[173].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8 cm with a heel, pluly/August in a frame. Pot up in autumn and overwinter in a cold frame. High percentage[78]. Plant out in late spring. Cuttings of mature wood of the current season's growth, 5 - 10cm with a heel, October/November in a cold frame. High percentage[78]. Division in sprind[200].

nwatta Requires a well-drained soil in sun or semishade[200]. Plants are not hardy outside the milder areas of Britain, but given a position sheltered from cold drying winds they tolerate temperatures down to about -15°c[200]. A climbing plant that supports itself by twining around other plants etc[219]. Plants can become invasive, spreading by means of underground shoots[208]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.149 Oxalis articulata

Pink Sorrel

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 0.2 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hionli

drutta Oxalis articulata is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

pcista The leaves contain oxalic acid, which gives them their sharp flavour. Perfectly all right in small quantities, the leaves should not be eaten in large amounts since oxalic acid can bind up the body's supply of calcium leading to nutritional deficiency. The quantity of oxalic acid will be reduced if the leaves are cooked. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Flowers LeavesEdible Uses: Leaves and flowers - raw or cooked. A pleasant lemony flavour, they make a nice flavouring in salads[K]. The leaves

are available from June to October and the flowers from July to October, or even later in mild autumns[K]. Use in moderation, see notes at top of sheet.

nrakta Southern S. America - Paraguay. ksacta Not

propta Seed - best sown as soon as ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Our plants have never produced seed. Division in spring. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta An easily grown plant, preferring a sandy soil in a warm dry position[1, 27, 37]. It dislikes dry or heavy soils[37]. Dislikes lime[37]. Prefers a southerly aspect[37]. This species is only hardy outdoors in the milder areas of Britain, tolerating temperatures down to about -5°c or perhaps a bit lower if the soil is very well-drained[200]. This plant can become a weed in areas suitable for its growth[200], though the British climate is generally too cool for this to happen[K].

# 8.2.150 Atriplex californica

California Orach, California saltbush 7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 0.1 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli hjonli

drutta Atriplex californica is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista No member of this genus contains any toxins, all have more or less edible leaves. However, if grown with artificial fertilizers, they may concentrate harmful amounts of nitrates in their leaves.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves - cooked. Seed - cooked. Used as a piñole[103, 105, 161, 177]. The seeds are 1 - 2mm in diameter[270].

nrakta South-western N. America - California. ksacta Sea bluffs, sandy coasts, crevices in sea cliffs, coastal strands, edges of coastal salt marsh, coastal sage scrub from sea level to 50 metres/2701.

propta Seed - sow April/May in a cold frame. Germination usually takes place within 1 - 3 weeks at 13°c. As soon as they are large enough to handle, prick the seedlings out into individual pots and plant them out into their permanent positions in the summer[134].

nwatta Succeeds in full sun in any well-drained but not too fertile soil[200]. Most species in this genus tolerate saline and very alkaline soils[200]. Succeeds in a hot dry position. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200].

#### 8.2.151 Oxalis tetraphylla

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Oxalis tetraphylla is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta Western N. America - Oregon to California. ksacta Meadows and aspen groves, occasionally on open slopes[60]

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. This species is only hardy in the milder areas of the country, it should tolerate temperatures down to between -5 and -10°c[200]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.146 Allium roseum

Rosy Garli

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.4 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli

drutta Allium roseum is a BULB growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible [76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[2, 105, 177]. A garlic substitute, it is used as a flavouring in salads and cooked foods[22]. The bulbs are 10 - 15mm in diameter[200]. Leaves - raw or cooked. A mild garlic flavour, they make a nice addition to salads and can also be used as a flavouring in cooked foods[K]. Flowers - raw. Used as a garnish on salads, they are very attractive and have a pleasant mild garlic flavour[K]. Bulbils - raw or cooked. Very small and fiddly to use, though they have a pleasant mild garlic flavour[K].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta Europe - Mediterranean. Naturalized in Britain[17]. ksacta Grassland and gravelly places near the sea[45].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. Very easy, the plants divide successfully at any time in the grow-

ing season and the divisions can be planted straight out into their permanent positions if required.

nwatta Easily grown in a warm sunny position in a light well-drained soil[1, 90, 203]. Only hardy in the milder parts of Britain, it tolerates temperatures down to between -5 and -10°c[200]. The bulbs should be planted fairly deeply[1]. A very ornamental plant[1]. There are several named forms[203]. The sub-species A. roseum bulbiferum produces a few sterile flowers and many bulbils on its flowering stem[203]. This form will probably spread freely and perhaps escape from cultivation[K]. The sub-species A. roseum roseum does not produce bulbils[203]. Both forms produce numerous bulblets around the base of the main bulb[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes [18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.147 Origanum onites

Pot Marioram

7 tlin 10 cyuc 3 kcak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Origanum onites is a PERENNIAL growing to 0.3 m (1ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaLeaves-raw or cooked. They are used as a flavouring for salad dressings, vegetables and legumes and are best added in the final stages of cooking[183, 238]. A strong thymelike aroma, the leaves are used as a substitute for oregano r marjoram, but they are inferior in flavour[183, 238]. A slightly bitter flavour, it is not nearly so sweet and delicate as O. majorana or O. vulgare[244]. Its flavour, however, lasts longer in cooked dishes[244]. A herb tea is made from the leaves[183].

tcanta Disinfectant Dye Essential Pot-pourriAn essential oil from the leaves is used as a food flavouring and in perfumery[57, 61, 171]. The leaves and flowering stems are added to pot-pourri and scented articles[238]. The plant is often used to disinfect bee hives[7].

dwatta Antiseptic Antispasmodic Carminative Cholagogue Diaphoretic Disinfectant Emmenagogue Expectorant Stimulant Stomachic TonicThe leaves and flowering stems are antiseptic, antispasmodic, carminative, cholagogue, diaphoretic, emmenagogue, expectorant, stimulant, stomachic and mildly tonic[4, 21]. They are harvested in the summer and can be used fresh or dried[238].

nrakta Europe - Mediterranean ksacta Stony hills and rocky slopes, usually on limestone, occasionally in partial shade, to 1400 metres in Turkey[93].

propta Seed - sow early spring at 10 - 13°c and only just cover the seed. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late spring. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to not up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in June. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 -10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a rather dry, warm, well-drained soil, but is not fussy as to soil type[1, 18], thriving on chalk[1]. Prefers slightly alkaline conditions[200]. This species is not

from high altitudes appreciate 6 - 8 weeks cold stratification at  $2^{\circ}c[200].$  Pot up the seedlings into individual pots as soon as the second set of seed leaves has developed, if left longer than this they might not move well. Plant out into their permanent positions in early summer and give them some protection from the cold in their first winter. The seed can also be sown in June, the young trees being planted in their final positions in late spring of the following year. The seed has a long viability[200].

nwatta Prefers a sunny position in a moderately fertile well-drained moisture retentive circum-neutral soil[200]. Tolerates poor soils, especially those low in mineral elements[200]. Tolerates dry soils and also drought once it is established[200]. A fairly hardy species, one report suggests that it is hardy to between -15°c and -20°c[200] whilst another says that plants succumb to hard frosts[11]. Eucalyptus species have not adopted a deciduous habit and continue to grow until it is too cold for them to do so. This makes them more susceptible to damage from sudden cold snaps. If temperature fluctuations are more gradual, as in a woodland for example, the plants have the opportunity to stop growing and become dormant, thus making them more cold resistant. A deep mulch around the roots to prevent the soil from freezing also helps the trees to survive cold conditions. The members of this genus are remarkably adaptable however, there can be a dramatic increase in the hardiness of subsequent generations from the seed of survivors growing in temperate zones[200]. Eucalyptus monocultures are an environmental disaster, they are voracious, allelopathic and encourage the worst possible attitudes to land use and conservation[200]. A fast growing tree, it is often cultivated in S.W. Europe for timber, soil stabilization shelter and as an anti-malarial measure, the trees are capable of drying out wet ground, making it unsuitable for mosquitoes to breed in[50]. This species is very easily confused with E. dalrympleana[11]. Plants are shallow-rooting and, especially in windy areas, should be planted out into their permanent positions when small to ensure that they do not suffer from windrock[245]. They strongly resent root disturbance and should be container grown before planting out into their permanent position[11]. The flowers are rich in nectar and are a good bee crop[200].

#### 8.2.57 Juniperus deppeana

Alligator Juniper

7 tlin 9 cyuc 3 kcak 0 tcan 0 dwat 18 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatprikl-

wisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus deppeana is an evergreen Tree growing to 18 m (59ft lin) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to March, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[85, 161, 183]. A dry and mealy texture[82, 181] but with a sweet and palatable taste[2, 181]. The fruit can also be dried, ground into a meal and prepared as a mush or cakes[95, 105, 183]. The fruit has a sweetish palatable pulp and is about 15mm in diameter[183]. The cones take 2 years to mature[200].

tcanta WoodWood - light, soft, not strong, brittle, close grained[82]. Although easily worked, it is of limited value as lumber and is used mainly for fence posts and fuel[229].

nrakta South-western N. America - Texas, Arizona and Mexico. ksacta Open oak or pine woodlands[229] on dry, arid mountain sloves. 1200 - 1800 metres[82].

propta The seed requires a period of cold stratification.
The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown

as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Screen, Specimen. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[11]. Requires a hot dry position in full sun[200]. Does well on lime[200]. A slow-growing but long-lived tree[229], it grows better in dry areas with hot summers[200]. Western Britain is generally to cool and wet for this species to thrive[200]. Trees often produce vigorous shoots from the base of the trunk, or from the stumps of felled trees[82]. The seed takes two summers to ripen[229]. Dioecious. Male and female plants must be grown if seed is required. Special Features: North American native, Fragrant foliage, Inconspicuous flowers or blooms.

#### 8.2.58 Cordyline australis

Cabbage Tree

7 tlin 10 cyuc 3 kcak 3 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Cordyline australis is an evergreen Tree growing to  $15 \, \mathrm{m}$  (49ft) by  $5 \, \mathrm{m}$  (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Leaves Root StemEdible Uses: SweetenerRoot - baked[105, 153, 173, 177]. It can also be brewed into an intoxicating drink[183]. Pith of the trunk - dried and steamed until soft[173]. Sweet and starchy, it is used to make porridge or a sweet drink[173]. The root and stems are rich in fructose, the yields compare favourably with sugar beet (Beta vulgaris altissima)[153]. Edible shoots - a cabbage substitute[105, 128, 173]. The leaves are very fibrous even when young, we would not fancy eating them[K].

tcanta Fibre PaperThe leaves contain saponins, but not in commercial quantities[153]. The leaves contain a strong fibre, used for making paper, twine, cloth, baskets, thatching, rain capes etc[1, 46, 61, 128, 153]. The whole leaves would be used for some of these applications. When used for making paper, the leaves are harvested in summer, they are scraped to remove the outer skin and are then soaked in water for 24 hours prior to cooking[189]. Carbon farming Industrial Crop: fiber.

nrakta New Zealand. ksacta Forest margins and open places. Abundant near swamps. North, South and Stewart Islands[44].

propta Seed - pre-soak for about 10 minutes in warm water and sow in late winter to early spring in a warm greenhouse[78, 164]. The seed usually germinates in 1 - 3 months at 25°c[164]. There is usually a good percentage germination[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring after the last expected frosts and give the plants some protection in their first winter outdoors[K]. Stem cuttings cut off the main stem just below the head and then saw off 5cm thick blocks of stem and place them 3cm deep in pure peat in a heated frame. Keep them moist until they are rooting well, then pot them up into individual pots. Plant out in late spring after the last expected frosts. Suckers, These are best removed in early spring and planted out in situ. Protect the division from wind and cold weather and do not allow the soil to become dry until the plant is established. Divisions can also be potted up and grown on until established, planting them out in the summer.

nwatta Industrial Crop: Fiber Management: Standard Minor Global CropPrefers a good sandy loam rich in humus[1]. Succeeds in full sun or light shade[188]. A very wind hardy plant, tolerating maritime exposure[49, 166]. A very ornamental plant[1], it is not very cold-hardy, tolerating short-lived lows down to about -10°c[260]. It only succeeds outdoors in the milder areas of Britain[1, 11, 59]. It grows very well in Cornwall where it often self-sows[1, 11, 59]. A form with purplish leaves is hardier than the type and succeeds outdoors in Gloucestershire[11]. The flowers have a delicious sweet scent that pervades the air to a considerable distance[245]. Mice often kill young plants by eating out the pith of the stem[11]. Carbon Farming Cultivation: minor global crop. Management: standard.

#### 8.2.59 Prumnopitys andina

Plum-Fruited Yew

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 15 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Prumnopitys andina is an evergreen Tree growing to 15 m (49ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[105, 139, 177]. Aromatic with a taste like the sweetwater grape[11, 245]. The fruit is up to 20mm long and 15mm wide, it contains one seed[200]. Seed[11, 81]. No more details are given.

tcanta Hedge Hedge WoodThe plant is very tolerant of trimming and can be grown as a hedge[1, 29, 200]. Wood. Used to make furniture[139].

nrakta S. America - S. Chile. ksacta Humid woods between the coast and the hills[139], between latitudes 36 and  $40^{\circ}$ south[11].

and spropta Seed - it can be sown at any time of the year in a sandy soil in a greenhouse[1]. It can take 18 months to germinate[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/august in a frame. Easy[1]. Cuttings of ripe wood with a heel in late summer.

nwatta Thrives in any good soil, including chalk[11, 81]. Requires a sheltered position[11]. A very ornamental plant[1], but it is in general very slow growing in Britain[11, 81], though slightly faster in the south-west[185]. Plants are usually dioecious though monoecious forms are known. Male and female plants must be grown if seed and fruit are required. The fruits are fragrant[245].

# 8.2.60 Jubaea chilensis

Chilean Wine Palm, Chile cocopalm 7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 12 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Jubaea chilensis is an evergreen Tree growing to  $2\,\mathrm{m}$  (39ft) by  $5\,\mathrm{m}$  (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Fruit Oil Sap SeedEdible Uses: Oil-Sap - raw or cooked. A very sweet taste, it can be used as a refreshing drink[1, 2, 11, 61], concentrated into a syrup of fermented into a wine[183]. The tree is felled and the crown removed, the sap then begins to flow and, providing a thin

section of trunk is removed daily, the sap will continue to flow for several months[2]. Yields of over 400 litres of sap can be obtained from a tree[2]. Fruit - candied and used as a sweetmeat[61, 183]. The fruit is about 5cm in diameter[200]. Seed -raw or cooked[46, 61]. A pleasant nutty flavour raw[2], they are also used in sweetmeats[183]. The seed is about 5cm in diameter[231]. An edible oil is obtained from the seed[46, 61, 105, 177].

tcanta Basketry Brush Oil Paper Stuffing ThatchingThe leaves are used to make baskets, brushes and for thatching[46, 61, 139]. Fibres from the plant are used as a stuffing material for mattresses etc[139]. A paper is made from the fibres in the trunk[139].

nrakta S. America - Chile. ksacta Usually found between the coast and the hills to 300 metres, between latitudes 31 to  $35^{\circ}$ south[139].

propta Seed - best sown as soon as it is ripe in a warm greenhouse. The seed can take 6 months to germinate[200]. Stored seed should be soaked for 12 - 24 hours in warm water as soon as it is received and then sown in a warm greenhouse. It can be very slow to germinate. The seed has a short viability. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts, and give them some protection from the cold for their first few winters outdoors.

nwatta Management: Standard Regional Crop Staple Crop: OilWe have no records of the cultivation needs of this plant in Britain. It is said in many books that it is not hardy in Britain but some trees have been growing outdoors in Britain at Torquay since 1900 and they were 7.5 metres tall in 1972[11, 166]. It will probably require a sunny sheltered position in a moist but well-drained soil[231]. Some reports say that it can tolerate several degrees of short-lived frost[200, 260]. Palms usually have deep penetrating root systems and generally establish best when planted out at a young stage. However, older plants are substantially more cold tolerant than juvenile plants[231]. In areas at the limit of their cold tolerance, therefore, it is prudent to grow the plants in containers for some years, giving them winter protection, and only planting them into their permanent positions when sheer size dictates [231]. Palms can also be transplanted even when very large. Although the thick fleshy roots are easily damaged and/or desiccated, new roots are generally freely produced. It is important to stake the plant very firmly to prevent rock, and also to give it plenty of water until re-established - removing many of the leaves can also help[231]. This species is sometimes cultivated for its edible fruit and seed plus its many other uses[139]. It is a very slowgrowing plant that takes several years before it begins to form a trunk and takes up to 60 years to produce seed[139]. The tree is becoming very rare in its native range because it has been widely exploited for its edible sap. The trees are beheaded and a large quantity of sap exudes from the trunk. Unfortunately, the tree cannot produce side branches and so it dies after this treatment[139].

#### 8.2.61 Camellia japonica

Camellia, Common Camellia, Japanese Camellia 7 tlin 9 cyuc 3 kcak 2 tcan 2 dwat 10 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia japonica is an evergreen Shrub growing to  $10\ m$  (32ft) by  $8\ m$  (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Oil OilEdible Uses: Oil Oil TeaAn edible oil is obtained from the seed[11, 61, 105]. It is called 'tsubaki oil'[183]. Dried flowers - cooked[105]. Used as a vegetable or mixed with gelatinous-rice to make a Japanese food called 'mochi' [183]. The leaves are a tea substitute[142, 177, 178, 183].

for breast tumours[269]. A salve derived from the flowers is said to help skin cancer[269].

nrakta Derived in cultivation. ksacta Not known in the

propta Seed - sow in situ from early spring to late summer. The first sowing can be made under cloches in late winter and will be ready for use in early summer. The latest sowings for winter use can be made in mid to late summer.

nwatta Turnip is basically a cool climate crop that is resistant to frost and mild freezes[269]. The plants are very easily grown, provided they grow quickly when young and the soil is not allowed to dry out[264]. They succeed in full sun in a well-drained fertile preferably alkaline soil[200]. Turnips grow best in deep, friable, highly fertile soil with pH 5.5 - 6.8[269]. They are said to prefer a light sandy soil, especially when grown for an early crop in the spring, and dislike a heavy soil[37, 269]. They prefer cool moist growing conditions[16]. Turnips tolerate an annual precipitation of 35 to 410cm, an annual average temperature range of 3.6 to 27.4°C and a pH in the range of 4.2 to 7.8[269]. Temperatures below 10°C cause the plants to run to seed, even if they have not yet formed an edible root[269]. The turnip is often cultivated, both in the garden and commercially, for its edible root. A fast growing plant, it can take less than ten weeks from sowing to harvesting[264]. Its short growing season makes turnips very adaptable as a catch crop[269]. There are several named varieties and by careful selection and successional sowing it is possible to harvest roots all year round. The roots are fairly cold hardy and can be left in the ground during the winter, harvesting them as required. However, they can be troubled by slugs and other creatures so it is often better to harvest them in late autumn or early winter and store them in a cool but frost-free place. This species has long been cultivated as an edible plant and a large number of forms have been developed. Botanists have divided these forms into a number of groups, and these are detailed below. Separate entries in the database have been made for each group. B. rapa. The species was actually named for the cultivated garden turnip with its edible swollen tap root. This form is dealt with on this record. B. rapa campestris. This is the wild form of the species. It does not have a swollen root and is closest to the forms grown for their oil-rich seeds. B. rapa chinensis. Pak choi has long been cultivated in the Orient for its large tender edible leaves which are mainly produced in the summer and autumn. B. rapa dichotoma. Cultivated in the Orient mainly for its oil-rich seeds. B. rapa narinosa. Chinese savoy is another Oriental form. It is grown for its edible leaves. B. rapa nipposinica. Mizuna is a fastgrowing cold-hardy form with tender edible leaves that can be produced all year round. B. rapa oleifera. The stubble turnip has a swollen edible root, though it is considered too coarse for human consumption and is grown mainly for fodder and as a green manure. It is also cultivated for its oil-rich seeds. B. rapa parachinensis. False pak choi is very similar to B. rapa chinensis with tender edible leaves, though it is considerably more cold-hardy. B. rapa pekinensis. Chinese cabbages are widely grown in the Orient. The large tender leaves often form a cabbage-like head. B. rapa perviridis. Spinach mustard is grown for its edible leaves. A very cold-hardy plant, and also able to withstand summer heat, it can provide a crop all year round. B. rapa trilocularis. Indian colza is mainly grown for its oil-rich seeds. Grows well with peas but dislikes growing with hedge mustard and knotweed[18, 20]. A good bee plant[108].

# 8.2.144 Allium validum

Swamp Onion, Pacific onion 7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcuphja7n hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Allium validum is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poison-

ing caused by the consumption, in very large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible [76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[257]. The bulb is somewhat fibrous buls is very acceptable as a flavouring in soups and stews[183]. The bulb is fairly large, up to 5cm in diameter, and is produced in clusters[200]. The plant has thick iris-like rhizomes[203]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta South-western N. America - Idaho to California. ksacta Swampy meadows at medium to high elevations in the mountains[60].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. This species tolerates much wetter soils than most members of the genus but it dislikes winters with alternating periods of damp and cold and no snow cover, so it is best given a damp though well-drained soil[203]. It requires plenty of moisture in the growing season[203]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. The bulbs should be planted fairly deeply[1]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.145 Allium bisceptrum

Aspen Onion, Twincrest onion

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium bisceptrum is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves Root SeedEdible Uses: Bulb - raw or cooked[105, 161, 177, 257]. They were usually harvested in spring or early summer[257]. The bulbs are 10 - 15mm wide[200]. Leaves - raw or cooked. Used as a relish[257]. Flowers - raw. Used as a garnish on salads. The seed heads can be placed in hot ashes for a few minutes, then the seeds extracted and eaten[257].

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]

dwatta AppetizerThe plant juice has been used as an appetite restorer[257]. Although no other specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the

season[188]. Corms are not hardy outside the milder areas of Britain and should be dug up in the autumn and stored in a cool but frost free place over winter[1]. Plant out the corms in April or May about 15cm deep[79]. In areas with cool summers the plant might not manage to develop adequate corms for subsequent growing[200]. A beautiful, late flowering corm, it self-sows freely with us on a well-drained soil in Cornwall, even very wet winters do not seem to affect this plant[K]. Plants flower in their first or second year from seed[K].

#### 8.2.141 Allium wallichii

Jimbur

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.6 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Allium wallichii is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in very large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible [76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Young leaves - cooked as a vegetable[272]. The dried leaves are used as a condiment in curries and pickles[177, 183, 272]. Bulb - raw or cooked. Poorly developed and rather small[200]. The cloves are used as a substitute for garlic[272]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Cholera DysenteryThe bulbs, boiled then fried in ghee, are eaten in the treatment of cholera and dysentery[272]. The raw bulb is chewed to treat coughs and colds[272]. It is said that eating the bulbs can ease the symptoms of altitude sickness[272]. Members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta E. Asia - W. China to the Himalayas. ksacta Forest clearings and shrubberies, fully open to the monsoon rains, 2800 - 4300 metres from Pakistan to S.W. China[51].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta An easily grown plant[203], it prefers a sunny position in a light well-drained soil[1]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. It succeeds outdoors in N.W. England where it sets seed[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.142 Astroloma humifusum

Cranberry Heath 7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 0.1 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Astroloma humifusum is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. A sweet viscid pulp[46, 144, 154, 157, 177]. The taste is somewhat like apples[193]. The fruit is a drupe about 7 - 11mm wide[193, 200].

nrakta Australia - Western Australia, South Australia, Victoria, New South Wales and Tasmania. ksacta Sandy loams in the mountain zone[154]. In heathland and open forests[193, 200]. Also found on cleared land in a range of soils including sandstone, shale and heavy clay[200].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed has a hard coat and some form of scarification is necessary or the seed can take up to 5 years to germinate. Two or three periods each of 4 - 6 weeks cold stratification can reduce the time taken to germinate[175]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When large enough, plant them out into their permanent positions in late spring or early summer. Cuttings of firm young tip growths[200]. It is very difficult to obtain suitable wood[157] and the cuttings are slow to root[200].

nwatta Succeeds in most well-drained soils[200]. Established plants are moderately drought tolerant[200]. This species is hardy to about -7°c in Australian gardens[157], but this cannot be translated directly to British gardens because of our cooler summers and longer, colder and wetter winters. Plants can survive frosts in Britain, particularly if the roots are well mulched, but they are best when grown in a cold greenhouse in this country[200]. The plants have a very fine root system which makes transplanting difficult[157].

# 8.2.143 Brassica rapa

Turnip, Field mustard, Toria, Yellow sarson 7 tlin 11 cyuc 3 kcak 1 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Brassica rapa is a BIENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Leaves raw or cooked[1, 5]. The cooked leaves make an acceptable vegetable, though they are coarser than the related cabbage. They are more often used as a spring greens, sowing the plants in the autumn and allowing them to verwinter. Young leaves can also be added in small quantities to salads, they have a slightly hot cabbage-like flavour and some people find them indigestible[K]. A nutritional analysis is available[218]. Root - raw or cooked[1, 5, 16, 132]. Often used as a cooked vegetable, the young roots can also be grated and eaten in salads, they have a slightly hot flavour like a mild radish. A nutritional analysis is available[218].

tcanta Fodder InsecticideTurnip root peelings contain a natural insecticide. The chopped roots can be brewed into a tea with flaked soap, this is then strained before use. It is effective against aphids, red spider mites and flies[201].

dwatta Cancer PoulticeA decoction of the leaves or stems is used in the treatment of cancer[218]. The powdered seed is said to be a folk remedy for cancer[269]. The crushed ripe seeds are used as a poultice on burns[222]. Some caution should be exercised here since the seed of most brassicas is rubefacient[K]. The root when boiled with lard is used

tcanta Dye Oil OilA non-drying oil is obtained from the seed - used as a hair-dressing[46, 61]. The oil consists mainly of olein it is not subject to polymerize or oxidize, nor does it form solids at low temperatures[174]. A green dye is obtained from the pink or red petals[168].

dwatta Astringent Cancer Haemostatic Salve TonicThe flowers are astringent, antihaemorrhagic, haemostatic, salve and tonic[178, 218]. When mixed with sesame oil they are used in the treatment of burns and scalds[218]. The plant has shown anticancer activity[218].

nrakta E. Asia - Japan, Korea. ksacta Woods in hills and down to sea level near the coast in C. and S. Japan[58].

propta Seed - can be sown as soon as it is ripe in a green-house[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Landscape Uses:Border, Container, Espalier, Standard, Specimen. Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1. 11, 200]. A calcifuge plant, preferring a pH around 5[11, 200]. Prefers the partial shade of a light woodland[200], it also grows well on a north-west aspect[11] and on sunless walls[202]. This is a very cold hardy plant, but it cannot tolerate cold winds[11]. Plants should be given a position shaded from the morning sun in order to protect the flowers from late frosts[219]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. A very ornamental plant[11]. A large amount of named forms have been developed, mainly for their ornamental value[11, 200]. Many of them tolerate full sun[182, 200]. Camellias are a valuable commercial crop in Asia, where they are cultivated for the oil obtained from their seed. Many of the cultivars grown in Britain do not set seed, unfortunately. The following cultivars have been seen with good crops of seeds:- 'Alba Simplex'; 'Coppelia'; 'Guillio Nuccio'; 'Jupiter'[K]. The sub-species C. japonica macrocarpa. Masam. has larger fruits than the type, looking like small apples. The sub-species C, japonica rusticana (Honda,)Kitamura, is a hardier form from N. Japan where it grows at higher altitudes than the species and withstands long snowy winters[11, 219]. Special Features: Attractive foliage. Not North American native. Blooms are very showy.

#### 8.2.62 Pistacia vera

Pistachio, Pistachio Nut

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 10 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprikl-

wisslip hpa7tmwatli nyanhjen hjonli

drutta Pistacia vera is a deciduous Tree growing to 10 m (32ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 9. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Fruit Oil Oil SeedEdible Uses: Oil OilSeed - raw or cooked[2, 46, 61, 74]. The seed is rich in oil and has a pleasant mild flavour[2]. It is very nice when eaten raw and is also widely used in confectionery, ice cream, cakes, pies etc[183]. An edible oil is obtained from the seed but is not produced commercially due to the high price of the seed[183]. The fruits can be made into a flavourful marmalade[183].

tcanta Miscellany Oil Oil ResinThe seed yields up to 40% of a non-drying oil. It is not used commercially due to the high value of the seed for food[183]. Male trees yield a small quantity of a high grade resin. It is used in paints, lacquers etc1741.

dwatta Dysentery Miscellany Sedative TonicThe plant is used in China for the treatment of abdominal ailments, abscesses, amenorrhoea, bruises, chest ailments, circulation, dysentery, gynecopathy, pruritus, rheumatism, sclerosis of the liver, sores and trauma[218]. The seed is said to be sedative and tonic[240].

nrakta W. Asia. ksacta Hilly and mountainous regions, especially on sandstone soils, with a temperature range from -10°c in the winter to 40°c in the summer, to 1500 metres[200]

propta Pre-soak the seed for 16 hours in alkalized water(78), or for 3 - 4 days in warm water(1), and sow late winter in a cold frame or greenhouse(78, 113). Two months cold stratification may speed up germination, so it might be better to sow the seed in early winter(113). The germination is variable and can be slow. Prick out the seedlings into individual pots when they are large enough to handle and grow on the plants for at least their first winter in a greenhouse. Plant out into their permanent positions in early summer and consider giving some protection from winter cold for their first year or two outdoors[K]. Cuttings of half-ripe wood from juvenile trees, July in a frame[113]. Layering.

nwatta Global Crop Management: pice Management: Standard Other Systems: Strip intercrop Staple Crop: Protein-oilLandscape Uses: Specimen. Requires a sunny position in a deep well-drained light soil[200]. Succeeds in dry soils. Does well in light calcareous soils[200]. Grows well on poor soils[200]. Prefers long hot summers and low humidity[200]. Plants are not very hardy in Britain and are unlikely to succeed outdoors in any but the mildest areas of the country. They will be hardier in areas with long hot summers that will thoroughly ripen the wood. Plants are prone to fungal root rots[200] The pistachio nut is often cultivated for its edible seed in warm temperate areas, there are many named forms[183]. It is very unlikely to produce a crop of seeds in Britain, simply because the summers here are not hot enough or long enough[K]. Any pruning that needs to be done is best carried out in the spring[238]. Dioecious, male and female plants must be grown if seed is required. One male plant for every five females is adequate[200]. Special Features: Edible. Not North American native, Attractive flowers or blooms.

# 8.2.63 Camellia reticulata

To-tsubak

7 tlin 10 cyuc 3 kcak 1 tcan 0 dwat 10 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia reticulata is an evergreen Shrub growing to 10 m (32ft) by 5 m (16ft). See above for USDA hardness. It is hardy to UK zone 8. It is in leaf all year, in flower in March, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn edible oil is obtained from the seed[177, 183]. This is a particularly good oil-bearing species[180].

nrakta E. Asia - S.W. China in Yunnan. ksacta Sparse forests, open pine forests, scrub and thickets on dry often stony hillsides, 1800 - 2700 metres in Yunnan[1, 180].

propta Seed - can be sown as soon as it is ripe in a green-house[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm

with a heel, August/September in a shaded frame. High percentage but slow[78]. This species does not strike from cutings. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. This species does not strike from cuttings. Leaf-bud cuttings, July/August in a frame. This species does not strike from cuttings.

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200], but established shrubs do well in full sun. They require protection from cold winds. A very ornamental plant[1] but it is only hardy in mild areas of Britain, tolerating temperatures down to about -10°c[184]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species was named after the cultivated garden form, the true wild form is C. reticulata simplex. Sealy[180].

# 8.2.64 Phyllostachys vivax

Giant Timber Bamboo, Running giant bamboo 7 tlin 10 cyuc 3 kcak 2 tcan 0 dwat 10 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phyllostachys vivax is an evergreen Bamboo growing to 10 m (32ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - raw or cooked. A delicious flavour[266], they are almost entirely free of acridity, even in the raw state[183, 195]. The shoots, which are 4 - 8cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Basketry WoodThe culms are used for weaving articles and as handles of farm tools[266].

nrakta E. Asia - E. China in Jiangsu and Zhejiang. ksacta Plains and mountains

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position and plenty of moisture in the growing season. Dislikes prolonged exposure to hard frosts, but plants are hardy to at least -20°c[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Closely related to P. bambusoides[195]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195].

#### 8.2.65 Melia azederach

Bead Tree, Pride of India, Chinaberry 7 tlin 12 cyuc 3 kcak 4 tcan 3 dwat 9 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Melia azederach is a deciduous Tree growing to 9 m (29ft) by 9 m (29ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 9. It is in flower in June, and the seeds ripen from October to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The fruit is somewhat poisonous[2, 4, 89]. Ripe fruits are more toxic than green ones[218]. As little as six fruits have caused fatalities in children[274]. All parts of the plant contain toxins that can cause gastric tract irritation and degeneration of the liver and kidneys[274].

kcakta Edible Parts: Fruit Leaves OilEdible Uses: Drink Gum OilLeaves - cooked[2, 105]. A bitter flavour, they are used as a pot-herb, in curries, soups etc[2]. Fruit[2]. A sweetish flavour, it is eaten by children though some people believe it to be poisonous[2]. The fruit is between 1 and 5cm in diameter[200] and contains a single seed[219]. Both these reports, of edible leaves and fruits, should be treated with some caution. The fruit is poisonous according to one report where it says that the ripe fruit is more poisonous than the green fruit and that they have sometimes caused human fatalities[218]. A cooling drink is made from the sap[2] - it is actually a gum[64]. This gum is tasteless, clear to dark amber and of good solubility[64]. The sap is obtained from incisions that are made near the base of the trunk in the spring[2].

tcanta Beads Biomass Containers Fuel Furniture Gum Insecticide Lighting Oil Parasiticide Repellent Varnish WoodThe seed contains up to 40% of a drying oil[114]. It is used for lighting, varnish etc[4, 74]. The musk-scented seeds are used as beads in rosaries[1, 51, 89, 158, 245]. The fruits are a source of a flea powder and an insecticide[46, 74]. The whole fruit is ground up and used[61]. The fruit pulp is also used as an insect repellent[149]. The leaves repel mosquitoes and other insects[89, 148, 178]. Wood-tough, durable, moderately heavy, somewhat brittle, hand-somely marked, takes an excellent polish. It has a musk-like aroma[245]. It is used for making furniture, packing cases etc[114, 146, 149, 227]. Because it is fast-growing, it is often used as a fuel[272].

dwatta Anthelmintic Antiasthmatic Antirheumatic Antiseptic Aphrodisiac Astringent Bitter Diuretic Emetic Emmenagogue Febrifuge Laxative Lithontripic Parasiticide Poultice Purgative Skin Stomachic Tonic VermifugeUsed externally in the treatment of rheumatism[4, 152]. An aqueous extract reduces the intensity of asthmatic attacks[240]. (This report does not specify the part of the plant that is used[K].) The leaf juice is anthelmintic, antilithic, diuretic and emmenagogue[218, 240]. A decoction is astringent and stomachic[218]. The leaves are harvested during the growing season and can be used fresh or dried[238]. The flowers and leaves are applied as a poultice in the treatment of neuralgia and nervous headache[218, 240]. The stem bark is anthelmintic, astringent and bitter tonic[21, 176, 218]. It is used as a tonic in India[21]. It can be harvested at any time of the year and is used fresh or dried[238]. The fruit is antiseptic and febrifuge[218]. The pulp is used as a vermifuge[227]. The fruit is harvested in the autumn when it is fully ripe and can be used fresh or dried[238]. The seed is antirheumatic[218, 240]. It is used externally. The root bark is emetic, emmenagogue, purgative and vermifuge[21, 176, 218]. It is highly effective against ringworm and other parasitic skin diseases[218]. It can be harvested at any time of the year and is used fresh or dried[238]. A gum that exudes from the tree is considered by some to have aphrodisiac properties[21]. This plant should be used with caution, preferably under the supervision of a qualified practitioner[238]. Excess causes diarrhoea, vomiting and symptoms of narcotic poisoning[238].

nrakta E. Asia - N. India to China. Naturalized in the Mediterranean. ksacta Moist sunny locations[152] to 2700 metres in the Himalayas[51].

propta Seed - sow late winter in a greenhouse. The seed is best sown as soon as it is ripe in the autumn[188, 238]. The seed usually germinates well. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late

other growing plants[203]. This species is not fully hardy in Britain and is unlikely to survive in the colder parts of the country. It is only marginally hardy in N.W. England[203]. A new bulb is formed annually, the old one withering away[90]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.138 Dudleva edulis

Mission Lettuce, Fingertips 7 tlin 10 cvuc 3 kcak 0 tcan 0 dwat 0.5 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Dudleya edulis is an evergreen Perennial growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Leaves StemEdible Uses: Leaves raw. Fleshy[183]. They are considered to be a delicacy[183]. Stems - slightly sweet and refreshing to chew, though they leave a chalky taste in the mouth[183].

nrakta South-western N. America - S. California. ksacta Rocky hillsides below 1,000 metres[71]. High elevations in the Sonoran Desert[200].

propta Seed - we have no details for this species but suggest sowing the seed in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of side shoots in the summer. Dry the stem for 24 hours before planting in a very sandy soil mix[200]. The main stem can also be used, the parent plant will then produce new plantlets at the cut edge[200].

nwatta Requires a very sunny position in a well-drained soil[200]. Plants enter a semi-dormant state in late summer and they should be kept fairly dry at this time[200]. There must be some doubt over the hardiness of this species. One report says that it is hardy to zone 8 which suggests that it should tolerate occasional cold periods down to between -5 and -10°c, but the report also says that the plants should be protected from frost, with a winter temperatures no lower than 7°c[2001.

#### 8.2.139 Physalis heterophylla

Clammy Ground Cherry, Rowell's groundcherry 7 tlin 10 cyuc 3 kcak 0 tcan 1 dwat 0.9 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Physalis heterophylla is a PERENNIAL growing to 0.9 m (3ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista All parts of the plant, except the fruit, are poisonous[19, 65].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[46, 105, 161]. Quite nice raw though rather small[K], the fruit can also be made into pies, jams, sauces etc[183]. Pectin or pectin-rich fruit should be added if the fruit is used in jams and preserves[183]. The fruit can also be dried, ground into a meal and added to flour for making bread etc[183]. The plant conveniently wraps up each fruit in its own 'paper bag' (botanically, the calyx) to protect it from pests and the elements. This calyx is toxic and should not be eaten.

dwatta Antitumor Diuretic Poultice UrinaryThe seed is considered to be beneficial in the treatment of difficult urination, fever, inflammation and various urinary disorders[222]. A tea made from the leaves is used in the treatment of headaches and as a wash for burns and scalds[222]. A poultice of the leaves and roots is applied to wounds[222]. An infusion of the leaves and roots is used as a wash on scalds, burns and VD sores[257]. Compounds in the plant are being investigated for antitumor activity[222].

nrakta N. America - New Brunswick to Saskatchewan, Florida, Colorado and Texas. ksacta Dry open woods[43]. Rich soils, especially where the surface has been disturbed[235].

propta Seed - sow March/April in a greenhouse only just covering the seed. Germination usually takes place quickly and freely. Prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle and plant them out after the last expected frosts. Consider giving them some protection such as a cloche until they are growing away well. Diurnal temperature fluctuations assist germination[170]. Division in spring[111]. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings in early summer[111]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in any well-drained soil in full sun or light shade[200]. A polymorphic species[43]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is fibrous dividing into a large number of fine roots [1-2]. The root pattern is rhizomatous with underground stems sending roots and shoots along their length [1-2]

# 8.2.140 Tigridia pavonia

Tiger Flower

1355

7 tlin 10 cyuc 3 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Tigridia pavonia is a CORM growing to  $0.6~\mathrm{m}$  (2ft) by  $0.1~\mathrm{m}$  (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from June to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Corm -cooked[2, 46, 61, 105]. Delicious when baked, tasting like a sweet potato[K]. The corm is quite small unfortunately and so will never be more than a very tasty occasional treat[K]. The corm has an unpleasant, burning sensation on the mouth if it is eaten raw[K].

dwatta InfertilityThe plant has been used to promote fertility[200].

nrakta Southern N. America - Mexico. ksacta Oak and pine forests, it is also frequent on roadsides and in semi-wild habitats[90].

propta Seed - sow early spring in a greenhouse. It usually germinates freely. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring, after the last expected frosts. If the seedlings are potted up whilst still small and grown on quickly, they sometimes flower in their first year[K]. Division of offsets in the autumn. Store the corms in a cool but frost-free place and plant them out in the late spring. It is probably best to pot up the smaller corms and grow them on in a greenhouse for a year before planting them out in the spring.

nwatta Prefers a well-drained light sandy soil in a warm sunny position[1, 42]. Likes plenty of moisture in the growing

ticularly efficient at high temperatures, in bright sunlight and under dry conditions [196].

#### 8.2.135 Helianthus cusickii

Cusick's sunflower

7 tlin 10 cyuc 3 kcak 0 tcan 1 dwat 0.6 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Helianthus cusickii is a PERENNIAL growing to 0.6 m (2ft) by 0.2 m (0ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Oil Root SeedEdible Uses: OilEdible Portion: Seeds, Roots. The roots are peeled and eaten raw. Carbon Farming Solutions - Staple Crop: protein-oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1]. Perennial crops are being developed for their oil-seed. The Land Institute see them as part of a perennial polyculture system. Helianthus cusickii is an arid US western mountain species not tolerant of boreal conditions but grows on poor soils [1-1].

tcanta OilNone Known

dwatta The root was used by US Plateau Indian tribes to treat erectile dysfunction, wasting, and tuberculosis.

nrakta N. America. Native to the western United States from Washington, Oregon, Idaho, northern California, and northwestern Nevada. ksacta Dry grassy slopes, open woodland, mountain forests and foothills. Elevation: 1050-1300m. propta Seed

nwatta Management: Standard Staple Crop: Proteinoil Under DevelopmentClimate: cold to warm temperate. Humidity: arid to semi-arid. A perennial wildflower herb. Poor soils. Flowering Time: Late Spring, Early Summer. Cultivation: under development. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1]

### 8.2.136 Allium cupanii

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.3 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Allium cupanii is a BULB growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[177]. The bulb is up to 15mm in diameter[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta S. Europe - Mediterranean to W. Asia. ksacta Pinus nigra forest, amongst Quercus parygana, alpine and grey steppe rocky places on limestone, serpentine and schist, to 2200 metres in Turkey[93].

propta Seed - sow spring in a cold frame. Prick out the sedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Requires a sunny position in a light well-drained soil[1, 2031. Only hardy in the milder areas of the country, tolerating temperatures down to between -5 and -10°c[200]. The bulbs show some summer dormancy and so are best grown in a bulb frame, water being withheld in late sumer[203]. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile, but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.137 Allium unifolium

One-Leaved Onion

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 0.6 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Allium unifolium is a BULB growing to 0.6 m (2ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in very large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible [76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked[161, 177, 257]. The bulbs are 10 - 15mm in diameter[200]. Together with the young shoots, they are fried and eaten[183]. Leaves - raw or cooked[183]. Flowers - raw. Used as a garnish on salads.

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20].

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta South-western N. America - California and Oregon. ksacta Moist soils in pine or mixed evergreen forest in the coastal ranges of California [60, 90].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a hot dry sunny position in a light, rich well-drained soil[90, 200]. This species is difficult to maintain under cultivation in Britain, our weather is probably too wet and cool for it to really thrive[142]. The plant has a summer resting period when it should be kept dry and so it is best grown in a cold greenhouse or bulb frame[203]. Placing a cloche over outdoor-grown plants in the summer, especially after flowering, will help to ripen the bulbs[142]. Most members of this genus are intolerant of competition from

spring or early summer, after the last expected frosts[78]. Root cuttings[113].

nwatta Industrial Crop: Biomass Industrial Crop: Oil Industrial Crop: Pesticide Management: pice Management: Standard Minor Global CropRequires a sunny sheltered position[166]. Succeeds in most welldrained soils and in hot dry conditions[200]. Likes sandy soils[188]. Grows well in mild coastal areas[188]. A very ornamental tree[1], it is not very cold tolerant being killed by temperatures lower than about -5°c[260]. It only succeeds outdoors in the mildest areas of Britain[166], seldom growing larger than a shrub[182]. It is hardy on a sunny wall in S.W. England[11, 219]. It is often cultivated in warmer regions than Britain for its many useful qualities[1]. The flowers are produced on the current years wood and have a delicate sweet perfume[182, 245]. The trees do not normally require pruning[219]. The seeds have a strong scent of musk and the wood is also musk-scented[245]. Trees are very susceptible to forest fire, though they sprout back readily from the roots[229]. They are planted for re-afforestation in their native areas, where they are fast growing though short-lived[200, 229]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Invasive, Naturalizing, All or parts of this plant are poisonous, Fragrant flowers, Inconspicuous flowers or blooms

#### 8.2.66 Ouercus brantii

Barro Brant's oak

7 tlin 9 cyuc 3 kcak 3 tcan 2 dwat 8 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli hjonli

drutta Quercus brantii is a deciduous Tree growing to 8 m (26ft) by 8 m (26ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista All parts of the plant contain tannins. Whilst tannins are found in many foods, and have a range of medicinal uses. They are usually only present in low concentrations. In some foods made from oaks (particularly the seeds), the tannin content can be quite high unless the food is treated to reduce tannin content. Tannins are only of low toxicity and, because of their bitter taste and astringency, are unlikely to be eaten in large quantities. However, if they are taken in excess, they can cause stomach pains; constipation followed by bloody diarrhoea: excessive thirst; and excessive urination[293].

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed raw or cooked[317]. The seed is 30 - 50mm long and 12 -22mm wide[1223]. The seed is usually cooked before eating, though it can also be eaten raw. It can be eaten whole, though it is more commonly dried, then ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. In some species, especially many of those classified as 'white oaks' the seeds are low in tanning and have a more or less sweet and agreeable flavour. The seed of most species, however, have a very bitter flavour. due especially to the presence of tannins. In these species there are various processes that can remove or at least reduce the amount of these bitter substances (although other water-soluble substances, including some minerals, will also be removed). Tannins are water-soluble and therefore the easiest way to remove or reduce tannin levels is by soaking in water. A few different methods are listed:- A traditional method of preparing the seed was to bury it in boggy ground overwinter and allow the wet soil to gradually leach the tannins. The germinating seed was dug up in the spring when it would have lost most of its astringency and bitterness. Another method was to wrap the seeds in a cloth bag and place them in a stream for several weeks. Drying the seed and grinding it to a powder before soaking speeds up the process. The fastest method is to use hot water, by cooking the powder and changing the water several times until the cooking water is no longer bitter. Alternatively, you can use cold water (which is reported to produce the best quality flour).

In this case, you soak the powdered seed in cold water for 12 - 24 hours then discard the water. Repeat this process for a number of times until the soak water is no longer bitter. The roasted seed is used as a coffee substitute[317]. Carbon Farming - Staple Crop: balanced carb.

tcanta Dye Fodder Fuel Furniture Ink Mulch Tannin Teeth Waterproofing WoodThe leaves of most species in this genus are more or less rich in tannins. A mulch of the partially decayed leaves can be placed around vulnerable plants in order to repel slugs, snails, grubs etc, and these will in time break down to add humus and nutrients to the soil. Fresh leaves should be used with caution, however, since as these decay they utilize some of the nitrogen in the soil and thus can inhibit plant growth[20, K].. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff and is also used by many cultures to make ink[4 . 331 l. The bark of oak trees is also usually rich in tannins and can be used as a dyestuff and for waterproofing rope[331 , K ]. As a source of wood and lumber the genus Quercus is one of the most important of all groups of trees. We have no specific information for this species, but in general the timber is noted for its strength, durability, and beauty, and is used everywhere for innumerable purposes, ranging from fuel to railroad ties, construction of buildings and ships, interior trim, flooring, and all grades of furniture. The woods of different species vary as to their physical qualities; some of them are very hard and tough, others are lighter in weight, softer, and less tough[331]. The wood is a favoured fuelburning well and giving off a lot of heat. It is also used for making a good quality charcoal[331, 1223]. Carbon Farming - Industrial Crop: tannin. Fodder: mast.

dwatta Antibacterial Antidiarrhoeal Antifungal Antiinflammatory Antiseptic Astringent Dysentery Haemostatic Mouthwash Skin StypticThe seeds are used in traditional medicine[317]. No further details are given[K]. Quercus (oak) species are used in the traditional medicine of many cultures, being valued especially for their tannins. Various parts of the plant can be used, most frequently it is the leaves, bark, seeds, seed cups or the galls that are produced as a result of insect damage. A decoction or infusion is astringent. antibacterial, antifungal, antiseptic, styptic and haemostatic. It is taken internally to treat conditions such as acute diarrhea, dysentery and haemorrhages. Externally, it is used as a mouthwash to treat toothache or gum problems and is applied topically as a wash on cuts, burns, various skin problems, haemorrhoids and oral, genital and anal mucosa inflammation[4]. Extracts of the plant can be added to ointments and used for the healing of cuts[4, 1231].

nrakta W. Asia - eastern Turkey, Iraq, Iran, Caucasus ksacta Limestone slopes; at elevations from 350 - 1,700 metres[1212].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Fodder: Mast Industrial Crop: nin Management: Standard Regional Crop Staple Crop: Balanced carbClimate: warm temperate. Humidity: semiarid. Quercus brantii is a plant of arid and semi-arid environments, and is able to withstand moderate amounts of frost, surviving temperatures falling to around -5°c or perhaps lower when dormant, especially if the summers are hot. Ouercus species generally grow well in a sunny position, though young plants usually tolerate reasonable levels of side shade[200]. They usually prefer a good deep fertile loam which can be on the stiff side[1, 11]. They are also often tolerant of moderate exposure, surviving well but being somewhat stunted[200]. Established plants of this species are highly drought tolerant[1212]. Seedlings soon develop a taproot and become intolerant of root disturbance, they should be planted into their permanent positions whilst young[11]. Most Quercus species hybridize freely with

notably resistant to honey fungus[200]. Carbon Farming -Cultivation: regional crop. Management: standard.

### 8.2.67 Phyllostachys rubromarginata

Reddish bamboo

7 tlin 10 cyuc 3 kcak 2 tcan 0 dwat 8 m hkuc

hmimhtut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phyllostachys rubromarginata is an evergreen Bamboo growing to 8 m (26ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots - cooked[195]. They have a small degree of acridity when raw but this is removed if they are boiled in water, they are then eaten in salads etc[183]. The shoots, which are about 35mm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta Basketry WoodThe canes are used for plant supports, making musical pipes and weaving baskets etc[195,

nrakta E. Asia - China in Zhejiang and Guangxi. ksacta Not known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position and plenty of moisture in the growing season. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It dislikes prolonged exposure to hard frosts. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Cultivated for its edible shoots in China[195]. Plants show a remarkably high survival rate when planted out[195]. Commercial plantings in America averaged around 86% success rate[195]. (This probably refers to divisions) In tests in Alabama, USA, this species was considerably more productive than any other member of this genus in producing canes as measured by number and by weight of the wood[195]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195].

#### 8.2.68 Bambusa textilis

Clumping Bamboo. Weaver's bamboo 7 tlin 11 cyuc 3 kcak 4 tcan 0 dwat 8 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Bambusa textilis is an evergreen Bamboo growing to 8 m (26ft) by 1.5 m (5ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

other members of the genus[200 ]. Plants in this genus are well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

ncista None Known

kcakta Edible Parts: ShootsEdible Uses: Edible Portion:

tcanta Biomass Fodder Hedge StrawCarbon Farming Solutions - Industrial Crop: biomass (Crops grown for nonfood uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. Fodder: bank. Other Systems: strip intercrop, multistrata. Good hedging/screening in full sun to part shade. Tolerates rigorous pruning of tops to 1m. Tight footprint to 1m. A good specimen plant. Good for pots.

dwatta None Known

nrakta Australasia. ksacta Usually cultivated along rivers and near villages at low altitudes in southern China.

propta By dividing the rootball, rhizomes, tubers, corms or bulbs (including offsets)

nwatta Fodder: Bank Industrial Crop: Biomass Manage Managed Multistem Minor Global Crop Other Systems: Multistrata Other Systems: Strip intercropA clumping noninvasive bamboo. Climate: warm temperate to tropical. Humidity: humid. Both hardy and drought resistant once established and tolerates sandy soils, winds and light frosts. Tolerates rigorous pruning of tops to 1m. Tight footprint to 1m. Carbon Farming Solutions - Cultivation: minor global crop. Management: managed multistem (Describes the non-destructive management systems that are used in cultivation) [1-1]. .

#### 8.2.69 Abutilon vitifolium

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Abutilon vitifolium is an evergreen Shrub growing to 8 m (26ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers - raw. The flowers are up to 8cm in diameter[219]. A delicious mild flavour with a slight sweetness, they have a pleasant mucilaginous texture and can be eaten in quantity as part of a salad[K].

nrakta S. America - Chile. ksacta Open places in warm temperate forests[260].

propta Seed - sow spring in a greenhouse[200]. Germination should take place within a few weeks. Once the seedlings are large enough to handle, prick them out into individual pots. Grow them on for at least the first winter in a greenhouse and plant out in late spring or early summer, after the last expected frosts. Cuttings of young shoots, June in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200], Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts.

nwatta An easily grown plant, fast to establish and flower from seed and growing best in coastal areas[260]. In hot summer climates it requires partial shade, plus ample humidity and moisture in the growing season[260]. Requires a sunny position or part day shade in a fertile well-drained soil[200]. Dislikes drought[200]. Plants do not like windy conditions[260]. This species is only hardy in the mildest areas of Britain, tolerating temperatures down to between -5 to -10°c when given the protection of a south or southwest facing wall[11, 184, 200]. Plants are often deciduous in cold winters[219]. A deep mulch in winter and tying in growth to the wall will maximise protection in winter[200]. If the plant is cut back by cold weather, it will normally resprout from the base in the spring and can flower on the current year's growth[202]. A plant of the cultivar 'Album', growing in an open position at Westonbirt Arboretum, was 2

female organs) and is pollinated by Bees. The plant is selffertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: TeaLeaves[160]. No further details are given, but they are most likely to be used as an aromatic flavouring in salads and cooked foods[K]. Seed - raw or cooked[105, 161, 177, 183, 212, 257]. The seed is very small and fiddly to use[K]. The dried flowers and leaves are used to make a herbal tea[183].

dwatta Analgesic Antirheumatic StomachicThe leaves are analgesic and antirheumatic[257]. A decoction is taken internally in the treatment of rheumatism, measles, stomach pains and colds[257]. Externally, a poultice of the mashed leaves is applied to swellings[257].

nrakta Western N. America - Montana to British Columbia, south to California and Colorado. ksacta Moist soils of open hillsides, canyons and mountain valleys, from the foothills to about 2,500 metres[212].

propta Seed - sow spring in a greenhouse and only just cover the seed. The seed usually germinates in 1 - 3 months at 13°c[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant out in late spring or early summer[K]. Division in spring. Fairly simple, if large divisions are used it is possible to plant them straight out into their permanent positions. Basal cuttings of young shoots in spring[111]. Harvest the young shoots when they are about 10 - 15cm tall and pot them up in a lightly shaded position in a greenhouse. They should root within 3 weeks and can be planted out in the summer or following spring.

nwatta Prefers a warm sunny sheltered position and a well-drained soil. Succeeds in most soils. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. A plant is growing in a sunny bed at Kew Botanical gardens and appears fully hardy there[K]. This species withstands temperatures down to about -40°c when fully dormant[160]. The flowers are very attractive to bees

#### 8.2.133 Brodiaea coronaria

Californian Hyacinth, Crown brodiaea, Indian Valley brodi-

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 0.3 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Brodiaea coronaria is a CORM growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit RootEdible Uses: Corm raw or cooked[105, 161, 177]. Baked or boiled and eaten like potatoes[257]. When slowly roasted, it becomes very sweet[95]. Edible fruit[2]. This report is rather dubious and possibly refers to the seedpod since the seed is encased in a small dry capsule[K].

nrakta Western N. America from British Columbia to California. ksacta Gravelly prairies, grassy slopes and rocky buffs[60]. Grasslands, volcanic mesas from sea level to 1600 metres[270].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. The seed can also be sown in spring in a cold frame[138]. Germination usually takes place within 1 - 3 months at 15°c[138]. Sow the seed thinly so that it will not require thinning and grow the seedlings on undisturbed in the pot for their first year. Pot up the small bulbs when they are dormant in early autumn and grow them on for at least another year before planting them out when dormant in the autumn. Seedlings are prone to damping off, they should be watered with care and given plenty of ventilation[138]. Division in autumn[188]. Dig up the clumps of corms when they are dormant, divide them and replant the larger corms into their permanent positions. It is best to pot up the smaller

corms and grow them on for a year in a cold frame, planting them out in late summer or the autumn.

nwatta Prefers a rich sandy loam and a well-drained soil in a sheltered position[1, 188]. Succeeds in most soils and situations[42]. Likes plenty of moisture whilst in growth, followed by a warm dry period in late summer to autumn[200]. Plants may require protection in severe winters[1], they are susceptible to rot in wet winters[200]. They die down in the summer after flowering[188]. A very ornamental plant[2], it can flower in 2 years from seed[138].

# 8.2.134 Amaranthus viridis

Calalu. Slender amaranth

7 tlin 11 cyuc 3 kcak 1 tcan 2 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Amaranthus viridis is a ANNUAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 9 and is frost tender. It is in leaf from April to October, in flower from July to September, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista No members of this genus are known to be poisonous, but when grown on nitrogen-rich soils they are known to concentrate nitrates in the leaves. This is especially noticeable on land where chemical fertilizers are used. Nitrates are implicated in stomach cancers, blue babies and some other health problems. It is inadvisable, therefore, to eat this plant if it is grown inorganically.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves cooked as a spinach[46, 61, 144, 177, 183]. A mild flavour[K]. The leafy stems and flower clusters are similarly used[183]. On a zero moisture basis, 100g of leaves contains 283 calories, 34.2g protein, 5.3g fat, 44.1g carbohydrate. 6.6g fibre, 16.4g ash, 2243mg calcium, 500mg phosphorus, 27mg iron, 336mg sodium, 2910mg potassium, 50mg vitamin A, 0.07mg thiamine, 2.43mg riboflavin, 11.8mg niacin and 790mg ascorbic acid[218]. Seed - cooked. Very small, about 1mm in diameter[266], but it is easy to harvest and very nutritious[K]. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K]. The seed contains 14 - 16% protein and 4.7 - 7% fat[218]. The nutty edible seeds can be eaten as snacks or used in biscuits. A porridge can be made by boiling the seeds in water. In northeastern Indian it is known as Cheng-kruk and eaten traditionally as a vegetable. In South India it is known as Kuppacheera. It is also a common vegetable in Bengali cuisine and is called "note shak.

tcanta DveYellow and green dves can be obtained from the whole plant[168]

dwatta Astringent Dysentery VermifugeA decoction of the entire plant is used to stop dysentery and inflammation[218]. The plant is emollient and vermifuge[218, 240]. The root juice is used to treat inflammation during urination[272]. It is also taken to treat constipation[272].

nrakta Tropical N. America? Original habitat is obscure. ksacta A weed of waste ground and roadsides but the original habitat is obscure[144].

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easilv[206].

nwatta Prefers a well-drained fertile soil in a sunny position[200]. Requires a hot sheltered position if it is to do well[K]. Plants should not be given inorganic fertilizers, see notes above on toxicity. Cultivated as a food plant in the tropics[46]. Should this plant be called A. caudatus. L. 'Viridis'[200]? Most if not all members of this genus photosynthesize by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is par-

because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam[11, 166, 200] in sun or semi-shade but plants produce less fruit when they are grown in the shade[200]. Tolerates maritime exposure. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Very closely related to A. columbiana but with a more southerly range[11]. Plants can regenerate after a forest fire from a mallee-like base[166]. Plants resent root disturbance and should be placed in their final positions as soon as possible[11, 134].

### 8.2.129 Ribes gayanum

7 tlin 10 cvuc 3 kcak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ribes gayanum is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[200]. A fine taste[177]. The fruit is about the size of a pea and is hairy[11, 200].

nrakta S. America - Chile. ksacta Not known

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Stored seed requires 4 - 5 months cold stratification at between 0 to 9°c and should be sown as early in the year as possible[113, 164]. Under normal storage conditions the seed can remain viable for 17 years or more. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter, planting them out in late spring of the following year. Cuttings of half-ripe wood, 10 - 15cm with a heel, July/August in a frame[78, 113]. Cuttings of mature wood of the current year's growth, preferably with a heel of the previous year's growth. November to February in a cold frame or sheltered bed outdoors[78, 200].

nwatta Easily grown in a moisture retentive but welldrained loamy soil of at least moderate quality[11, 200]. Plants are quite tolerant of shade though do not fruit so well in such a position[11]. This species is not hardy in the colder areas of the country, though it has succeeded outdoors at Kew for many years[11] and tolerates temperatures down to between -5 and -10°c[200]. A very ornamental plant[1]. The flowers have a soft sweet perfume[245]. Plants can harbour a stage of 'white pine blister rust', so they should not be grown in the vicinity of pine trees[155]. Plants in this genus are notably susceptible to honey fungus[200]. A suckering

# 8.2.130 Astroloma pinifolium

7 tlin 10 cvuc 3 kcak 0 tcan 0 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Astroloma pinifolium is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the

shade. It prefers dry or moist soil and can tolerate drought. kcakta Edible Parts: FruitEdible Uses: Fruit - raw. Sweet and succulent when fully ripe[200]. The fruit is about 5mm in diameter[200].

nrakta Australia - Western Australia, South Australia, Victoria, New South Wales and Tasmania. ksacta In heathland and open dry sclerophyll forests on sandy soils[200,

propta Seed - best sown as soon as it is ripe in a cold frame. The seed has a hard coat and some form of scarification is necessary or the seed can take up to 5 years to germinate. Two or three periods each of 4 - 6 weeks cold stratification can reduce the time taken to germinate[175]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When large enough, plant them out into their permanent positions in late spring or early summer. Cuttings of firm young tip growths[200]. It is very difficult to obtain suitable wood[157] and the cuttings are slow to root[200].

nwatta Succeeds in most well-drained soils[200]. Established plants are moderately drought tolerant[200]. This species can survive frosts in Britain, particularly if the roots are well mulched, but they are more safely grown in a cold greenhouse in this country[200]. They will probably be all right in sheltered coastal gardens[200]. The roots are prone to fungal infection, so the plant must be grown in a welldrained soil[200]. The plants have a very fine root system which makes transplanting difficult[157].

#### 8.2.131 Agastache neomexicana

New Mexico Giant Hyssop, Bill Williams Mountain giant hys-

7 tlin 10 cyuc 3 kcak 2 tcan 1 dwat 1.2 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hionli

drutta Agastache neomexicana is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is selffertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil

kcakta Edible Parts: LeavesEdible Uses: TeaThe highly aromatic young leaves are used as a flavouring in cooked dishes[183, 257]. The young leaves are used to make a herbal tea[183].

tcanta Attracts wildlife.

dwatta Febrifuge SalveThe dried and pulverized root has been used as a dusting powder for sores and cankers[257]. The plant has been used in the treatment of fevers and bad coughs[257].

nrakta South-western N. America, ksacta Not known propta Seed - sow spring in a greenhouse and only just cover the seed. The seed usually germinates in 1 - 3 months at 13°c[133]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first year. Plant out in late spring or early summer[K]. Division in spring. Fairly simple, if large divisions are used it is possible to plant them straight out into their permanent positions. Basal cuttings of young shoots in spring[111]. Harvest the young shoots when they are about 10 - 15cm tall and pot them up in a lightly shaded position in a greenhouse. They should root within 3 weeks and can be planted out in the summer or following spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain. The closely related A. pallidiflora (some authorities consider this species to be no more than a sub-species of A. pallidiflora) is hardy in the milder areas of the country [200, 257] The following notes are based on the general needs of the genus. Prefers a warm sunny sheltered position and a well-drained soil. Succeeds in most soils. The flowers are very attractive to bees.

#### 8.2.132 Agastache urticifolia

1352

Giant Hyssop, Nettleleaf giant hyssop 7 tlin 10 cvuc 3 kcak 0 tcan 1 dwat 1.2 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Agastache urticifolia is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and

metres tall and flowering prolifically in June 1994[K]. Plants basic (mildly alkaline) soils. It can grow in semi-shade (light tend to be short-lived in Britain, dying suddenly without any apparent cause. This is probably because they flower so profusely that they die of exhaustion[11]. They produce an abundance of fertile seed, however, and this normally breeds true to type, whether from the white or the purple-flowered form[11]. Dead-heading plants to prevent seeding can enhance longevity[200]. Tip-prune young plants to promote a bushy habit, older plants can be cut back hard annually in spring if required[200]. There are some named forms, selected for their ornamental value[200]. 'Album' has very nice tasting flowers[K]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.70 Abutilon x suntense

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Abutilon x suntense is an evergreen Shrub growing to 8 m (26ft) by 5 m (16ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers raw[K]. The flowers are up to 6cm in diameter[219]. A mild flavour with a slight sweetness and pleasant mucilaginous texture[K].

nrakta A hybrid of garden origin, A. ochsenii x A. vitifolium. ksacta Not known in the wild.

propta Seed - sow spring in a greenhouse[200]. Germination should take place within a few weeks. Once the seedlings are large enough to handle, prick them out into individual pots. Grow them on for at least the first winter in a greenhouse and plant out in late spring or early summer, after the last expected frosts. Although this species is a hybrid, seedlings are usually true to type[260]. Cuttings of young shoots, June in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts.

nwatta Requires a sunny position or part day shade in a fertile well-drained soil[200]. Dislikes drought[200]. This species is only hardy in the mildest areas of Britain, tolerating temperatures down to between -5 to -10°c when given the protection of a south or south-west facing wall[11, 200]. It is probably hardier than either of its parents[11]. Plants are often deciduous in cold winters[219]. A deep mulch in winter and tving in growth to the wall will maximise protection in winter[200]. If the plant is cut back by cold weather, it will normally resprout from the base in the spring and can flower on the current year's growth[202]. Plants grow very rapidly for their first few years and need staking if they are not in a sheltered position[11]. Plants tend to be short-lived in Britain, dying suddenly without any apparent cause. This is probably because they flower so profusely that they die of exhaustion[11]. Dead-heading plants to prevent seeding can enhance longevity[200]. Tip-prune young plants to promote a bushy habit, older plants can be cut back hard annually in spring if required[200]. There are some named forms. selected for their ornamental value[11, 200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.71 Cordyline indivisa

Cabbage Tree

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 8 m hkuc hmimhtut cyutli tcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cordyline indivisa is an evergreen Tree growing to 8 m (26ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and

woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit Leaves Root StemEdible Uses: SweetenerRoot - baked[173]. Pith of the trunk - dried and steamed until soft[173]. Sweet and starchy, it is used to make porridge or a sweet drink[173]. The root and stems are rich in fructose, the yields compare favourably with Sugar Beet (Beta vulgaris altissima)[153]. Edible shoots - a cabbage substitute[105, 128, 173]. The leaves are very fibrous even when young, we would not fancy eating them[K]. Edible fruit[2, 105, 177]. The fruit is about 6mm in diameter[200].

tcanta Basketry FibreThe leaves contain saponins, but not in commercial quantities[153]. The leaves contain a strong fibre, used for making paper, twine, cloth, baskets, thatching, rain capes etc[1, 46, 61, 128, 153]. The whole leaves would be used for some of these applications. This species makes very strong rain capes[153]. The midrib of the leaves provides a fine red-coloured strip for plaiting. It makes a very strong rope, lasting longer in water than Phormium tenax[153].

nrakta New Zealand. ksacta Wetter mountains in North and South Islands[44]. Openings in wet forests[260].

propta Seed - pre-soak for about 10 minutes in warm water and sow in late winter to early spring in a warm greenhouse[78, 164]. The seed usually germinates in 1 - 3 months at 25°c[164]. There is usually a good percentage germination[78]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring after the last expected frosts and give the plants some protection in their first winter outdoors[K]. Stem cuttings cut off the main stem just below the head and then saw off 5cm thick blocks of stem and place them 3cm deep in pure peat in a heated frame. Keep them moist until they are rooting well, then pot them up into individual pots. Plant out in late spring after the last expected frosts. Suckers. These are best removed in early spring and planted out in situ. Protect the division from wind and cold weather and do not allow the soil to become dry until the plant is established. Divisions can also be potted up and grown on until established, planting them out in the summer.

nwatta Prefers a good sandy loam rich in humus[1, 11]. Succeeds in full sun or light shade[188]. Likes a rich soil[11]. Plants grow well in coastal areas[260]. Plants are not very hardy in Britain, they tolerate temperatures down to about -3°c[260] though one report says that they can survive occasional lows down to about -10°c[11]. They succeed outdoors in the milder areas of Britain[11]. This species is more tender than C. australis[49, 59]. A very ornamental plant[1], it should be planted in its permanent position as soon as possible after the first winter[11]. Mice often kill young plants by eating out the pith of the stem[11].

#### 8.2.72 Aristotelia serrata

7 tlin 10 cvuc 3 kcak 0 tcan 1 dwat 7.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Aristotelia serrata is a deciduous Tree growing to 7.5 m (24ft 7in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower in May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 46, 61, 173]. A delicious taste[153]. The fruit is about 7mm in diameter[200].

tcanta Charcoal Dye WoodYields a blue/black dye[153]. No further details are given. The wood is used in cabinet making, turnery, inlay etc[46, 61] as well as for making charcoal[46, 128].

dwatta Antirheumatic Ophthalmic PoulticeAn tirheumatic, ophthalmic, poultice[61].

1329

nrakta New Zealand. ksacta Forest and scrub from

lowland to montane areas in North, South and Stewart Islands[44, 173].

propta Seed - sow spring in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Once the plants are at least 20cm tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving them some protection from the cold for at least their first winter outdoors. Cuttings of half-ripe wood, July/August in a frame[11]. Cuttings of mature wood of the current season's growth in early winter[1]. Take cuttings 15 - 30cm long and plant them in pots or the open soil in a greenhouse. They normally root very easily and can be potted up in early summer then planted out late the following spring[K].

nwatta Prefers a slightly acid, moderately fertile well-drained soil in full sun with shelter from cold drying winds[200]. Plants grow best in light shade[219]. Plants are only hardy in the milder and moister areas of Britain[1, 11], growing well in light woodland[166]. If cut back in severe winters they will often resprout from the sturdier branches[219]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. In its native New Zealand, this is one of the first plants to colonize areas of cleared woodland or waste ground[219]. Plants do not really require pruning[219]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.73 Drimvs winteri

Winter's Bark

7 tlin 10 cyuc 3 kcak 3 tcan 2 dwat 7.5 m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Drimys winteri is an evergreen Shrub growing to  $7.5 \mathrm{~m}$  (24ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista The sap of this plant can cause serious inflammation if it comes into contact with the eyes[139].

kcakta Edible Parts: Edible Uses: CondimentThe aromatic pungent bark is powdered and used as a pepper substitute in Brazil, Chile and Argentina[2, 46, 69, 183]. It is rich in vitamin C[22].

tcanta Essential Parasiticide WoodThe powerfully aromatic bark contains resinous matter and 0.64% of aromatic essential oil[245]. Wood - not durable, heavy (it sinks in water) - interior of houses, boxes etc. It burns badly with a smell[46, 61, 69, 139].

dwatta Antidandruff Antiscorbutic Aromatic Febrifuge Parasiticide Skin Stimulant Stomachic Vitamin CThe bark is a pungent bitter tonic herb that relieves indigestion[238]. It is antiscorbutic, aromatic, febrifuge, skin, stimulant and stomachic. An infusion of the bark is used in the treatment of indigestion, colic, dandruff and scurvy[4, 46, 69, 139]. Zall It is also used as a parasiticide[4, 46, 69, 139]. The bark is harvested in the autumn and winter and is dried for later use[238].

nrakta Southern S. America - Chile, Argentina. ksacta The dominant tree in moister lowland sites to Tierra Del Fuego[69]. Boggy sites by streams etc in rich soils[139].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow on the plants for at least their first winter in a cold frame. Plant them out in late spring or early summer, after the last expected frosts. Layering in March/April. Takes 12 months[78]. Cuttings of half-ripe wood, 10 - 15 cm with a heel, July/August in a frame. Approximately 60% take[78]. Cuttings of mature wood of the current year's growth with a heel of older wood. November in a cold frame[78].

nwatta Requires a light lime-free soil in semi-shade[202]. Tolerates chalk in the soil[11]. Requires a deep moist soil[11]. Dislikes dry conditions[139]. Prefers

a warm sandy loam with some shelter[1]. Fairly wind resistant[49, 166]. Another report says that the plant resents severe wind-chill[202]. Succeeds against a wall at Kew[K] and it thrives in an open position in S.W. England[11, 49, 59]. Tolerates temperatures down to about -10°c[184]. This species is less hardy than D. lanceolata but it usually recovers from damage[120]. Another report says that it is hardier than D. lanceolata[200]. A very ornamental plant[11]. The sub-species D. winteri andina. Reiche, is a slow growing dwarf form seldom exceeding 1 metre in height[182]. It usually commences flowering when about 30cm tall[238]. A polymorphic species[139]. The flowers have a delicate fragrance of jasmine, whilst the bark has a powerful aromatic smell[245]. This plant was a symbol of peace to the indigenous Indian tribes of S. America in much the same way as an olive branch was used in Greece[139]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.74 Actinidia callosa henryi

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Actinidia callosa henryi is a deciduous Climber growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from May to June, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The fruit is grayish-green when fully ripe and can vary from 15 - 50mm in diameter[266]. It contains a number of small seeds, but these are easily eaten with the fruit[K].

nrakta E. Asia - S.W. China. ksacta Climbing into trees in forests, thickets and valleys at elevations of 500 - 2600 metres in western and southern China[266].

propta Seed - sow spring in a greenhouse[133]. It is probably best if the seed is given 3 months stratification[113], either sow it in a cold frame as soon as it is ripe in November or as soon as it is received. Fresh seed germinates in 2 - 3 months at 10°c, stored seed can take longer[133]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in the greenhouse for at least their first winter. When the plants are 30cm or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts[K]. Most seedlings are male[126]. The seedlings are subject to damping off, they must be kept well ventilated[113]. Cuttings of softwood as soon as ready in spring in a frame[K]. Cuttings of half-ripe wood, July/August in a frame. Very high percentage[113]. Cuttings of ripe wood. October/November in a frame.

nwatta Prefers a sound loamy neutral soil[1, 200]. Succeeds in semi-shade but full sun is best for fruit production[200]. Prefers a sheltered position[200]. Plants are not fully hardy in much of Britain[219]. Young spring growth is susceptible to frost damage[160]. Fruits are formed on second year wood and also on fruit spurs on older wood[126], any pruning is best carried out in the winter[219]. This is a climbing plant, supporting itself by twining around branches etc[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.75 Phyllostachys propingua

7tlin 10 cyuc 3 kcak 0 tcan 0 dwat 6 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys propinqua is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium

easy, the suckers can be planted out direct into their permanent positions. Layering.

mwatta An easily grown plant, succeeding in most soils[11]. It does not require a rich soil, flowering and fruiting better in a well-drained soil of moderate quality[11]. Succeeds in impoverished soils[200]. Requires a sunny position[200]. Tolerates maritime exposure[200]. This species is not very hardy outside the milder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200].

# 8.2.127 Lilium longiflorum

White Trumpet Lily, Easter lily, Trumpet Lily 7 tlin 9 cyuc 3 kcak 2 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Lilium longiflorum is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - cooked[177]. Mild flavoured and slightly sweet[183]. A starch is also extracted from the bulb[105, 183]. The bulb is 25 - 50mm in diameter[266]. It can be used as a vegetable in similar ways to potatoes(Solanum tuberosum). Young leaves and stems - cooked[105, 177, 183]. Eating the leaves and stems severely harms the vitality of the bulb and is not recommended. Flowers[183]. No further details are given. The flower buds are eaten according to another report[177].

tcanta EssentialAn essential oil is obtained from the flowers, used in perfumery[46, 58, 61].

dwatta Antiasthmatic Antitussive Expectorant SedativeThe bulb is antiasthmatic, antitussive, expectorant, sedative and tonic (nutritive)[174, 176]. It is used in the treatment of coughs, haemoptysis, insomnia and fidgetiness in the later stage of febrile disease[176].

nrakta E. Asia - Southern Japan, in the Ryukyu Islands. ksacta By the coast, often in pockets of coral rock[143].

propta Seed - immediate epigeal germination[130]. Sow thinly in pots from late winter to early spring in a cold frame. Should germinate in 2 - 4 weeks[163]. Great care should be taken in pricking out the young seedlings, many people prefer to leave them in the seed pot until they die down at the end of their second years growth. This necessitates sowing the seed thinly and using a reasonably fertile sowing medium. The plants will also require regular feeding when in growth. Divide the young bulbs when they are dormant, putting 2 - 3 in each not, and grow them on for at least another year before planting them out into their permanent positions when the plants are dormant[K]. Division with care in the autumn once the leaves have died down. Replant immediately[200]. Bulb scales can be removed from the bulbs in early autumn. If they are kept in a warm dark place in a bag of moist peat, they will produce bulblets. These bulblets can be potted up and grown on in the greenhouse until they are large enough

nwatta Landscape Uses: Container, Specimen, Prefers an open free-draining humus-rich loamy soil with its roots in the shade and its head in the sun[200]. Lime tolerant.[200], plants grow well in limestone soils[260]. Plants deteriorate rapidly if grown in deep shade[143]. A very ornamental plant[1] it is often cultivated for the cut flower trade[260]. It is only hardy outdoors in the mildest areas of Britain and even there needs to be grown in a warm sheltered position with protection from early frosts[143]. The dormant bulbs will withstand soil temperatures down to at least -5°c[214]. It can be grown as an annual, the plants can flower in 6 months from seed[143]. The flowers diffuse a pleasant jasmine-like perfume[245]. Hand pollination is required in order to ensure fertilization[143]. Stem rooting, plant the bulbs 20cm deep[143]. Early to mid autumn is the best time to plant out the bulbs in cool temperate areas, in warmer areas they can be planted out as late as late autumn[200]. The plant should be protected against rabbits and slugs in early spring.

If the shoot tip is eaten out the bulb will not grow in that year and will lose vigour[200]. Special Features: Attractive foliage, Suitable for cut flowers, Fragrant flowers, Attractive flowers or blooms. The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the aboveground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a clumper with limited spread [1-2]. The root pattern is a bulb.

#### 8.2.128 Arctostaphylos tomentosa

Downy Manzanita, Woollyleaf manzanita, Brittleleaf manzanita, Dacite manzanita, Rosy manzanita, San 7 tlin 10 cvuc 3 kcak 3 tcan 3 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta Arctostaphylos tomentosa is an evergreen Shrub growing to 1.5 m (5th). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked[2, 92, 105, 161]. Sweet, dry and mealy[61]. An important food for native tribes, it can also be dried for winter use[177]. When dried and baked into a bread it is relished by the native Indian tribes[2]. If harvested when not quite ripe, it can be used like a tart apple[2]. A cooling sub-acid drink can be made from the fruit[2, 257]. The fruit is about 8 - 10mm in diameter[200]. Seed - ground into a powder and used to make mush, biscuits etc[92, 257]. The seed is very small and would be difficult to separate from the fruit. It would be easier to dry the whole fruit, grind this into a powder and use it in soups etc[K].

tcanta Dye WoodA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168]. The wood is used for making fine furniture[61].

dwatta Antiseptic Appetizer Astringent Diuretic Stomachic UrinaryThe dried leaves are used in the treatment of a variety of complaints[4]. These leaves should be harvested in early autumn, only green leaves being selected, and then dried in gentle heat[4]. A tea made from the dried leaves is strongly astringent, diuretic and an antiseptic for the urinary tract[4, 222]. It is much used for kidney and bladder complaints and inflammation of the urinary tract, but it should be used with caution[4, 21, 46, 172] because it contains arbutin which hydrolyzes into the toxic urinary antiseptic hydroquinone[222]. An infusion of the bark powder has been used in the treatment of lung haemorrhages[257]. A cider made from the fruit has been used as an appetizer to create appetite and treat stomach complaints[257]. Although the report does not specify, the cider was probably unfermented[K]

nrakta South-western N. America - California. ksacta Sandy places[71] on the edge of Pinus radiata forests and on windy coastal bluffs below 150 metres[166].

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10-20 seconds or burn some straw on top of them and then stratify at 2-  $5^{\circ}{\rm c}$  for 2 months[11, 200]. The seed usually germinates in 2-3 months at  $15^{\circ}{\rm c}[134]$ . When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or greenhouse for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5-8cm with a heel, August to December in a frame. The cuttings are very slow and can take a year to root[1, 78]. Division in early spring. Take care

but it inhibits the growth of legumes[18, 20, 54]. This plant is a bad companion for alfalfa, each species negatively affecting the other[201]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.124 Impatiens pallida

Pale Jewelweed, Pale touch-me-not 7 tlin 10 cyuc 3 keak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslin hpa7tmwatli xre7t hionli

drutta Impatiens pallida is a ANNUAL growing to 1.5 m (5ft) by 0.6 m (2ft in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

poista Regular ingestion of large quantities of these plants can be dangerous due to their high mineral content[172]. This report, which seems nonsensical, might refer to calcium oxalate. This mineral is found in I. capensis and so is probably also in other members of the genus. It can be harmful raw but is destroyed by thoroughly cooking or drying the plant[K]. People with a tendency to rheumatism, arthritis, gout, kidney stones and hyperacidity should take especial caution if including this plant in their diet[238].

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves and shoots - cooked[62]. Added to sukiyaki, chow mein and other oriental dishes[183]. When used as a vegetable on their own the cooking water should be changed once or twice during the cooking[183]. Some caution is advised, see the notes on toxicity at the top of the record. Seed[62]. No more details are given but the seeds are difficult to harvest in quantity, mainly because of their exploding seed capsules which scatter the ripe seed at the slightest touch[K].

tcanta FungicideA fungicide is obtained from the plant. It is used to treat skin diseases[62]. There are no more details but it is probably obtained from the fresh juice of the plant and can be concentrated by boiling up the juice.

dwatta Skin StingsThe whole plant is diuretic, emetic and purgative[238]. It is only used externally, the soothing and medicinal sap is a proven remedy for nettle stings and poison ivy rash[62, 207, 222, 238, 257] and is also used in the treatment of warts, corns, ringworm and haemorrhoids[238].

nrakta Eastern N. America - Newfoundland to Saskatchewan, south to Georgia. ksacta Moist woodland and wet meadows, usually on calcareous soils[43].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer.

nwatta Succeeds in any reasonably good soil[1]. Grows well in heavy clay soils. Prefers a moist well-drained humus rich soil in a cool site[200]. The plant is hardy to about -5°c[238]. It should be possible to grow it as a spring-sown annual in most parts of Britain. This plant has seed capsules that spring open forcibly as the seed ripens to eject the seed a considerable distance. The capsules are sensitive to touch even before the seed is ripe, making seed collection difficult but fun[K].

#### 8.2.125 Lavatera thuringiaca

Lavatera. Tree lavatera

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 1.8 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lavatera thuringiaca is a PERENNIAL growing to 1.8 m (6ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers LeavesEdible Uses: Young leaves - raw or cooked. A mild flavour, but the leaves are tough and not very worthwhile[K]. Leaves of the cultivar 'Barnsley' are less tough and are reasonably tasty, a plant at Kew had also produced quite a few leaves in the winter and so it is a potential winter salad[K]. Flowers - raw. A pleasant mild flavour, they make a decorative addition to the salad bowl[K]. Many named cultivars have considerably larger flowers than the type species and are thus much more worthwhile for the salad bowl[K].

tcanta FibreA strong fibre is obtained from the stems, it is used for making string, bags, paper etc[74].

nrakta S.E. Europe to W. Asia - Armenia to Caucasia. ksacta Hills, thickets and waysides[100], by streams to 2800 metres[93]

propta Seed - sow spring in a cold frame and only just cover the seed[200]. Germination is usually quick and good. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer[K]. Basal cuttings in spring. Cuttings of softwood in June/July[188].

nwatta An easily grown plant, succeeding in any ordinary garden soil[1]. Prefers a light well-drained moderately fertile soil in full sun[200]. A soil that is too rich encourages foliar growth at the expense of flowering[200]. Tolerates maritime exposure[200]. Plants are hardy to about -20°c[187]. There are many named forms selected for their ornamental value[200]. The cultivar 'Barnsley' usually produces new shoots from the base in the autumn and winter. It is therefore a potential winter salad plant, though the texture of the leaves is not that wonderful[K].

#### 8.2.126 Lycium carolinianum

Christmas Berry, Carolina desert-thorn 7 tlin 10 cyuc 3 kcak 3 tcan 2 dwat 1.5 m hkuc htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Lycium carolinianum is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure

pcista Although no records of toxicity have been seen for this species, it does belong to a family that contains many poisonous plants. Some caution should be applied, especially towards leaves or unripe fruits, though ripe fruits are almost certainly edible.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Rather pleasant eating, the fruit has a slightly salty taste[183]. The fruit is a berry up to 12mm in diameter[200]. Only the fully ripe fruits should be eaten[Kl.

tcanta Soil stabilizationPlants have an extensive root system and can be planted to stabilize banks[200].

dwatta CancerThe fruit of many members of this genus is a very rich source of vitamins and minerals, especially in vitamins A, C and E, flavanoids and other bio-active compounds. It is also a fairly good source of essential fatty acids, which is fairly unusual for a fruit. It is being investigated as a food that is capable of reducing the incidence of cancer and also as a means of halting or reversing the growth of cancers [214].

nrakta South-eastern N. America - S. Carolina to Florida and Texas. ksacta Not known

propta Seed - sow early spring in a greenhouse. Germination is usually good and fairly quick. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Pinch out the shoot tips of the young plants in order to encourage bushy growth[78]. Cuttings of half-ripe wood, 5 - 10cm with a heel if possible, July/August in individual pots in a frame. Good percentage[78]. Cuttings of mature wood of the current season's growth, autumn to late winter in a cold frame. High percentage[78, 2001. Division of suckers in late winter. Very

(loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots -cooked[195]. They are usually boiled in at least one change of water. The shoots, which are 3 - 4cm in diameter[266], are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta WoodThe canes are split into splints and used for weaving wares and are also used whole as handles of farm tools and appliances[266].

nrakta E. Asia - China, ksacta Not known

propta Seed. - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position and plenty of moisture in the growing season. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It dislikes prolonged exposure to hard frosts. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. Closely related to P. meyeri[195].

#### 8.2.76 Phyllostachys arcana

Half-Black Bamboo

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phyllostachys arcana is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is polinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots cooked[195]. The shoots, which are about 3cm in diameter[266], are harvested in the spring when about 8cm above the ground, cutting them about 5cm below soil level. They are said to be of good quality[183] and have a delicious flavour[266].

tcanta WoodThe hard canes are used as handles of farm appliances or as pillars of bamboo appliances[195, 266]. They are also used for matting and making lanterns[195].

nrakta E. Asia - China. ksacta Not known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from

established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Prefers a rich damp soil with shelter from cold harsh winds and prolonged frosts. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

#### 8.2.77 Smilax laurifolia

Laurel Greenbrier

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Smilax laurifolia is an evergreen Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root -cooked[2, 102, 161, 177]. Rich in starch[46, 105], it can be dried and ground into a powder to be used as a flavouring in soups etc or for making bread[257]. The root can be up to 15cm thick[235]. Young shoots - cooked. Used as an asparagus substitute[2, 46, 102, 161].

dwatta Astringent Birthing aid Poultice Rubefacient TonicThe stem prickles have been rubbed on the skin as a counter-irritant to relieve localised pains, muscle cramps and twitching[222]. A tea made from the leaves and stems has been used in the treatment of rheumatism and stomach problems[222]. The wilted leaves are applied as a poultice to boils[222]. A tea made from the roots is used to help the expelling of afterbirth[222]. Reports that the roots contain the hormone testosterone have not been confirmed, they might contain steroid precursors, however[222]. The root bark is astringent and slightly tonic[257]. An infusion of the root bark has been used as a wash in treating burns, sores and pox[257].

nrakta South-eastern N. America - New Jersey to Florida and Texas. ksacta Swamps and low ground[43]. Moist woods and thickets[235]. Bays, bogs, pocosins, swamp margins, marshy banks[270].

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus. seeds of plants from cooler areas seem to require a period of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwatta Succeeds in most soils in sun or semi-shade[200]. This species is not very hardy in Britain[1]. It succeeds outdoors in S.W. England, but even there it is best when grown against a wall[11]. The fruit takes two growing seasons to

Male and female plants must be grown if seed is required.

#### 8.2.78 Himalayacalamus falconeri

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Himalavacalamus falconeri is an evergreen Bamboo growing to 6 m (19ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots cooked and used as a vegetable[220, 272]. The young shoots are widely collected in Nepal and Bhutan, though this often conflicts with the other main use of the plant as a material for weaving[220, 267].

tcanta Basketry WeavingThe canes are thin walled, very light and pliable, they are used for basket making and other woven structures[195, 272]. The plant is frequently harvested from the wild for this purpose[220].

nrakta E. Asia - Himalayas. ksacta Cool broad-leaved forests, 2000 - 2500 metres[220].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings. Rhizome cuttings.

nwatta Prefers a humus rich friable sandy loam in a sunny position or in shade [200]. Intolerant of winter wet and of temperatures below about -6°c[200]. According to some authorities, the correct name for this species should be Himalayacalamus falconeri[220]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. Usually only about 3 metres tall in Britain, plants can reach 10 metres in height in favoured areas. The rootstock is caespitose.

# 8.2.79 Passiflora incarnata

Maypops - Passion Flower, Purple passionflower, Apricot Vine, Maypop, Wild Passion Flower, Purple Pa 7 tlin 11 cyuc 3 kcak 0 tcan 3 dwat 6 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Passiflora incarnata is an evergreen Climber growing to 6 m (19ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from June to July, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Sedation. Hypersensitivity reactions noted. Can potentiate the action of central nervous system depressants like alcohol [301].

kcakta Edible Parts: Flowers Fruit LeavesEdible Uses: Fruit - raw or cooked in jellies, jams etc[2, 3, 21, 46, 61]183].

ripen[235]. The stems have viscious thorns[270]. Dioecious. A sweet flavour[4], it is best when used as a ielly[95]. High in niacin[160]. Fairly large, the fruit is up to 5cm in diameter[200] though it contains relatively little edible pulp and a lot of seeds[K]. Leaves - raw or cooked. Said to be delicious as a cooked vegetable or when eaten in salads[183]. Flowers cooked as a vegetable or made into syrup[183].

> dwatta Antidepressant Antispasmodic Astringent Diaphoretic Epilepsy Homeopathy Hypnotic Narcotic Sedative Vasodilator Women's complaintsMaypops is a valuable sedative and tranquillising herb with a long history of use in North America[254]. It is frequently used in the treatment of insomnia, epilepsy, hysteria etc[254]. The leaves and stems are antispasmodic, astringent, diaphoretic, hypnotic, narcotic, sedative, vasodilator and are also used in the treatment of women's complaints[4, 7, 21, 46, 61, 165, 192, 207, 2381. The plant is harvested after some of the berries have matured and is then dried for later use[4]. It is used in the treatment of insomnia, nervous tension, irritability, neuralgia, irritable bowel syndrome, pre-menstrual tension and vaginal discharges[4, 21, 165, 192, 207]. An extract of the plant depresses the motor nerves of the spinal cord[213], it is also slightly sedative, slightly reduces blood pressure and increases respiratory rate[222]. The plant contains alkaloids and flavonoids that are an effective non-addictive sedative that does not cause drowsiness[238]. The plant is not recommended for use during pregnancy[238]. A poultice of the roots is applied to boils, cuts, earaches, inflammation etc[222]. The dried plant is exported from America to Europe for medicinal usage[207]. A homeopathic remedy is made from the plant[4]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Passiflora incarnata for nervousness and insomnia (see [302] for critics of commission E).

> nrakta Eastern N. America - Virginia and Kentucky. south to Florida and Texas. ksacta Sandy thickets and open soils[43]. Fields, roadsides, fence rows and thickets[192].

> propta Pre-soak the seed for 12 hours in warm water and then sow late winter or early spring in a warm greenhouse. If sown in January and grown on fast it can flower and fruit in its first year[88]. The seed germinates in 1 - 12 months at 20°c. Prick out the seedlings into individual pots when they are large enough to handle. It you are intending to grow the plants outdoors, it is probably best to keep them in the greenhouse for their first winter and plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Mulch the roots well in late autumn to protect them from the cold. Cuttings of young shoots, 15cm with a heel, in spring[1]. Leaf bud cuttings in spring. Cuttings of fully mature wood in early summer. Takes 3 months. High percentage[3].

> nwatta Landscape Uses: Arbor, Container, Seashore, Reguires a well-drained soil with plenty of moisture in the growing season, otherwise it is not fussy[1]. Another report says that it prefers a well-drained sandy slightly acid soil in full sun[238]. In a well-drained soil the roots are hardy to about -20°c, although top growth is killed back by frost[160, 200]. The top growth is cut back almost to the ground each year by some people and the plant treated as a herbaceous perennial[88]. The roots should be mulched in winter to prevent them from freezing. Plants thrive in a short growing season[160]. A climbing plant, supporting itself by means of tendrils[222]. Resistant to pests and diseases[160]. Plants in this genus are notably resistant to honey fungus[200]. Cultivated for its edible fruit by the North American Indians[2, 46]. Plants yield from 5 to 20 fruits annually in the wild[160]. Outdoor grown plants should have their roots restricted in order to encourage fruit production instead of excessive vegetative growth[1]. Hand pollinate using pollen from a flower that has been open for 12 hours to pollinate a newly opened flower before midday[88]. Special Features: North American native. Attracts butterflies. Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. Herbaceous. A suckering vine sending up suckers some distance main plant [1-2]. The root pattern is stoloniferous rooting from creeping stems above the ground [1-2].

especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit is about 6mm in diameter[200].

tcanta DyeA green dye is obtained from the roots[168]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168].

dwatta Antibacterial Antirheumatic Antitumor Dysentery Febrifuge Laxative Salve TonicThe bark is antirheumatic and febrifuge[257]. A decoction has been taken internally in the treatment of rheumatism, aque, consumption and heartburn[257]. A decoction has been used as a wash for cuts and bruises[257]. The liquid obtained from chewing the roots has been used as a salve and to prevent swelling from wounds and abrasions[257]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta South-western N. America - California, Mexico. ksacta Rocky exposed places and woody slopes below 1200 metres[71].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Landscape Uses:Border, Foundation, Ground cover, Massing. An easily grown plant, it thrives in any good garden soil[11, 200]. Grows well in heavy clay soils. Dislikes windy positions[49]. Prefers a shady sheltered position[49]. This species is not fully hardy in the colder parts of Britain[3]. The young growth in spring can be damaged by late frosts. Closely allied to M. aquifolium[67]. It hybridizes freely with other members of the genus. Most plants grown in gardens under this name are in fact hybrids[182]. Plants are resistant to honey fungus[88]. Special Features: North American native, Fragrant flowers, Attractive flowers or blooms.

# 8.2.122 Asphodelus aestivus

7 tlin 10 cvuc 3 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asphodelus aestivus is an evergreen Perennial growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Root Seed StemEdible Uses: Tuber - cooked[4]. Rich in starch[89, 177]. Dried and boiled in water it yields a mucilaginous matter which can be mixed with grain to make a nutritious bread[4, 105]. Boiling destroys the acrid principle in the tubers[4], rendering them quite pleasant to eat[K]. Flowering stalk - cooked[89, 148]. Seed - roasted[89, 148].

tcanta Adhesive DyeThe dried tuber is pulverized and mixed with cold water to make a strong glue[4] that is used by bookmakers and shoemakers[61, 89, 148]. A yellow dye is obtained from the tuber[46, 61].

dwatta Acrid Antispasmodic Diuretic EmmenagogueThe root, gathered at the end of its first year, is acrid, antispasmodic, diuretic, emmenagogue[4]. It was used in the treatment of several diseases by the Greeks and Romans, but is not employed in modern medicine[4].

nrakta S. Europe, N. Africa, W. Asia, ksacta Rocky places, hills, dry places[89] and on poor uncultivated ground[42].

propta Seed - sow March/April in a greenhouse and only just cover the seed. Germination usually takes place in 1 - 3 months at 15°c[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When the plants are large enough to handle, plant them out into their permanent positions in late spring or early summer. Division in early spring or autumn[111].

nwatta Succeeds in ordinary garden soil, tolerating partial shade[200]. Requires a well-drained soil[1, 200]. Prefers a deep rich sandy loamy soil[1, 111]. Prefers a sunny position and a soil that is not too rich[200]. Grows well on hot dry banks[42]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants are evergreen in mild winters[200]. Plants seem to be immune to the predations of rabbits[233]. This species is closely related to A. ramosus[187].

## 8.2.123 Allium atropurpureum

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli hgattcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Allium atropurpureum is a BULB growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate

pcista Although no individual reports regarding this species have been seen, there have been cases of poisoning caused by the consumption, in large quantities and by some mammals, of certain members of this genus. Dogs seem to be particularly susceptible[76].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - raw or cooked. The bulbs are 15 - 30mm wide[200]. Leaves - raw or cooked. Flowers - raw. Used as a garnish on

tcanta RepellentThe juice of the plant is used as a moth repellent. The whole plant is said to repel insects and moles[20]

dwatta Although no specific mention of medicinal uses has been seen for this species, members of this genus are in general very healthy additions to the diet. They contain sulphur compounds (which give them their onion flavour) and when added to the diet on a regular basis they help reduce blood cholesterol levels, act as a tonic to the digestive system and also tonify the circulatory system[K].

nrakta E. Asia - N. India. ksacta Shaded humus rich soils along rocky cliffs, 1900 metres to 2200 metres in the Himalayas[145].

propta Seed - sow spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle - if you want to produce clumps more quickly then put three plants in each pot. Grow them on in the greenhouse for at least their first winter and plant them out into their permanent positions in spring once they are growing vigorously and are large enough. Division in spring. The plants divide successfully at any time in the growing season, pot up the divisions in a cold frame or greenhouse until they are growing well and then plant them out into their permanent positions.

nwatta Prefers a sunny position in a light well-drained soil[1]. Established plants are fairly drought tolerant[190]. Judging by its habit, this plant should also tolerate some shade[K]. This species is only hardy in the milder areas of the country, it should tolerate temperatures down to between -5 and -10°c. The bulbs should be planted fairly deeply[1]. Most members of this genus are intolerant of competition from other growing plants[203]. Grows well with most plants, especially roses, carrots, beet and chamomile,

obtained from this plant is probably the foulest-smelling of all herbs, with a sulphurous garlic-like odour[7, 238]. It is so nauseating to some people that it has been nicknamed 'dung of the devil'[7]. However, in judicious quantities it gives a surprisingly pleasant flavour to many foods[238].

tcanta Essential GumA gum-resin is obtained from incisions in the roots and rhizomes[114]. The stem is removed at the end of the growing season, the root uncovered and a thin slice removed[74]. Another report says that the stem is removed as the plant starts to flower[238]. The gum exudes and hardens and a fresh slice is then made[74]. The gum should be stored in an air-tight container to prevent its strong flavour contaminating nearby substances[238]. The gum is a source of an essential oil which has medicinal properties and is also used as a food flavouring and in perfumery[46,

dwatta Antiasthmatic Antispasmodic Carminative Expectorant Laxative SedativeAsafoetida is a very effective medicinal herb that acts mainly on the digestive system, cleansing and strengthening the gastro-intestinal tract[238]. It is much used in the Ayurvedic tradition[238]. The gumresin contains a volatile oil that is as persistent in aroma as garlic. They leave the body via the respiratory system and aid the coughing up of congested mucous[254]. The pungently flavoured gum-resin that is obtained from the root is alterative, anthelmintic, antiperiodic, antispasmodic, carminative, deobstruent, deodorant, expectorant, laxative, sedative and stomachic[7, 21, 176, 218]. It is used in the treatment of simple digestive problems such as wind, bloating, indigestion and constipation, and also for respiratory problems such as bronchitis, bronchial asthma and whooping cough[254]. It is also used as a circulatory stimulant, lowering blood pressure and thinning the blood[7, 21, 165, 176, 254]. The resin has a synergistic effect on other herbal preparations such as camphor, valerian and nux-vomica[7]. It is used in tincture as a mild cardio-tonic[7]. As an aphrodisiac [301]. See below under 'Uses notes' for details on harvesting the resin.

nrakta W. Asia - Afghanistan to Iran, ksacta Deserts[74]. propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their permanent positions whilst still small because the plants dislike root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root disturbance

nwatta Succeeds in most soils[1]. Prefers a deep fertile soil in a sunny position[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants have a long taproot and are intolerant of root disturbance[200]. They should be planted into their final positions as soon as possible. Monocarpic, the plant takes some years before it flowers and dies after flowering[74]. In Britain, the plants usually flower after about 5 years[238]. The whole plant, especially when bruised, has an unpleasant smell like stale fish[245].

#### **8.2.119** Rubus almus

Mayes Dewberry, Garden dewberry

7 tlin 10 cvuc 3 kcak 1 tcan 0 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rubus almus is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Good quality[177]. A dewberry, it is very juicy[71]. The oblong fruit is about 30mm long[200].

tcanta DyeA purple to dull blue dye is obtained from the

nrakta Southern N. America - north-eastern Texas, ksacta Not known

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one

month stratification at about 3°c and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Tip layering in July. Plant out in autumn. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. Plants in this genus are notably susceptible to honey fungus[200].

#### 8.2.120 Asparagus acutifolius

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 1.5 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nvanhien hionli

drutta Asparagus acutifolius is an evergreen Perennial growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime

kcakta Edible Parts: StemEdible Uses: Young shoots cooked[22, 46, 61]. An asparagus substitute, it is preferred by gourmets for its stronger flavour[132, 183]. Excellent when seasoned with oil and lemon juice[183]. Thin, bitter and often stringy according to another report[2]. Very aromatic[132]. A uniquely bitter aromatic flavour[183]. The new shoots are rather thin and are not produced in abun-

nrakta Europe - Mediterranean. ksacta Bushy and dry sunny places, mainly on limestone[45, 89, 132].

propta Seed - pre-soak for 12 hours in warm water and then sow in spring or as soon as the seed is ripe in early autumn in a greenhouse. It usually germinates in 3 - 6 weeks at 25°c[134]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a sunny position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Division in early spring as the plant comes into

nwatta An easily grown plant, succeeding in any good garden soil[200]. Prefers a rich sandy loam[1]. Plants tolerate considerable neglect on our Cornish trial grounds[K]. Plants are very tolerant of maritime exposure[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frosttender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Dioecious. Male and female plants must be grown if seed is required.

# 8.2.121 Mahonia pinnata

California Barberry, Wavyleaf barberry, Island barberry, Creeping Holly Grape

7 tlin 8 cyuc 3 kcak 2 tcan 2 dwat 1.8 m hkuc

1348

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Mahonia pinnata is an evergreen Shrub growing to 1.8 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 3, 105, 161]. An acid flavour but rather nice raw,

#### 8.2.80 Arbutus andrachne

Grecian StrawberryTree

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 6 m hkuc

htut cyutli hgatkyuctcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Arbutus andrachne is an evergreen Tree growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from March to April, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 22, 46, 105, 183, K]. A luscious, juicy texture with a sweet but insipid flavour[K]. Many people do not like eating more than a few of the raw fruits, though I find them very acceptable[K]. They make a good cooked fruit in preserves etc[K]. The fruit is about 15mm in diameter[200].

tcanta Hedge Hedge WoodPlants can be grown as a hedge, they are tolerant of some trimming[188]. Wood - hard, close-grained.

nrakta S.E. Europe. W. Asia. ksacta Evergreen scrub and rocky slopes[45] on limestone, serpentine and igneous rocks in areas that are very dry in summer[184].

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse [78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at 20°c[134]. Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. Basal cuttings in late winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of young wood - can take 2 years[1, 200].

nwatta Requires a nutrient-rich well-drained moistureretentive soil in a sunny position with shelter from cold drying winds, especially when young[200]. Requires a lime-free soil according to some reports[1, 134], but it thrives on a limy soil according to other reports[11, 182, 200]. Established plants are drought tolerant. Plants are hardy to about -15°c[184]. The flowers are sweetly scented[245]. Dislikes being transplanted, it should be placed in its final position whilst young, giving some protection in its first winter outdoors[11, 134]. Plants are very slow growing. Most plants cultivated under this name are in fact A. x andrachnoides 'Serratula'[200].

#### 8.2.81 Schisandra henryi

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 6 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Schisandra henryi is a deciduous Climber growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[11, 177].

nrakta E. Asia - China from W. Hupeh to Szechwan. ksacta Thickets, in rich forests and woodland[109]. Forests, ravines, slopes and thickets at elevations of 500 - 2500 me-

propta Seed - best sown in the autumn in a cold frame[200, 238]. Pre-soak stored seed for 12 hours in warm

1333

water and sow in a greenhouse in the spring[238]. Germination can be slow and erratic. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for their first 2 years. Plant them out into their permanent positions in early summer. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame. Overwinter in the greenhouse and plant out in late spring[11, 78]. Good percentage[78]. Layering of long shoots in the autumn[200].

nwatta Prefers a rich well-drained moisture retentive soil[11, 200]. Prefers a slightly acid soil but tolerates some alkalinity if plenty of organic matter is added to the soil[200]. Requires some protection from the most intense sunlight[200]. Plants succeed in guite deep shade and are suitable for north-facing walls[219]. Plants are intolerant of drought[K]. Plants are not very cold-hardy in Britain, tolerating temperatures down to about -7°c[200]. They succeed outdoors in the milder areas of the country, especially if given the protection of woodland or a wall[K]. The young growth in spring can be damaged by late frosts. A very ornamental plant[1], it climbs by twining around supports[188]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.82 Muehlenbeckia complexa

Maidenhair Vine

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Muehlenbeckia complexa is a deciduous Climber growing to 5 m (16ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Sweet and juicy[173]. Botanically speaking it is actually the swollen flowers that are eaten![K].

tcanta Hedge HedgeVery salt and wind hardy, it is an excellent plant for clothing wire netting fences in very exposed positions, making a good windbreak hedge[29]. It responds well to trimming and can be grown as a free-standing shrub or hedge[260]. The plant makes an excellent ground cover when it is grown in a sunny position[K].

nrakta New Zealand. ksacta Coastal, lowland and lower montane forests, especially marginal, also in open and rocky places in North South and Stewart Islands[44].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8 cm with a heel, July/August in a frame. Pot up in autumn and overwinter in a cold frame. High percentage[78]. Plant out in late spring. Cuttings of mature wood of the current season's growth, 5 -10cm with a heel. October/November in a cold frame. High percentage[78].

nwatta Requires a well-drained soil in sun or semishade[200]. Very tolerant of maritime exposure[29]. This species is hardy to about -5°c[260]. It does not withstand hard frosts, growing very well in south-western Britain but being killed back to the ground by severe frosts at Kew and further north[11, 219]. A climbing plant that supports itself by twining around other plants etc[219], though it can also support itself and grow more like a shrub[260].. Polymorphic, there are many sub-species[44]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.83 Illicium verum

Ba Jiao Hui Xian, Staranise tree

7 tlin 10 cyuc 3 kcak 0 tcan 3 dwat 5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Illicium verum is an evergreen Tree growing to 5 m (16ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from March to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The fruit is poisonous in quantity[19, 177].

kcakta Edible Parts: FruitEdible Uses: The fruit is used as a flavouring in curries, teas and pickles[2, 132, 177, 238]. It is an ingredient of 'five spice powder', used in Chinese and Vietnamese cuisine[238]. The fruit is also chewed after meals in order to sweeten the breath[4]. Caution is advised because it is said to be poisonous in quantity[19, 177]. The essential oil is used to flavour liqueurs, soft drinks and bakery products[238].

tcanta Essential IncenseThe pounded bark is used as an incense[4].

dwatta Antibacterial Appetizer Carminative Expectorant Homeopathy StimulantThe fruit is antibacterial, carminative, diuretic, odontalgic, stimulant, and stomachic[4, 21, 61, 176, 240]. It is taken internally in the treatment of abdominal pain, digestive disturbances and complaints such as lumbago 176, 238]. It is often included in remedies for digestive disturbances and cough mixtures, in part at least for its pleasant aniseed flavour[238]. An effective remedy for various digestive upsets, including colic, it can be safely given to children[254]. The fruit is also often chewed in small quantities after meals in order to promote digestion and to sweeten the breath[4, 238]. The fruit has an antibacterial affect similar to penicillin[176]. The fruit is harvested unripe when used for chewing, the ripe fruits being used to extract essential oil and are dried for use in decoctions and powders[238]. A homeopathic remedy is prepared from the seed[4].

nrakta E. Asia - China, Vietnam. ksacta Light woodland and thickets[200]. Forests at elevations of 200 - 1600 metres in S and W Guangxi Province, China[266].

propta Seed it does not require pre-treatment and can be sown in early spring in a greenhouse[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold over the winter for the first year or two. Layering in early spring. Takes 18 months[78]. Cuttings of half-ripe wood, August in a frame[113]. Pot up the cuttings when they start to root and grow them on in the greenhouse for their first winter, planting out after the last expected frosts.

nwatta Prefers a light, moist well-drained loam and a sheltered position[1, 11] Prefers a humus-rich lime-free soil[182, 200]. Succeeds in sun or semi-shade[200]. This species is not very cold-hardy, it tolerates temperatures down to between -5 and -10°c and requires a very sheltered position or the protection of a wall when grown in Britain[200]. Chinese anise is extensively cultivated in China for its fruit and medicinal essential oil[200]. It is planted in the grounds of temples in Japan, and also on tombs[4]. Plants seldom grow larger than about 3 metres in Britain, but eventually reach about 18 metres tall in their native habitat[200].

# 8.2.84 Phyllostachys angusta

Stone Bamboo

7 tlin 10 cyuc 3 kcak 2 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys angusta is an evergreen Bamboo growing to 5 m (16ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can

grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Shoots StemEdible Uses: Young shoots in spring - cooked. The shoots, which are 3 - 4cm in diameter[266], are harvested when about 8cm above the ground, cutting them about 5cm below soil level. They are usually boiled and are free from bitterness[195].

tcanta WoodCanes are very hard and are used in making fine furniture[195]. The tough splints from culms are good for weaving fine bamboo articles[266].

nrakta E. Asia - China. ksacta Not known

propta Seed - surface sow as soon as it is ripe in a greenhouse at about  $20^{\circ}\mathrm{c}$ . Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3-6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Prefers a rich damp soil in a sheltered position and some shade[200]. Grows well in a woodland. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Closely related to P. flexuosa[200, 266]. This is a good companion species to grow in a woodland because the plants have shallow root systems that do not compete with deep tree roots[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

# 8.2.85 Drimys lanceolata

Mountain Pepper

7 tlin 10 cyuc 3 kcak 4 tcan 1 dwat 4.5 m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhien hionli

drutta Drimys lanceolata is an evergreen Shrub growing to 4.5 m (14ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil. The plant can tolerates strong winds but not maritime exoosure.

kcakta Edible Parts: Fruit SeedEdible Uses: Condiment-The fruit and seed are used as a pepper and allspice substitute[1, 2, 11, 46, 61, 105, 183]. A pungent flavour[183, 193]. The aromatic berries are edible according to one report[238], whilst another says that they taste somewhat like cinnamon.

tcanta Hedge Hedge WoodThis species makes an excellent windbreak in woodland, it is widely grown as a hedge in mild temperate regions[238]. Wood - soft, only moderate strength[154].

dwatta Antiscorbutic StomachicAntiscorbutic, stomachic[152].

nrakta Australia - New South Wales, Tasmania and Victoria. ksacta Moist places in mountain forests and also in alpine zones to 1500 metres[152].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe

and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3]. The red fruit has an acid lemony flavour with a firm but juicy texture, it is rather nice raw, especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit can be up to about 6mm in diameter[200], though on specimens we have seen fruiting in Britain the fruit is only 3mm in diameter[K].

tcanta DyeA green dye is obtained from the roots[168]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168]. A green dye is obtained from the leaves[168].

dwatta Antibacterial Antitumor Dysentery TonicBerberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta South-western N. America - S. California. ksacta Sandy and gravelly places in sage bush scrub or chaparral[71, 184].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Unlike most members of the genus, this species requires a dry, perfectly drained position in full sun[184], a gritty slightly acid soil is best[200]. It does well in a hot, dry position[166]. Succeeds in a good garden soil[11]. It grows best by a sunny south-facing wall[182]. Plants are not fully hardy in all parts of Britain, they probably tolerate temperatures down to about -10°c when fully dormant[184], though the young growth in spring can be damaged by late frosts. This species is closely allied to M. haematocarpa and M. fremontii[182]. It hybridizes freely with other members of the genus. Grows and flowers well at the University Botanical Gardens in Oxford[67]. A plant on a south-facing wall at Kew produced a good crop of fruit in 1999[K]. Plants are resistant to honey fungus[88].

#### 8.2.117 Ouercus fruticosa

7 tlin 10 cyuc 3 kcak 2 tcan 2 dwat 2 m hkuc htut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus fruticosa is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[105, 177]. The seed is about 15mm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds,

one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[200]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta S.W. Europe. ksacta Sandy places in lowland and mountains.

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly. Division of suckers in the dormant season.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Prefers warmer summers than are usually experienced in Britain, but plants usually grow well in Britain[200]. Produces suckers[200]. Plants are often very low growing, to about 30cm tall, and spread out to form a carpet[200]. The seed ripens in its first vear[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a nonsuckering single trunk [1-2].

#### 8.2.118 Ferula foetida

Asafoetida - Devil's Dung. Hing (Indian), Asafetida 7 tlin 10 cyuc 3 keak 0 tcan 3 dwat 2 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fvifxre7t hionli

drutta Férula foetida is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Do not use orally. Avoid during pregnancy as possible increased bleeding. Topical use may cause skin irritation [301].

kcakta Edible Parts: LeavesEdible Uses: Condiment GumLeaves and young shoots - cooked as a vegetable[2, 4, 177, 183]. The plant has a foetid odour, but this disappears when it is boiled[2]. The cabbage-like folded heads are eaten raw as a delicacy[183]. Root - cooked[2, 4]. It needs to be steeped in order to remove a bitterness[74]. A starch extracted from the roots is used to make a porridge[74]. A gum-resin from the root is used as a food flavouring[171]. It is an essential ingredient of Worcester sauce, it is also used to flavour a wide range of dishes and drinks[183]. It is popular in natural food cuisine as a garlic substitute[183]. The resin

nwatta Unlike most members of the genus, this species requires a dry, perfectly drained position in full sun, a gritty slightly acid soil is best[200]. It does well in a hot, dry position[200] and grows best on a sunny south facing wall[11]. It requires as sunny a position as possible[11, 200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This plant has been recommended for improvement by selection and breeding as an edible fruit[183]. Closely related to M. haematocarpa, differing mainly in having broadly ovate bracts up to 8mm long[11]. It is also closely related to M. nevinii[200].

#### 8.2.114 Mahonia fremontii

Mahonia Fremont's mahonia

7 tlin 10 cyuc 3 kcak 2 tcan 2 dwat 2.5 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mahonia fremontii is an evergreen Shrub growing to 2.5 m (8ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is poliniated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[257]. It is usually cooked[177]. An acid flavour but it is rather nice raw, especially when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. A beverage has been made from the fruit[257]. The ovoid fruit is about 15mm long[200].

tcanta DyeA yellow dye has been obtained from the roots[257]. A purple dye has been obtained from the fruit[257].

dwatta Antibacterial Antitumor Bitter Dysentery Hepatic Laxative TonicThe plant has been used as an aid for the gums[257]. The roots are bitter tonic, hepatic and laxative[257]. An infusion has been used to promote digestion[257]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta South-western N. America. ksacta Dry rocky places, especially in piñon-juniper woods, often in gravelly soils, 900 - 1500 metres in California[67, 71].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Ğreen' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Unlike most members of this genus, this species requires a dry, perfectly drained position in full sun, a gritty slightly acid soil is best[11, 200]. It grows best on a sunny south facing wall in Britain[11] and does well in a hot, dry position[184]. It requires a position sheltered from strong or cold winds[202]. Plants are only hardy in the milder areas of the country, tolerating temperatures down to about -10°c[184]. Plants are slow-growing[202]. Hybridizes freely with other members of this genus[200]. The flowers are refreshingly fragrant[245]. Some named forms have been developed for their ornamental value[182]. This species is of-

ten confused with M. trifoliolata, which differs in only ever having 3 leaflets per leaf[200].

#### 8.2.115 Mahonia fortunei

Fortune's Mahoni

7 tlin 9 cyuc 3 kcak 0 tcan 2 dwat 2 m hkuc pcimhmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Mahonia fortunei is an evergreen Shrub growing to 2 m (6ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from October to December. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Fruit - raw or cooked. An acid flavour, but it makes an acceptable dessert fruit and is especially nice when added to muesli or porridge[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K].

dwatta Antibacterial Antitumor Cancer Dysentery Febrifuge Odontalgic TonicThe leaf is anticancer[218]. A decoction of the root is febrifuge and odontalgic[218]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta E. Asia - China. ksacta Not known

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Landscape Uses:Border, Container, Foundation, Pest tolerant, Massing, Specimen, Woodland garden. An easily grown shrub, it thrives in any good garden soil[11] including heavy clays. Prefers a semi-shaded woodland position in a damp, slightly acid to neutral humus-rich soil[200]. Plants are not very hardy in Britain, they do not succeed at Kew Gardens, but grow well in milder areas[11]. The young growth in spring can be damaged by late frosts. Plants are very tolerant of pruning and can be cut right back into old wood if they have outgrown their welcome[182]. Hybridizes freely with other members of this genus. The flowers are very sweetly scented[184]. Due to their habit of flowering in late autumn, fruits are rarely formed in Britain[11]. Special Features:Not North American native, Attractive flowers or blooms.

#### 8.2.116 Mahonia nevinii

Nevin's barberry

7 tlin 10 cyuc 3 kcak 2 tcan 2 dwat 2.4 m hkuc htut cyutli kyuctcup hwicli hrasilutnyik hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli

drutta Mahonia nevinii is an evergreen Shrub growing to 2.4 m (7ft 10in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils

wood, 10 - 15 cm with a heel, July/August in a frame. Approximately 60% take[78]. Layering in March/April. Takes 12 months[78]. Cuttings of mature wood of the current year's growth with a heel of older wood, November in a cold frame[78].

nwatta Requires a light lime-free soil in semi-shade[200]. Prefers a fertile moist but well-drained soil[188]. A fairly hardy species, surviving very cold winters in various parts of the country so long as it is in a suitable position[120]. It tolerates temperatures down to about -15°c[184], but plants are liable to be damaged in cold winters. This species is hardier than D. winteri according to one report[120] whilst another says that it is less hardy than D. winteri[200]. All parts of the plant are very aromatic and pungent[182, 184]. Plants in this genus are notably resistant to honey fungus[200]. Plants are usually dioecious though monoecious and hermaphrodite forms are known. Male and female plants must usually be grown if seed is required.

# 8.2.86 Abutilon ochsenii

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Abutilon ochsenii is a deciduous Shrub growing to 4 m (13ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers raw[K]. The flowers are up to 5cm in diameter[219], they have a mild, slightly sweet flavour and a slightly mucilaginous texture[K].

nrakta S. America - Chile. ksacta Not known

propta Seed - sow spring in a greenhouse[200]. Germination should take place within a few weeks. Once the seedlings are large enough to handle, prick them out into individual pots. Grow them on for at least the first winter in a greenhouse and plant out in late spring or early summer, after the last expected frosts. Cuttings of young shoots, June in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts.

nwatta Requires a sunny position or part day shade in a fertile well-drained soil[200]. Dislikes drought[200]. This species is only hardy in the mildest areas of Britain, tolerating temperatures down to between -5 to -10°c when given the protection of a south or south-west facing wall[11, 184, 2001. Plants are often deciduous in cold winters[219]. A deep mulch in winter and tying in growth to the wall will maximise protection in winter[200]. If the plant is cut back by cold weather, it will normally resprout from the base in the spring and can flower on the current year's growth[202]. Plants tend to be short-lived in Britain, dying suddenly without any apparent cause. This is probably because they flower so profusely that they die of exhaustion[11]. They produce an abundance of fertile seed, however, and this normally breeds true to type, though it will hybridise with the closely related A. vitifolium if this species is nearby[11]. Dead-heading plants to prevent seeding can enhance longevity[200]. This species is closely related to A. vitifolium[11]. Tip-prune young plants to promote a bushy habit, older plants can be cut back hard annually in spring if required[200]. Plants in this genus are notably resistant to honey fungus[200].

# 8.2.87 Canna edulis

Achira, Indian shot

7 tlin 10 cyuc 3 kcak 3 tcan 0 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Canna edulis is a PERENNIAL growing to 3 m (9ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to October, and the seeds ripen in October. The species

is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Leaves Root SeedEdible Uses: Root - raw or cooked[2, 22, 196]. It is the source of 'canna starch' which is used as an arrowroot[1, 46, 171, 183]. The arrowroot is obtained by rasping the root to a pulp, then washing and straining to get rid of the fibres[2]. This starch is very digestible [196]. The very young tubers can also be eaten cooked[61, 105, 142, 177], they are sweet but fibrousy[97, K]. The root can be very large, sometimes as long as a person's forearm[196]. In Peru the roots are baked for up to 12 hours by which time they become a white, translucent. fibrous and somewhat mucilaginous mass with a sweetish taste[183, 196]. The starch is in very large grains, about three times the size of potato starch grains, and can be seen with the naked eye[183, 196]. This starch is easily separated from the fibre of the root[196]. The roots contain about 25% starch[61]. The dry matter contains about 75 - 80% starch, 6 - 14% sugar, 1 - 3% protein, it is high in potassium, low in calcium and phosphorus[196]. Young shoots - cooked and eaten as a green vegetable[183, 196]. Quite nutritious, containing at least 10% protein[196]. The immature seeds are cooked in fat tortillas[183].

tcanta Fodder Mulch Size StarchThe starch from the roots is sometimes used as a laundry starch or for sizing[196]. The leaves are cut for mulch. Weed barrier. Low windbreak. Animal fodder.

nrakta S. America. W. Indies. ksacta By the coast and in temperate valleys of the Andes[97]. Usually found at the edges of moist thickets or in ditches[196].

propta Seed - pre-soak for 24 hours in warm water and sow February/March in a warm greenhouse at 20°c[1, 138]. Plant the seeds 2 - 5cm deep in individual pots[1]. Scarifying the seed can speed germination, especially if the seed has not swollen after being soaked[124, K]. The seed usually germinates in 3 - 9 weeks[138]. Grow the plants on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of the root clump as the plant comes into growth in the spring. Each portion must have at least one growing point. Pot up the divisions and grow them on in the greenhouse until they are well established and then plant them out in the summer. Root cuttings.

nwatta Requires a deep rich well-drained soil in a sunny position[1, 200]. Tolerates heavy soils[196]. The plant has large leaves and dislikes windy conditions since this can tear the leaves to shreds[200]. Requires ample water in the growing season[196]. Tolerates a pH range from 4.5 to 8[196]. This species is probably hardy in the mildest areas of Britain but even then it should be given a good mulch if left in the ground overwinter[1]. The top growth tolerates light frosts and plants can be grown in areas with winter snow[196]. The tubers can be harvested in late autumn after the top growth has been killed back by frost and stored over winter. They should be kept in a frost-free place covered in moist soil or leaves[1]. According to some botanists this species is no more than a synonym for C. indica[200]. Cultivated for its edible root in the Tropics, there are some named varieties[46, 196]. The root can be harvested within 6 months from planting out, though larger yields are obtained after 8 - 10 months[196]. In the British climate this probably means 2 years growth is required for good yields[K]. Yields in the Andes range from 13 - 85 tonnes per hectare, with 22 - 50 tonnes being average[196]. Plants are rarely troubled by pests or diseases[196]. Most cultivated forms do not produce fertile seed[196]. There are also sterile triploid forms, these contain a significantly higher proportion of starch though their cropping potential is not known[196]. Slugs love the young growth in spring and can cause serious damage to plants[233].

### 8.2.88 Bomarea edulis

7tlin 10 cyuc 3 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Bomarea edulis is a PERENNIAL CLIMBER growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Tuber - cooked[1. 22, 46, 61, 1771. When boiled the roots make a light and delicate food[2]. Rich in starch, a cream made from this farinaceous matter is wholesome and very agreeable to the

nrakta C. and S. America - Mexico to Peru, ksacta Found in mountains, in oak woodlands to tropical woodlands. Disturbed areas and forests from sea level to 3000 metres.

propta Seed - best sown as soon as it is ripe in a warm greenhouse, it will germinate in a few weeks[1]. Stratify stored seed for 3 weeks at 20°c, then 3 weeks at 5°c[138]. It usually germinates in 1 - 2 months at 20°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in early summer. Division in spring, with care since the roots are brittle. Each portion must have some roots and a growth bud[1]. Pot up the divisions, grow them on in the greenhouse until they are well established and then plant them out into their permanent positions in the summer or late spring of the following year.

nwatta Requires a warm sunny position and a welldrained slightly acid soil[1, 200]. Succeeds in any good soil in sun or partial shade[187]. One report says that plants are possibly hardy in the milder areas of Britain[1]. However a plant has been growing in an outdoor bed at Kew in light woodland for at least 4 years (1992) where it has flowered and produced seed in most years[K]. Another report says that it is hardy to about -10°c[187]. Plants prefer a minimum night temperature of 10°c[138]. Keep the plants almost dry in winter[138] and apply a good thick organic mulch to the roots[200]. The mulch should be removed as growth commences in the spring because the young shoots are very susceptible to slug damage[K]. The edible roots are sold in local markets in S. America[2]. The tubers should be planted about 15cm deep n the soil[233]. This genus is closely related to Alstroemeria species[200].

# 8.2.89 Phyllostachys makinoi

Kei-Chiku, Makino bamboo

7 tlin 10 cvuc 3 kcak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phyllostachys makinoi is an evergreen Bamboo growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots cooked[183]. They are usually boiled in at least one change of water. The shoots are 3 - 8cm in diameter[266], they are harvested in the spring when they are about 8cm above the ground, cutting them about 5cm below soil level.

tcanta WoodThe culms are tough and compact.they are used for building, papermaking and in making furniture, umbrellas, containers and agriculture implements[266]. The canes are a very important source of material for scaffolding and construction in Taiwan[195].

nrakta E. Asia - China, ksacta Open forest at elevations up to 1500 metres[266].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Divisions from the open ground do not transplant well, so will need careful treatment and nurturing under cover in pots until at least late spring[238]. Division is best carried out in wet weather and small divisions will establish better than large clumps[238]. Another report says that you can take large divisions from established clumps and transfer them straight to their permanent positions, misting or drenching them frequently until they are established[200]. Basal cane cuttings in spring.

nwatta Requires a rich damp soil in a sheltered position. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It dislikes prolonged exposure to hard frosts[200]. This is a good companion species to grow in a woodland because the plants are shallow rooted and do not compete with deep rooted trees[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

#### 8.2.90 Podocarpus nivalis

Alnine Totara

7 tlin 11 cvuc 3 kcak 3 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hna7tmwatli nyanhien hionli

drutta Podocarpus nivalis is an evergreen Shrub growing to 3 m (9ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Superficially similar to Taxus species, but this plant is definitely not poisonous[200].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[1]. Sweet and pleasant to taste[105, 128, 173]. The fruit is about 7mm long[200].

tcanta Plants have a sprawling habit, the branches rooting as they grow, and can be grown as a tall ground cover[208]. They are best spaced about 1.2 metres apart[208].

nrakta New Zealand, ksacta Upper forest margins, subalpine slopes and occasionally in lowland forests of North and South Islands southwards from latitude 36° 50'[44]

propta The seed can be sown at any time of the year in a sandy soil in a warm greenhouse, though it is probably best sown as soon as it is ripe[1]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe terminal shoots, 5 - 10cm long, July/August in a frame[78].

nwatta Landscape Uses:Border, Cascades, Erosion control, Foundation, Ground cover, Massing. Prefers a rich moist non-alkaline soil[167]. Shade tolerant, at least when young[200]. This species is hardy to about -25°c[200], though the plants grow best in mild winter areas with plenty of rainfall and high humidity[200]. They often fruit freely in Britain[200]. A very ornamental plant[1], it is very tolerant of trimming[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Not North American native, Inconspicuous flowers or blooms.

# 8.2.91 Raphanus sativus caudatus

Rat-Tail Radish

7 tlin 10 cyuc 3 kcak 0 tcan 3 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

position in a cold frame, planting them out once they are well established in the summer.

nwatta An easily grown plant, it succeeds in ordinary garden soil[1]. It is adapted to a wide range of soil types, including upland clay, but seems to do best on porous fertile lowlands and river bottoms[269]. It does well on heavy clay soils of relatively high fertility and water holding capacity[269]. Temperatures below 13°C tend to inhibit flowering[269]. For best results, it requires a warm sunny position[1]. The plant is reported to tolerate an annual precipitation in the range of 9 to 429cm, an annual temperature in the range of 8.3 to 27.8°C and a pH of 4.9 to 8.2[269]. This species is not very winter hardy, tolerating occasional temperatures down to about -5°c so long as the soil is not too wet. It is best adapted to warm humid summer-rainfall areas in the subtropics, not growing well in strictly tropical areas[269]. A very aggressive plant[46], spreading freely at the roots and only suitable for large areas[233]. It is a parent of the cultivated Sorghum (S. bicolor)[171]. Classified as a short day plant, it does not flower if the daylight hours exceed about 13 hours per day[269].

# 8.2.112 Ferula assa

Asafoetida - Devil's Dung. Hing (Indian), Asafetida 7 tlin 10 cyuc 3 kcak 0 tcan 3 dwat 2 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ferula assa-foetida is a PERENNIAL growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Do not use orally. Avoid during pregnancy as possible increased bleeding. Topical use may cause skin irritation [301].

kcakta Edible Parts: Leaves RootEdible Uses: Condiment GumLeaves and young shoots - cooked as a vegetable [2, 4, 177, 183]. The plant has a foetid odour, but this disappears when it is boiled[2]. The cabbage-like folded heads are eaten raw as a delicacy[183]. Root - cooked[2, 4]. It needs to be steeped in order to remove a bitterness[74]. A starch extracted from the roots is used to make a porridge[74]. A gum-resin from the root is used as a food flavouring[171]. It is an essential ingredient of Worcester sauce, it is also used to flavour a wide range of dishes and drinks[183]. It is popular in natural food cuisine as a garlic substitute[183]. The resin obtained from this plant is probably the foulest-smelling of all herbs, with a sulphurous garlic-like odour[7, 238]. It is so nauseating to some people that it has been nicknamed 'dung of the devil'[7]. However, in judicious quantities it gives a surprisingly pleasant flavour to many foods[238].

tcanta Deodorant Essential Gum ParasiticideA gumresin is obtained from incisions in the roots and rhizomes[114]. The stem is removed at the end of the growing season, the root uncovered and a thin slice removed [74]. Another report says that the stem is removed as the plant starts to flower[238]. The gum exudes and hardens and a fresh slice is then made[74]. The gum should be stored in an air-tight container to prevent its strong flavour contaminating nearby substances[238]. The gum is a source of an essential oil which has medicinal properties and is also used as a food flavouring and in perfumery[46, 57, 61].

dwatta Alterative Antiperiodic Antispasmodic Aphrodisiac Cardiotonic Carminative Deobstruent Deodorant Expectorant Laxative Parasiticide Sedative Stimulant TonicAsafoetida is a very effective medicinal herb that acts mainly on the digestive system, cleansing and strengthening the gastro-intestinal tract[238]. It is much used in the Ayurvedic tradition[238]. The gum-resin contains a volatile oil that is as persistent in aroma as garlic. They leave the body via the respiratory system and aid the coughing up of congested mucous[254]. The pungently flavoured gum-resin that is obtained from the root is alterative, anthelmintic, antiperiodic, antispasmodic, carminative, deobstruent, deodorant, expectorant, laxative, sedative and stomachic[7, 21, 176, 218]. It is used in the treatment of simple digestive problems such

as wind, bloating, indigestion and constipation, and also for respiratory problems such as bronchitis, bronchial asthma and whooping cough[254]. It is also used as a circulatory stimulant, lowering blood pressure and thinning the blood[7, 21, 165, 176, 254]. The resin has a synergistic effect on other herbal preparations such as camphor, valerian and nux-vomica[7]. It is used in tincture as a mild cardio-tonic[7]. As an aphrodisiac [301]. See below under 'Uses notes' for details on harvesting the resin.

nrakta W. Asia - Afghanistan to Iran. ksacta Deserts[74]. propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their permanent positions whilst still small because the plants dis-

like root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root disturbance

nwatta Succeeds in most soils[1]. Prefers a deep fertile soil in a sunny position[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants have a long taproot and are intolerant of root disturbance[200]. They should be planted into their final positions as soon as possible. Monocarpic, the plant takes some years before it flowers and dies after flowering[74]. In Britain, the plants usually flower after about 5 years[238]. The whole plant, especially when bruised, has an unpleasant smell like stale fish[245].

# 8.2.113 Mahonia swasevi

Texas Mahonia Texas barberry

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 2.5 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mahonia swaseyi is an evergreen Shrub growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It. cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw but more usually cooked in preserves[183]. Pleasantly acid. it can also be dried and used as raisins[183]. Unfortunately, there is relatively little flesh and a lot of seeds[K]. The fruit, which can be dry or juicy, is up to 15mm in diameter[183]. 270]. The roasted seed is a coffee substitute[183].

dwatta Antibacterial Antitumor Dysentery TonicBerberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta South-western N. America. ksacta Besides rocky streams in Texas. Endemic to the Edwards Plateau in Texas, where it grows on limestone ridges and canvons at elevations of 150-600 metres[270].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

treat skin irritations including that caused by poison oak[213, 257]. A poultice of the baked bulbs has been used as an antiseptic on skin sores[257].

nrakta South-western N. America - California. ksacta Dry open hills and plains, occasionally in woods, below 1500 metres[71]

propta Seed - sow spring or summer 2mm deep in a peat/sand mix. Germination usually takes place within 1 - 6 months at 15°c, but it can be slow and erratic. Sow the seed thinly so that the seedlings do not need to be thinned and grow them on in the pot for their first year of growth, giving an occasional liquid feed o ensure that they do not become mineral deficient. When dormant, pot up 3 young bulbs per pot and grow them on for at least another 2 years before planting them out into their permanent positions in the spring[164]. Division of offsets when the bulb dies down in late summer. Larger offsets can be planted out direct into their permanent positions but it is best to pot up the smaller bulbs and grow them on for at least a year in the greenhouse.

nwatta Succeeds in any reasonably good well-drained soil[1, 42]. Prefers a rich well-drained moisture retentive soil[164]. Tolerates partial shade[164]. Dislikes dry soils according to one report[200] but plants grow in dry soils in the wild[71]. Plants are frost hardy but they come into new growth in the autumn and so need to be grown in a warm sheltered position, especially in colder areas of the country[188]. The bulbs can be damaged by heavy frosts[169]. The roots are brittle so any transplanting should be done with care[169].

# 8.2.110 Yucca whipplei

Our Lord's Candle

7 tlin 11 cvuc 3 kcak 3 tcan 0 dwat 2 m hkuc

hmim cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Yucca whipplei is an evergreen Shrub growing to 2 m (6ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

pcista The roots contain saponins[222]. Whilst saponins are quite toxic to people, they are poorly absorbed by the body and so tend to pass straight through. They are also destroyed by prolonged heat, such as slow baking in an oven. Saponins are found in many common foods such as beans[K]. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: Flowers Fruit Seed StemEdible Uses: Fruit - raw or cooked. Flowers - raw or cooked[46, 61, 84]. They are delicious raw, and can also be dried, crushed and used as a flavouring[84, 164]. Young flowers have been parboiled and eaten, whilst older flowers have been boiled in three lots of water before being eaten[257]. This suggests the flowers are quite bitter[K]. Flowering stem - raw or cooked[161]. It is best used when fully grown, but before the flower buds expand[95]. It can be peeled, cut into sections then cooked and used like asparagus[95, 164]. The roasted stems have been dried, ground into a powder then mixed with water to make cakes[257]. Seed - cooked. It can be ground into a powder or cooked and used as a gruel[46, 61, 161].

tcanta Fibre SoapA fibre obtained from the leaves is used for making ropes, baskets and mats[61, 82]. It is fine and white[92]. The leaves are used as paint brushes[92]. The roots are rich in saponins and can be used as a soap substitute[82]. Carbon Farming - Industrial Crop: fiber.

nrakta South-western N. America - S. California, Mexico. ksacta Dry, grassy and often stony slopes to 1200 metres[84].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept

at a temperature of 20°c. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established [78]. Division of suckers in late spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the following spring.

nwatta Industrial Crop: Fiber Management: Standard Regional CropThrives in any soil but prefers a sandy loam and full exposure to the south[11]. Requires a sunny position[11]. Prefers a hot dry position[166], strongly disliking winter wet[11]. Established plants are very drought tolerant[200]. Plants are hardier when grown on poor sandy soils[200]. Plants are hardy to at least -5°c[200] and tolerate short periods down to -10°c[187]. They grow well in the warmer maritime areas of Britain but need protection from winter rains[182]. Plants have survived to flowering at Kew and at Bodnant in N. Wales[187]. Cultivated as a fibre plant in Mexico[61]. A very ornamental plant[1], it requires late summer and autumn warmth to initiate flowering[11]. The flowers are sweetly scented[187]. Usually monocarpic, living for a number of years without flowering and dying after it does flower[11, 164]. Plants do produce suckers, however, and can be propagated by this means[78]. The flowers of most members of this genus can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. This species, however, is self-fertile and does not require the Yucca moth for pollination, setting fruit without hand pollination[11]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]. Carbon Farming - Cultivation: regional crop. Management: standard.

# 8.2.111 Sorghum halepense

Iohnson Grass

7 tlin 10 cyuc 3 kcak 3 tcan 1 dwat 2 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Sorghum halepense is a PERENNIAL growing to 2 m (6ft) by 1.2 m (4ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate droudht.

pcista The pollen can induce hay fever[269].

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked. It can be used whole in a similar manner to rice or millet, or it can be ground into a flour and used as a cereal in making bread, cakes etcl 46. 1051.

tcanta BiomassThe plant is a potential source of biomass with yields of up to 19 tonnes per hectare [269].

dwatta Demulcent DiureticThe seed is demulcent and diuretic[240].

nrakta Europe to Asia, ksacta Dry open habitats[50].

propta Seed - sow April in a greenhouse and only just cover the seed. Germination should take place within 2 weeks. Prick out the seedlings into individual pots once they are large enough to handle and plant them out after the last expected frosts. Division in mid spring as the plant comes into new growth. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded

drutta Raphanus sativus caudatus is a ANNUAL. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves SeedpodEdible Uses: Young leaves - raw or cooked[177]. A somewhat hot taste. Flowers - raw. A nice spicy addition to salads. Young seedpods - raw[1, 4, 27, 37]. Crisp and juicy, they must be eaten when young because they quickly become tough and fibrous. They can grow more than 60cm long, but they tend to become tough and fibrous when more than 30cm long[183].

tcanta Fodder Green manure RepellentThe growing plant repels beetles from tomatoes and cucumbers[20, 201]. It is also useful for repelling various other insect pests such as carrot root fly[201]. There is a fodder variety that grows more vigorously and is used as a green manure[87].

dwatta Anthelmintic Antibacterial Antifungal Antiscorbutic Antispasmodic Astringent Cancer Carminative Cholagogue Digestive Diuretic Expectorant Laxative Poultice StomachicRadishes have long been grown as a food crop, but they also have various medicinal actions. The roots stimulate the appetite and digestion, having a tonic and laxative effect upon the intestines and indirectly stimulating the flow of bile[254]. Consuming radish generally results in improved digestion, but some people are sensitive to its acridity and robust action[254]. The plant is used in the treatment of intestinal parasites, though the part of the plant used is not specified[147]. The leaves, seeds and old roots are used in the treatment of asthma and other chest complaints[218]. The juice of the fresh leaves is diuretic and laxative[240]. The seed is carminative, diuretic, expectorant, laxative and stomachic[176, 218, 240]. It is taken internally in the treatment of indigestion, abdominal bloating, wind, acid regurgitation, diarrhoea and bronchitis[238]. The root is antiscorbutic, antispasmodic, astringent, cholagogue, digestive and diuretic[21, 218]. It is crushed and used as a poultice for burns, bruises and smelly feet[218]. Radishes are also an excellent food remedy for stone, gravel and scorbutic conditions[4]. The root is best harvested before the plant flowers[21]. Its use is not recommended if the stomach or intestines are inflamed[21]. The plant contains raphanin, which is antibacterial and antifungal[218, 238]. It inhibits the growth of Staphylococcus aureus, E. coli, streptococci, Pneumococci etc[176]. The plant also shows anti-tumour activity[218].

nrakta This plant's origin is uncertain, it possibly arose out of cultivation[200]. ksacta Not known in a truly wild situation

propta Seed - sow spring in situ. Germination should take place within 2 weeks.

nwatta Prefers a rich soil with ample moisture[16, 52]. Dislikes very heavy or acid soils[16, 37]. Plants are susceptible to drought and require irrigation during dry spells in the summer or the root quality will rapidly deteriorate and the plant will go to seed. The rat-tailed radishes are some times cultivated for their large edible seedpods, there are some named varieties[183]. This group of radishes does not produce roots of good quality, it is cultivated mainly for the edible young seedpods which are harvested in the summer. Radishes are a good companion plant for lettuces, nasturtiums, peas and chervil, tomatoes and cucumbers[18, 20]. They are said to repel cucumber beetles if planted near cucumber plants and they also repel the vine borers which attack squashes, marrows and courgettes[238]. They grow badly with hyssop[18, 20] and with grape vines[201].

#### 8.2.92 Vaccinium modestum

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli xre7t hjonli

drutta Vaccinium modestum is a deciduous Shrub growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to September; and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable

pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. Pleasant tasting[1, 200]. The fruit is upto 1cm in diameter[266].

nrakta E. Asia - China to the Himalayas. ksacta Cliffs, Abies forests, alpine meadows and thickets at elevations of 3100 - 4000 metres[266].

propta Seed - sow late winter in a greenhouse in a lime-free potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Plants in this genus are notably resistant to honey fungus[200].

# 8.2.93 Melianthus major

Honey Flower

7 tlin 10 cyuc 3 kcak 1 tcan 1 dwat m hkuc

hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Melianthus major is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista The root is poisonous[73].

kcakta Edible Parts: NectarEdible Uses: SweetenerThe honey-like nectar from the flowers is eaten[2, 105, 177, 183]. Deliciously sweet, a tiny bit seems to go a long way - which is very useful since the plant does not produce that much in the British climate[K]

tcanta DyeA violet dye is obtained from the flowers[168]. dwatta Antidote Emetic VulneraryVulnerary[46, 61]. The root is poisonous and emetic, but is used as a remedy against snake bites[240].

nrakta S. Africa and India. ksacta Damp sandy ar-

propta Seed - sow spring in a warm greenhouse[188]. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the seedlings for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts[K]. Cuttings of greenwood stem tips in a frame in summer[200]. Suckers in spring[200]. They can be planted out immediately or potted up and kept in a frame for their first winter.

nwatta Requires a well-drained moisture retentive soil in full sun or light shade[200]. Prefers a rich loamy soil[1]. Fertile soils give good foliage effects but the plant flowers better on a poor soil[200]. A very ornamental plant it is only hardy in the milder areas of Britain[1], flowering freely in Cornwall[59]. In colder parts of the country it can be grown as a herbaceous perennial, dying down in winter but regrowing from the base in the spring[166, 200]. In these areas

the rootstock must be well mulched[200]. The top growth is possibly hardy for short periods down to -10°c, whilst the rootstock is possibly hardy to -15°c if it is well mulched[187]. The flowers have a honey-like scent[245]. The bruised leaves have a strong aroma somewhat like peanut butter[K]. Plants are often used in sub-tropical bedding schemes[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.94 Arthropodium milleflorum

Pale Vanilla Lilv

7 tlin 10 cvuc 3 kcak 0 tcan 0 dwat m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Arthropodium milleflorum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root -cooked[144]. Rather watery with a slightly sweet or bitter flavour[193]. Plants produce about 4 - 5 tubers up to 3cm long[193].

nrakta Australia - New South Wales, Tasmania, Victoria. ksacta Found in a variety of habitats from the coast to alpine areas. Eucalyptus forests, woodlands and sub-alpine meadows, favouring moist grassy sheltered slopes[193].

propta Seed - sow late winter in a cold greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in a greenhouse. Plant out in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Prefers a well-drained sandy peaty loam in a warm, sheltered sunny position[200]. Succeeds in areas where temperatures seldom fall much below freezing so long as it is given a sunny sheltered position and a well-drained soil[200]. Plants are hardy to at least -7°c in Australian gardens[157], though this cannot be translated directly to British gardens due to our cooler summers and colder longer and wetter winters. The plant has a strong scent of vanilla, this is especially noticeable on warm days[157].

#### 8.2.95 Salvia apiana

White Sage, Compact white sage 7 tlin 10 cyuc 3 kcak 0 tcan 1 dwat 3 m hkuc htut cyutli kyuctcup hwicil hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia apiana is a PERENNIAL growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Seed StemEdible Uses: Condiment DrinkSeed - raw or cooked. It can be ground into a powder and used as a mush[177, 257]. The seed has been mixed with cereals such as oats or wheat, toasted then ground into a fine powder and eaten dry[257]. The seed can also be soaked overnight and used as a drink in water or fruit juice or eaten with cereals[61, 183]. The seed is also used as a spice[105]. The leaves are used in cooking[183]. They can be used as a flavouring in seed mushes[257]. Stem tops[105, 177]. The young stalks can be eaten raw[257]. Ripe stem tops can be peeled and eaten raw[257].

tcanta Hair IncenseThe leaves have been crushed in water and used as a hair shampoo, dye and hair straightener[257]. A poultice of the freshly crushed leaves can be applied to the armpits to treat body odours[257]. The leaves have been burnt as an incense to fumigate a house after a case of contarious diseases such as measles[257].

dwatta Blood tonic OphthalmicAn infusion of the leaves is used as a blood tonic and as a treatment for coughs and

colds[257]. The leaves can be eaten, or used as a sweat bath, in the treatment of colds[257]. The seeds have been used as eye cleaners[257]. No more information is given here, but in other instances the seed has been placed in the eye, it then forms a gelatinous covering to which any foreign matter in the eye adheres. The seed is washed out of the eye by the eyes own tears[K].

nrakta South-western N. America - California. ksacta Dry benches and slopes below 1500 metres[71].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants grow best in a dry climate and can be killed by excessive winter wet[200, 260]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between 5 and -10°c[200]. The seed is sold in health food shops for its use in making a drink[183]. A good bee plant[61]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.96 Atriplex lentiformis

Quail Bush, Big saltbush, Quailbush, 7 tlin 10 cyuc 3 kcak 2 tcan 1 dwat 3 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli nyanhjen hjonli

drutta Atriplex lentiformis is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to September, and the seeds ripen from July to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It brefers dry or moist soil and can tolerate droudht.

pcista No member of this genus contains any toxins, all have more or less edible leaves. However, if grown with artificial fertilizers, they may concentrate harmful amounts of nitrates in their leaves.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and young shoots - cooked[171]. Seed - cooked[161, 177]. It can be used as a piñole or be ground into a meal and used as a porridge, a thickener in soups or added to flour for making bread[257]. The seed is rather small and fiddly to use[257].

tcanta Miscellany SoapThe crushed leaves and roots have been used as a soap for washing clothes etc[257].

dwatta Miscellany PoulticeThe fresh leaves can be chewed, or the dried leaves smoked, in the treatment of head colds[257]. The crushed flowers, stems and leaves can be steamed and inhaled to treat nasal congestion[257]. A poultice of the powdered roots has been applied to sores[257].

nrakta South-western N. America - California, Arizona, Nevada, Texas and Mexico. ksacta Saline to essentially nonsaline drainages, stream and canal banks, roadsides, warm desert shrub, saltbush, and riparian communities at elevations of 70 - 1000 metres[270].

propta Seed - sow April/May in a cold frame in a compost of peat and sand. The seed usually germinates in 1 - 3 weeks at 13°c[134]. Pot up the seedlings when still small into individual pots, grow on in a greenhouse for the first winter and plant out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Pot up as soon as they start to root (about 3 weeks) and plant out in their permanent positions late in the following spring[K]. Cuttings of mature wood of the current season's growth, November/December in a frame. Very easy. Pot up in early spring and plant out in their permanent position in early summer[K].

nwatta Landscape Uses: Border, Container, Espalier, Standard, Specimen. Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Dislikes cold winds[11]. Prefers the partial shade of a light woodland[200], growing well in a woodland clearing[166]. Many cultivars tolerate full sun, in fact one report says that the species flowers better in a sunny position[182] and another that the plant prefers a hot sunny position[188]. Plants are hardy to about -10°c[184]. Another report says that this species is very cold hardy if it is sheltered from cold winds[11]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Another report says that the plant requires hot summers if it is to do well[260]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. A very ornamental plant[1], it is closely allied to C. oleifera[11]. The cultivar 'Narumigata' (which is sometimes mistakenly called C. oleifera) is a very reliable shrub in Britain[11]. Plants resent root disturbance and are best planted out into their final positions whilst still young. This species is cultivated in Asia for the oil in its seed, there are many named varieties mostly developed for their ornamental value[182]. The flowers have a delicate sweet perfume[245]. Special Features:Attractive foliage, Not North American native, Extended bloom season in Zones 9A and above, Fragrant flowers, Blooms are very showy.

# 8.2.108 Yucca recurvifolia

Curve-leaf vucca

7 tlin 10 cyuc 3 kcak 2 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Yucca recurvifolia is an evergreen Shrub growing to 2.5 m (8ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Hand. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista The roots contain saponins[222]. Whilst saponins are quite toxic to people, they are poorly absorbed by the body and so tend to pass straight through. They are also destroyed by prolonged heat, such as slow baking in an oven. Saponins are found in many common foods such as beans[K]. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: Flowers Fruit StemEdible Uses: Fruit - raw or cooked. Flowers - raw or cooked. They are delicious raw, and can also be dried, crushed and used as a flavouring[164]. A crisp crunchy texture, the flowers are very substantial and need to be well chewed. They have a slightly bitter flavour[K]. Flowering stem - cooked and used like asparaqus[164].

tcanta Fibre SoapA fibre obtained from the leaves is used for making ropes, baskets and mats[82, 169]. The roots are rich in saponins and can be used as a soap substitute[82].

nrakta South-eastern N. America - Georgia to Missouri and Louisiana. ksacta Dunes on coastal plains[72].

propta Seed - sow spring in a greenhouse. Pre-soaking the seed for 24 hours in warm water may reduce the germination time. It usually germinates within 1 - 12 months if kept at a temperature of 20°c. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for at least their first two winters. Plant them out into their permanent positions in early summer and consider giving them some winter protection for at least their first winter outdoors - a simple pane of glass is usually sufficient[K]. Seed is not produced in Britain unless the flowers are hand pollinated. Root cuttings in late winter or early spring. Lift in April/May and remove small buds from base of stem and rhizomes. Dip in dry wood

ashes to stop any bleeding and plant in a sandy soil in pots in a greenhouse until established[78].

nwatta Thrives in any soil but prefers a sandy loam and full exposure to the south[11]. Can succeed in light shade[K]. Plants are hardier when grown on poor sandy soils[200]. Established plants are very drought tolerant[190]. Hardy to at least -15°c[187, 200], this species is the most easily cultivated of the Yuccas, resisting snow, damp and atmospheric pollution[11]. A very ornamental plant[1], there are some named varieties[182]. Closely related to Y. gloriosa[1], and possibly a sterile hybrid[11]. In the plants native environment, its flowers can only be pollinated by a certain species of moth. This moth cannot live in Britain and, if fruit and seed is required, hand pollination is necessary. This can be quite easily and successfully done using something like a small paint brush. Individual crowns are monocarpic, dying after flowering[233]. However, the crown will usually produce a number of sideshoots before it dies and these will grow on to flower in later years[233]. Plants in this genus are notably resistant to honey fungus[200]. Members of this genus seem to be immune to the predations of rabbits[233]

# 8.2.109 Chlorogalum pomeridianum

Soap Lily, Wavyleaf soap plant

7 tlin 10 cyuc 3 kcak 0 tcan 2 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Chlorogalum pomeridianum is a BULB growing to 2 m (6ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The bulb contains saponins. Although fairly toxic, these substances are very poorly absorbed by the body and most of them simply pass straight through. Saponins are found in a number of common foods, including many beans. They are destroyed by thorough cooking[K]. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: Leaves RootEdible Uses: Bulb-cooked[2, 71, 94, 105]. A slow baking in its skin will remove any soapiness in the taste[92]. The bulb should be peeled before being eaten since the skin is fibrous[183]. The bulb can also be peeled and then boiled, though the water it is cooked in should be thrown away[94]. Although wholesome and nutritious when thoroughly cooked, the raw bulb should not be eaten because it contains saponins[K]. The bulb is very large and can be up to 15cm in diameter[200]. Young leaves -raw or cooked[105]. Used as a potherb when harvested in the spring, they are very sweet when slowly baked[92, 183, 257]

tcanta Adhesive Fibre SoapA glue can be made from the sap that is expressed from baking bulbs[92, 94, 257]. The bulbs can be boiled into a liquid starch which can then be used to twined baskets to close the interstices so that seeds do not fall through[257]. A soap is obtained from the bulb[21, 46, 61, 169]. The bulb is stripped of its outer fibrous covering and rubbed on clothes or hands in water to produce a lather[92, 95]. It is very good for delicate fabrics and has a gentle affect upon the skin[92, K]. The bulb can also be dried for later use, it can then be grated as required and used as soap flakes[92]. A fibre obtained from the outer covering of the bulb is used to make small brushes or as a filling for mattresses etc[92, 94, 169, 257].

dwatta Antidandruff Antirheumatic Antiseptic Diuretic Laxative Poultice SkinSoap Illy bulbs contain saponins, a medicinally active ingredient that is of particular value as an antiseptic wash. Saponins are somewhat toxic (see the notes above on toxicity) and so any internal use of this plant should be carried out with great care[K]. The bulb is antiseptic, carminative, diuretic and laxative[94, 257]. A decoction has been used to treat wind in the stomach[257]. Externally, the bulbs have been rubbed on rheumatic joints[257]. The pounded bulbs were mixed with water and used as a hair wash in the treatment of dandruff, to prevent lice and also to

female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Flowers - raw or cooked. A delicious sweet flavour, they are excellent on their own or as part of a mixed salad[K]. The flowers produce nectar all the time they are open so, assuming the plant is grown indoors and is not visited by pollinating insects, the sweetness increases the longer the flower is open[K].

nrakta Hybrids of garden origin involving several species, especially A. megapotanicum and A. pictum. ksacta Not known in the wild

propta Seed - sow spring in a greenhouse[200]. Germination should take place within a few weeks. Once the seedlings are large enough to handle, prick them out into individual pots. Grow them on for at least the first winter in a greenhouse and plant out in late spring or early sumer, after the last expected frosts. This species is a hybrid, so the seedlings will not be true to type. Cuttings of young shoots, June in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts.

nwatta Requires a sunny position or part day shade in a fertile well-drained soil[200]. Dislikes drought[200]. All members of this genus have edible flowers - the leaves will also be edible but in our experience although they have a mild flavour the texture is not that pleasant. There has been much hybridisation within the genus by growers wishing to produce ornamental flowering plants and it is now rather difficult to assign species names for many of these cultivars. Consequently, this entry has been used to cover a range of hybrid forms of complex parentage involving several species but especially A. megapotanicum and A. pictum. Several cultivars are hardy in the mildest areas of Britain, tolerating temperatures down to about -5°c when given the protection of a south or south-west facing wall[11, 200]. Plants are often deciduous in cold winters[219]. A deep mulch in winter and tying in growth to the wall will maximise protection in winter[200]. If the plant is cut back by cold weather, it will normally resprout from the base in the spring and can flower on the current year's growth[202]. Dead-heading plants to prevent seeding can enhance longevity[200]. Tip-prune young plants to promote a bushy habit, older plants can be cut back hard annually as new growth commences in late winter or early spring if required[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.106 Cephalotaxus oliveri

7 tlin 10 cyuc 3 kcak 4 tcan 0 dwat 3 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Cephalotaxus oliveri is an evergreen Shrub growing to 3 m (9ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: Fruit SeedEdible Uses: We have no details for this species but it is in a genus where many of the members have edible seed and fruit[K]. The fruit is up to 3cm long[200]. It is certainly worthy of more research[K]. The fruit does not always ripen in Britain, before full ripeness it has a disgusting resinous flavour that coats the mouth and refuses to go away for hours[K].

tcanta Hedge HedgeVery tolerant of pruning, this plant makes a very good hedge in shady positions[200].

nrakta E. Asia - W. China - Sichuan, Hubei. ksacta An understorey shrub in woodlands[200]. Coniferous and broadleaved forests at elevations of 300 - 1800 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame[113], it should then germinate in the following spring[K]. A hard seedcoat can delay germination, especially in if the seed is not sown as soon as it is ripe[81, K]. Stored seed should be cold-stratified and sown in a cold frame in the spring[200]. Germination can take 18 months or more. Prick out the seedlings as soon as they are large enough to handle and grow them on for at least their first winter under cover. Plant out in late spring after the last expected frosts. Greenwood cuttings of terminal shoots, August/September in a humid cold frame[1, 200]. Difficult[113].

nwatta Prefers a moist well-drained sandy soil but succeeds in most soils though it dislikes dry gravelly or chalky soils[1, 200]. Prefers a position in semi-shade but tolerates full shade[11, 81] and it also succeeds but does not usually thrive in full sun[200]. It grows very well in the mild wet coastal region of W. Scotland where it succeeds even in full sun[200]. Requires a humid sheltered site[200], strongly disliking very exposed positions[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Plants are dioecious, but female plants sometimes produce fruits and infertile seeds in the absence of any male plants[11]. However, at least one male plant for every five females should be grown if you are growing the plants for fruit and seed. Plants have also been known to change sex[81]. Male cones are produced in the axils of the previous year's leaves, whilst female cones are borne at the base of branchlets[200].

#### 8.2.107 Camellia sasangua

Camellia, Sasanqua camellia 7 tlin 9 cyuc 3 kcak 4 tcan 1 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia sasanqua is an evergreen Shrub growing to 3 m (9ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from October to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Oil OilEdible Uses: Oil Oil TeaThe oil obtained from the seed is edible if it is refined[46, 105, 142, 183]. It is said to be equal in quality to olive oil[2]. The leaves are mixed with tea to give it a pleasant aroma[2, 183].

tcanta Dye Hedge Hedge Oil Oil SoapA non-drying oil is obtained from the seed - used as a hair-dressing and textile oil[46, 61, 171, 177]. A green dye is obtained from the pink or red petals[168]. A decoction of the plant (could this refer to the oil in the seed??) is used as a soap substitute for washing oily clothes[178]. Plants can be used as a hedge. The cultivar 'Onigoromo' has been especially mentioned for this purpose[188].

dwatta Demulcent ExpectorantDemulcent, expectorant[178].

nrakta E. Asia - Southern Japan in Kyushu and the Islands southwards. ksacta Thickets and grassy slopes in mountains, S. Japan[58]. Forest openings[260].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. A high percentage take, but they are slow to root[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leafbud cuttings, July/August in a frame.

nwatta Requires a position in full sun in any well-drained but not too fertile soil[200]. Tolerates saline and very alkaline soils[200]. Succeeds in a hot dry position. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Forms growing in coastal and near coastal regions of California have somewhat broader, merely ovate, rounded leaves, and they have been regarded either at species level as Atriplex breweri S. Watson or as a sub-species of A. lentiformis[270]. Plants are more commonly dioecious, though monoecious forms can also be found[270].

#### 8.2.97 Abutilon x milleri

Trailing Abutilon

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Abutilon x milleri is an evergreen Shrub growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers - raw or cooked. A delicious sweet flavour, they are excellent on their own or as part of a mixed salad[K]. The flowers produce nectar all the time they are open so, assuming the plant is grown indoors and is not visited by pollinating insects, the sweetness increases the longer the flower is open[K].

nrakta A hybrid of garden origin involving A. megapotanicum and probably A. pictum. ksacta Not known in the wild

propta Seed - sow spring in a greenhouse[200]. Germination should take place within a few weeks. Once the seedlings are large enough to handle, prick them out into individual pots. Grow them on for at least the first winter in a greenhouse and plant out in late spring or early sumer, after the last expected frosts. This species is a hybrid, so the seedlings will not be true to type. Cuttings of young shoots, June in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Grow on in the greenhouse for their first winter and plant out in spring after the last expected frosts.

nwatta Requires a sunny position or part day shade in a fertile well-drained soil[200]. Dislikes drought[200]. This species is only hardy in the mildest areas of Britain, tolerating temperatures down to about -5°c when given the protection of a south or south-west facing wall[11, 200]. Plants are often deciduous in cold winters[219]. A deep mulch in winter and tying in growth to the wall will maximise protection in winter[200]. If the plant is cut back by cold weather, it will normally resprout from the base in the spring and can flower on the current year's growth[202]. A hybrid of garden origin, it is similar to A. megapotanicum and probably also has A. pictum blood in it[200]. Dead-heading plants to prevent seeding can enhance longevity[200]. Tip-prune young plants to promote a bushy habit, older plants can be cut back hard annually as new growth commences in late winter or early spring if required[200]. There are some named forms, selected for their ornamental value[200]. There is a variegated form in cultivation, this variegation is as a result of infection by abutilon mosaic virus[184, 200]. Plants in this genus are notably resistant to honey fungus[200].

# 8.2.98 Mahonia haematocarpa

Mexican Barberry, Red barberry 7 tlin 10 cyuc 3 kcak 2 tcan 2 dwat 3.6 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mahonia haematocarpa is an evergreen Shrub growing to 3.6 m (11ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and fende organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[85, 257]. Juicy and acidic[3], it is used mainly for making jams and jellies in N. America[11, 183]. It makes an acceptable raw fruit and is especially nice when added to porridges or muesli[K]. Unfortunately, there is relatively little flesh and a lot of seeds[K].

tcanta DyeA green dye is obtained from the roots[168]. Yellow according to another report[257]. A green dye is obtained from the leaves[168]. Dark green, violet and dark blue-purple dyes are obtained from the fruit[168].

dwatta Antibacterial Antitumor Dysentery Ophthalmic TonicInner wood shavings can be soaked in water to make an eyewash[257]. Berberine, universally present in rhizomes of Mahonia species, has marked antibacterial effects[218] and is used as a bitter tonic[213]. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218]. The root and root bark are best harvested in the autumn[213].

nrakta South-western N. America - Texas, Colorado, New Mexico and Mexico. ksacta Slopes and flats in desert shrubland, desert grassland, and dry oak woodland; 900-2300 m; Arizona., California., Colorado., Nevada., New Mexico, Tex.; Mexico[266].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K], 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta Unlike most members of this genus, this species requires a dry, perfectly drained position in full sun, a gritty slightly acid soil is best[11, 200]. It grows best on a sunny south facing wall in Britain[11, 182] and does well in a hot, dry position[184]. It requires a position sheltered from strong or cold winds[202]. Plants are only hardy in the milder areas of the country, tolerating temperatures down to about -10°c when fully dormant[1]. The young growth in spring can be damaged by late frosts. The flowers are fragrant[245]. A very ornamental plant[1], but it does not fruit freely in Britain, the climate is too dull[11]. This species is very closely related to M. fremontii, being distinguished by the fruit which is blue-black in M. fremontii and red in M. haematocarpa[11, 67]. Hybridizes freely with other members of this genus. Resistant to honey fungus[88].

# 8.2.99 Viola mandshurica

Manchurian Violet

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Viola mandshurica is a PERENNIAL growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from April to May, and the seeds ripen from May to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Young leaves and flower buds - raw or cooked[105, 177]. When added to soup they thicken it in much the same way as okra[85, 159]. A tea can be made from the leaves[85]. Root - cooked[105, 177].

nrakta E. Asia - China, Japan, Korea. ksacta Grassy places and fields in lowland and hills all over Japan[58].

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring.

nwatta Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. All members of this genus have more or less edible leaves and flower buds, though those species with yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 1591,

#### 8.2.100 Fortunella margarita

Oval Kumquat

7 tlin 10 cvuc 3 kcak 1 tcan 0 dwat m hkuc

htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Fortunella margarita is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clav) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: FruitEdible Uses: PectinFruit - raw or cooked[183]. They can also be used in jellies, preserves etc or as a flavouring[183]. The whole fruit, rind as well, is eaten raw. It is best to first squeeze and massage the fruit in order to combine the flavours of the flesh and the rind[183]. After ripening the fruit gradually loses water content, becomes richer in flavour and is then at its best for making preserves[183]. The fruit is up to 4cm in diameter[200]. The fruit is rich in pectin, the inner peel containing about

nrakta E. Asia - S. China. ksacta Not known

propta Seed - best sown as soon as it is ripe in a warm airy position in a greenhouse. When they are large enough to handle, prick out the seedlings into individual pots and grow them on in a greenhouse for at least their first two winters. Plant out in late spring or early summer after the last expected frosts and give some winter protection from the cold

nwatta Prefers a moderately heavy loam with a generous amount of compost and sand added and a very sunny position[200]. Prefers a pH of 5 to 6[200]. Plants are intolerant of water logging[200]. This species is not hardy in the colder areas of the country, when dormant it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Kumquats are sometimes cultivated in China for their edible fruit, there are some named varieties[200]. They are hardier than the various Citrus species since they cease growth when temperatures drop below 13°c but, for best results, they are best grown in a climate where temperatures do not fall lower than between 4 and 10°c[3]. This is because the fruit is sweeter when it ripens in warm conditions[3].

#### **8.2.101** Atriplex nummularia

Giant Saltbush, Bluegreen saltbush 7 tlin 10 cvuc 3 kcak 3 tcan 2 dwat 3.5 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasilut hpa7tli flatpriklwissliphsom hpa7tmwatli hjonli

drutta Atriplex nummularia is an evergreen Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to July. The species is monoecious (individual flowers are

either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista No member of this genus contains any toxins, all have more or less edible leaves. However, if grown with artificial fertilizers, they may concentrate harmful amounts of nitrates in their leaves

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked[K]. Seed - cooked. It can be used as a piñole or be ground into a meal and used as a thickener in soups that are added to flour for making bread.

tcanta Fire retardant Fodder Hedge Soil stabilization-Fodder for sheep and cattle. A fire-retardant hedge in arid, inland areas. Agroforestry Uses: The plant has excellent potential for use as a windbreak[707]. It provides a useful windbreak which, along with readily visible leaves in the lights of cars at night, makes it suitable for roadside plantings. Ornamental. The ornamental foliage can be pruned to make hedges and provides an attractive silvery contrast against darker plants in the garden[343]. With its deep root system, the plant has good potential for use to prevent soil erosion[707]. Other Uses: The wood is a high-quality fuel[707].

dwatta The plant has been used for the treatment of scurvy and blood diseases[1096].

nrakta Australia. Naturalized in South-western N. America, ksacta Alkaline places, mainly below 600 metres in California[71]

propta Seed - sow April/May in a cold frame in a compost of peat and sand. The seed usually germinates in 1 - 3. weeks at 13°c[134]. Pot up the seedlings when still small into individual pots, grow on in a greenhouse for the first winter and plant out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Pot up as soon as they start to root (about 3 weeks) and plant out in their permanent positions late in the following spring[K]. Cuttings of mature wood of the current season's growth, November/December in a frame. Very easy. Pot up in early spring and plant out in their permanent position in early summer[K].

nwatta Agroforestry Services: Windbreak Fodder: Bank Management: Coppice Management: der Regional CropRequires a position in full sun in any well-drained but not too fertile soil[200]. Tolerates saline and very alkaline soils[200]. Succeeds in a hot dry position. This species is not hardy in the colder areas of the UK, it tolerates temperatures down to between -5 and -10°c[200]. Plants are usually monoecious but can be dioecious. Prefers an average annual rainfall between 300 - 600 mm. It is unlikely to do well in humid regions.

# 8.2.102 Aristotelia chilensis

7 tlin 10 cvuc 3 kcak 0 tcan 1 dwat 3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli nvanhien hionli

drutta Aristotelia chilensis is an evergreen Shrub growing to 3 m (9ft) by 5 m (16ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower in May, and the seeds ripen from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, insects. The plant is not self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or dried for winter use[11, 22, 46, 61, 97]. A pleasant taste somewhat like bilberries[2]. The fruit is rather small, about 6mm in diameter[200].

dwatta Astringent Febrifuge PoulticeA wine made from the fruit is said to have medicinal properties[11]. The plant (the exact part is not specified) is astringent, febrifuge and poultice. It is used in the treatment of throat infections and 8.2.104 Arctostaphylos manzanita intestinal tumours[139].

nrakta S. America - Chile, Argentina, ksacta A weedy shrub of cleared forests and waste ground, growing in damp humus rich soils on lower mountain hillsides by rivers between latitudes 31 and 40° south[139].

propta Seed - sow spring in a greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Once the plants are at least 20cm tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving them some protection from the cold for at least their first winter outdoors. Cuttings of half-ripe wood, July/August in a frame[11]. Cuttings of mature wood of the current season's growth in early winter[1]. Take cuttings 15 - 30cm long and plant them in pots or the open soil in a greenhouse. They normally root very easily and can be potted up in early summer then planted out late the following spring[K].

nwatta Prefers a slightly acid, moderately fertile welldrained soil in full sun with shelter from cold drying winds[200]. Plants are fairly tolerant of maritime exposure[K]. This species is only hardy in the milder and moister areas of Britain[182] and even there can be cut back in severe winters[K]. If the plants are cut back by winter frosts, they normally put up a crowd of vigorous shoots in the spring and these will need thinning[219]. The fruits are freely produced in S.W. England[11]. There is a very good plant at Rosehill near Falmouth[59]. The flowers are very attractive to bees[59]. Dioecious. Male and female plants must be grown if seed is required[182].

# **8.2.103** Melianthus minor

Honey Flower

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Melianthus minor is an evergreen Shrub growing to 2 m (6ft 7in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista The root is poisonous.

kcakta Edible Parts: NectarEdible Uses: SweetenerThe flowers are very rich in nectar, this is collected and

nrakta S. Africa and India. ksacta Not known

propta Seed - sow spring in a warm greenhouse[188]. Prick out the seedlings into individual pots when they are large enough to handle. Grow on the seedlings for at least their first winter in a greenhouse and plant out in late spring or early summer after the last expected frosts[K]. Cuttings of greenwood stem tips in a frame in summer[200]. Suckers in spring[200]. They can be planted out immediately or potted up and kept in a frame for their first winter.

nwatta Requires a well-drained moisture retentive soil in full sun or light shade[200]. Prefers a rich loamy soil[1]. Fertile soils give good foliage effects but the plant flowers better on a poor soil[200]. Closely related to M. major, but smaller in all parts[200]. A very ornamental plant it is only hardy in the milder areas of Britain[1], flowering freely in Cornwall[59]. In colder parts of the country it can be grown as a herbaceous perennial, dying down in winter but regrowing from the base in the spring[166, 200]. In these areas the rootstock must be well mulched[200]. The top growth is possibly hardy for short periods down to -10°c, whilst the rootstock is possibly hardy to -15°c if it is well mulched[187]. Plants are often used in sub-tropical bedding schemes[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

Manzanita, Whiteleaf manzanita, Konocti manzanita, Contra Costa manzanita, Roof's manzanita, Wieslan

7 tlin 10 cyuc 3 kcak 3 tcan 1 dwat m hkuc

hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli fyifxre7t hjonli

drutta Arctostaphylos manzanita is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 46, 61]. An agreeable acid flavour but the fruit is dry and mealy[95]. Hard to digest, the fruit should be eaten in moderation[95]. It can be dried and ground into a powder[105, 161] and then used as a flavouring in soups, bread etc[213, 257]. A cooling drink can be made from the fruit[161]. The berries can be crushed to make a sweet, unfermented cider[257]. The fruit is white but becomes redbrown. These are 12 mm across [1-4].

tcanta Dye Fuel SoapA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168]. The leaves can be boiled and the yellowish-red extract used as a cleansing body wash[257]. The wood makes an exceedingly fine fuel[257].

dwatta Appetizer Astringent Poultice StomachicA poultice of the chewed leaves is applied to sores and headaches[257]. The leaves are chewed as a treatment for stomach ache and cramps[257]. An infusion of the leaves is used to treat severe colds and diarrhoea[257]. A cider made from the fruit is used in the treatment of stomach complaints and as an appetizer to create appetite[257].

nrakta South-western N. America - California. ksacta Dry coastal slopes and in canyons up to 1200 metres[71,

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°c for 2 months[11, 200]. Another report says that the seed requires 60 days warm followed by 60 days cold stratification[160]. The seed usually germinates in 2 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or greenhouse for at least their first winter. Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. Takes one year[1, 78]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade but plants produce less fruit when they are grown in the shade[200]. Prefers a warm sunny position[3, 166]. Tolerates maritime exposure[49, 166, 182]. Plants are not hardy in the colder parts of Britain, they tolerate temperatures down to between -5 and -10°c[200]. Pollination is often poor in Britain[3]. Another report says that the plant does not fruit in this country[11]. This species is called A. pungens manzanita by some botanists[11]. A specimen seen at Cambridge B.G. was 2.5m tall in 1989[K]. Plants resent root disturbance and should be placed in their final positions as soon as possible[11, 134]. They can tolerate long dry periods [1-4].

#### 8.2.105 Abutilon species

7 tlin 10 cyuc 3 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

#### 8.2.257 Vetiveria zizanioides

Vetiveria, Vetivergrass

7 tlin 11 cyuc 2 koak 0 tcan 0 dwat 1.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Vetiveria zizanioides is an evergreen Perennial growing to 1.6 m (5ft) by 1.6 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe roots are aromatic and are used as a food flavouring[169]. An essential oil obtained from the roots is used as a flavouring in sherbets, syrup sweets, fruit drinks and canned asparagus[46, 301]. It is used in certain canned foods, such as asparagus and peas, to reinforce the natural odour and taste[310].

tcanta Essential Pot-pourri Soil stabilizationThe aromatic roots are used in pot-pourri and perfumes[169, 272]. The essential oil from the roots is used in perfumery[272]. The plant has deep-rooted and far-ranging roots that make it a valuable plant for controlling soil erosion in cultivated fields. It is often planted along the contour lines for this purpose

dwatta The essential oil obtained from the roots is used medicinally as a carminative, diaphoretic, diuretic, emmenagogue, refrigerant, stomachic, tonic, antispasmodic and sudorific(310]. A stimulant drink is made from fresh rhizomes(310]. The plants are used as an anthelmintic(310].

nrakta Tropics. ksacta Open dry places at elevations up to 1000 metres in Nepal[272].

propta Seed -

nwatta This species cannot tolerate hard frosts. In areas that experience much frost, it is better to divide up the plant in the autumn, potting up the divisions and over-wintering them in a greenhouse before planting them back outdoors in late spring[169]. Vetiveria grass is a fast-growing grass that is non-invasive, very deep rooting, insect and vermin proof. It is drought-resistant, and also withstands inundation. It is much planted in the tropics and sub-tropics where its extensive root system makes it valuable for erosion control. Vetiveria zizanioides (syn Chrysopogon zizanioides) is a plant of the tropics, where it is found at elevations up to 2,500 metres. It grows best in areas where annual daytime temperatures are within the range 22 - 35°c, but can tolerate 12 - 45°c[418]. When dormant, the plant can survive temperatures down to about -15°c, but young growth can be severely damaged at 0°c[418]. It prefers a mean annual rainfall in the range 500 - 2,500mm, but tolerates 200 - 5,000mm[418]. Prefers a moisture-retentive soil in full sun[200]. Succeeds in a very wide range of soils, tolerating occasional waterlogging once established[418]. Plants are very tolerant of saline soils[418]. Prefers a Ph in the range 4.5 - 8, tolerating 3 -9.9[418]. A yield of 1 - 5 tonnes of dried roots per hectare can be harvested annually, at an oil content of 0.7 - 2.5%, this produces 40 - 100 kilos of essential oil[418].

#### 8.2.258 Asclepias asperula

Antelope Horns, Spider milkweed, Trailing Milkweed 7 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asclepias asperula is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista Although no specific reports have been seen for this species, many, if not all, members of this genus contain toxic resinoids, alkaloids and cardiac glycosides [274]. They

are usually avoided by grazing animals[274]. This species is said to be poisonous to livestock[228].

kcakta Edible Parts: Flowers Leaves Oil Oil Seed SeedpodEdible Uses: Gum Oil Oil SweetenerThe following reports refer to other members of this genus and are possibly also appropriate for this species[K]. Unopened flower buds - cooked. They taste somewhat like peas. They are used like broccoli[183]. Flowers and young flower buds - cooked. Used as a flavouring and a thickener in soups etc[55, 102]. The flower clusters can be boiled down to make a sugary syrup[2, 85]. The flowers are harvested in the early morning with the dew still on them[95]. When boiled up it makes a brown sugar[95]. Young shoots - cooked. An asparagus substitute[2, 4, 43, 55, 62, 95, 183]. They should be used when less than 20cm tall[159]. A slightly bitter taste[159]. Tips of older shoots are cooked like spinach[85, 183]. Young seed pods, 3 - 4 cm long, cooked[2, 43, 55, 85]. They are very appetizing. Best used when about 2 - 4cm long and before the seed floss forms, on older pods remove any seed floss before cooking them[85, 159]. If picked at the right time, the pods resemble okra[183]. The sprouted seeds can be eaten[183]. An edible oil is obtained from the seed[55, 171]. The latex in the stems is made into a chewing gum[46, 61]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112].

tcanta Fibre Gum Latex Oil Oil Pollution Stuffing Wick-The following reports refer to other members of this genus and are possibly also appropriate for this species[K]. A good quality fibre is obtained from the bark, used in making twine. cloth, paper etc[95, 112, 169]. It is of poor quality in wet seasons[112]. It is easily harvested in late autumn after the plant has died down by simply pulling the fibres off the dried stems[169]. The seed floss is used to stuff pillows etc or is mixed with other fibres to make cloth[112, 159, 169, 171]. It is a Kapok substitute, used in Life Jackets or as a stuffing material[112]. Very water repellent, it can yield up to 550 kilos per hectare[112]. The floss has also been used to mop up oil spills at sea. Candlewicks can be made from the seed floss[112, 207]. Rubber can be made from latex contained in the leaves and the stems[46, 57, 102, 159]. It is found mainly in the leaves and is destroyed by frost[112]. Yields are higher on dry soils[112]. Pods contain an oil and a wax which are of potential importance. The seed contains up to 20% of an edible semi-drying oil[74, 112]. It is also used in making liquid soap[74].

dwatta ExpectorantThe plant is used as a snuff in the treatment of catarrh[257].

nrakta South-western N. America. ksacta Sandy or rocky calcareous soils[228].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 3 months at 18°c[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Landscape Uses:Border, Massing, Specimen. Succeeds in any good soil[187]. Prefers a well-drained light rich or peaty soil[1, 200]. Requires a moist peaty soil and a sunny position[111, 134]. A good bee plant[50, 74]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207]. Many members of this genus seem to be particularly prone to damage by

#### 8.2.154 Picea brachytyla

Sargent Spruce

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 40 m hkuc

htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli frusflatprik hpa7tmwatli hjonli

drutta Picea brachytyla is an evergreen Tree growing to 40 m (131ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It cannot tolerate atmospheric nollution.

kcakta Edible Parts: Flowers Inner bark SeedEdible Uses: TeaYoung male catkins - raw or cooked. Used as a flavouring[172]. Immature female cones - cooked. The central portion, when roasted, is sweet and syrupy[172]. Inner bark - dried, ground into a powder and then used as a thickener in soups etc or added to cereals when making bread[172]. An emergency food when all else fails. Seed - raw. Too small and fiddly to be worthwhile unless you are desperate[172]. A refreshing tea, rich in vitamin C, can be made from the young shoot tips[172].

tcanta WoodWood - soft, not strong. Used for general construction[46, 61]. It is also valued for its use in the pulp industry to make paper[171]. The timber is used for construction, aircraft, machines, and wood pulp[266].

nrakta E. Asia - S.W. China. ksacta Woodlands, 1600 - 2000 metres[109]. Mountain slopes, valleys and river basins at elevations of 1500 - 3800 mtres[266].

propta Seed - stratification will probably improve germination so sow fresh seed in the autumn in a cold frame if possible[80]. Sow stored seed as early in the year as possible in a cold frame [78]. A position in light shade is probably best[78]. Seed should not be allowed to dry out and should be stored in a cool place[80]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first winter. They can be planted out into their permanent positions in early summer of the following year, or be placed in an outdoor nursery bed for a year or so to increase in size. They might need protection from spring frosts. Cuttings of semiripe terminal shoots, 5 - 8cm long, August in a frame. Protect from frost. Forms roots in the spring[78]. Cuttings of mature terminal shoots, 5 - 10cm long, September/October in a cold frame. Takes 12 months[78]. Cuttings of soft to semi-ripe wood, early summer in a frame. Slow but sure.

nwatta Likes abundant moisture at the roots, if grown in drier areas it must be given a deep moist soil[11]. Tolerates poor peaty soils[200]. Succeeds in wet cold and shallow soils but is not very wind-firm in shallow soils[1]. Prefers a pH between 4 to 6[200]. Dislikes shade[200]. Intolerant of atmospheric pollution[11]. Resists wind exposure to some degree[200]. In some upland areas, especially over granitic or other base-poor soils, growth rate and health have been seriously affected by aluminium poisoning induced by acid rain[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. A very fast growing tree after a slow start. Trees might take 10 years to reach 3 metres but can then grow at an average of 50 - 60 cm a year and look set to become big trees (1975)[185]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200].

# 8.2.155 Betula alnoides

7 tlin 10 cyuc 2 kcak 3 tcan 1 dwat 40 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Betula alnoides is a deciduous Tree growing to 40 m (131ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in April, and

the seeds ripen in September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Inner barkEdible Uses: Inner bark - can be dried, then ground into a powder and added to flour for use in making bread, cakes etc[177]. Inner bark is generally only seen as a famine food, used when other forms of starch are not available or are in short supply[K].

tcanta Paper WoodThe thin layer of outer bark is used as a paper[61]. The juice of the bark is used for decorating wood[272]. Wood - moderately hard, close grained, strong, durable[146, 158]. Used for minor construction[272].

dwatta Antidote AntiseborrheicThe plant has been used as an antidote in the treatment of snake bites[240, 243]. A decoction of the bark is used to treat dislocated bones[272].

nrakta E. Asia - Himalayas to S.W. China. ksacta Forests, ravines and streamsides, Himachel Pradesh to S.W. China, 1500 - 2700 metres[51].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[78, 80, 113, 134]. Only just cover the seed and place the pot in a sunny position[78, 80, 134]. Spring sown seed should be surface sown in a sunny position in a cold frame[113, 134]. If the germination is poor, raising the temperature by covering the seed with glass can help[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. If you have sufficient seed, it can be sown in an outdoor seedbed, either as soon as it is ripe or in the early spring - do not cover the spring sown seed. Grow the plants on in the seedbed for 2 years before planting them out into their permanent positions in the winter[78, 80, 113, 134].

nwatta Succeeds in a well-drained loamy soil in a sheltered position[11, 200]. Grows well in heavy clay soils. Dislikes wet soils[200]. Shade tolerant[200]. This species is not very hardy and does not always succeed outdoors in Britain but some provenances should be hardy[11]. Hybridizes freely with other members of this genus[50]. Trees are notably susceptible to honey fungus[200].

# **8.2.156** Pinus brutia

Calabrian pine, Turkish pine

7 tlin 11 cyuc 2 kcak 3 tcan 3 dwat 30 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli frus-

flatpriklwishsom hpa7tmwatli hjonli

drutta Pinus brutia is an evergreen Tree growing to 30 m (98ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. The flowers are pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure

kcakta The resin has been used from ancient times to flavour white wines known as retsina[328]. A sap-sucking insect, Marchalina hellenica, produces large amounts of honeydew, which is harvested by honeybees and sold as 'pine honey'. Pinus brutia was planted outside its native range in Greece from early times for this harvest[329].

tcanta The resin obtained from the stem is used to flavour white wines known as retsina and for the production of turpentine[338]. Its timber is used for fencing posts, telephone posts, building timbers, railway sleepers, carpentry, boxes and crates, hardboard and pulp[328]. The "Lone Pine", a prominent landmark tree at an ANZAC First World War battle at Gallipoli, was this species. Cones from the battlefield were taken home to Australia, and plants sourced from the seeds were planted as living memorials. "Lone Pine" memorials, based on cones brought back from Gallipoli may use this species or Aleppo pine. It is widely planted in coastal areas of the Mediterranean for soil protection and as

windbreaks. Carbon Farming Solutions - Industrial Crop: hydrocarbon (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1]. A popular ornamental tree.

dwatta Oil of turpentine, obtained from the oleo-resin of all pine trees, is antiseptic, antispasmodic, astringent, directic, rubefacient, stimulant and vermifuge[4, 329]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4].

nrakta Origin: Mediterranean. Eastern Mediterranean and Black Sea regions, from the Balkans and Bulgaria to Greece, Turkey and Syria, and through the Caucasus ksacta Relatively open conifer forests, sometimes in pure stands, open mixed woodland with other drought tolerant trees; at elevations from near sea level to 1,500 metres[338].

propta Seed. Direct sow outdoors in fall/autumn

nwatta Industrial Crop: Hydrocarbon Management: Standard Regional TimberClimate: Mediterranean. Humidity: semi-arid. Pinus brutia has a near-coastal natural distribution which coincides with the Mediterranean climate characterized by cool, wet winters and hot, dry summers[338]. It is a moderately cold-hardy plant, able to tolerate temperatures down to around -15°c when fully dormant[329]. Established plants are drought tolerant[338]. The plant regenerates after fire by seed dispersal and can successfully invade maquis vegetation when this does not burn for several years[338]. In contrast with planted forests, natural forests of Pinus brutia have a diverse undergrowth of shrubs and herbs and form important habitat for wildlife[338]. Pinus brutia has been planted extensively in countries around the eastern Mediterranean and Black Sea as it is the easiest pine to grow (with Pinus halepensis) in the Mediterranean climate. Pinus brutia forms natural hybrids with its close congener Pinus halepensis where the two species are sympatric in Turkey, with matings successful only when Pinus halenensis is the nollen donor and Pinus brutia is the female parent[329]. The seed cones are - 8cm wide, ripening a shiny red-brown in spring two years after pollination. They open to release their seed the same summer or 1 - 2 years later, though the seeds are often not shed till winter rain softens the scales. The seeds are grey-brown, 7-8 × 5mm with a broad, auricled 15-20 × 10 mm wing[329]. Carbon Farming Solutions - Cultivation: regional timber. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

#### 8.2.157 Prunus cerasoides

Wild Himalayan Cherry

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 30 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Prunus cerasoides is a deciduous Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death.

kcakta Edible Parts: Fruit SeedEdible Uses: GumFruit - raw or cooked[51, 105, 158, 272]. Acid and astringent, they are only occasionally eaten raw but are more often cooked[183]. The fruit is about 15mm in diameter and contains one large seed[200]. Gum - chewed. Obtained from the trunk, it can be employed as a substitute for gum tragacanth[183], see Astragalus spp. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Beads Dye Gum WoodA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. The seeds are used as beads in necklaces and rosaries[51, 146, 158, 272]. Wood - moderately hard, strong, durable, aromatic[158]. The branches are used as walking sticks[51, 146, 158, 272].

dwatta AstringentThe fruit is astringent[272]. The juice of the bark is applied externally to treat backaches[272]. Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

nrakta E. Asia - Himalayas from Himachel Pradesh to S.W. China and Burma. ksacta Forests, 1200 - 2400 metres[51]. Forests in ravines at elevations of 700 - 3700 metres in western China[266].

propta Seed requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Thrives in a well-drained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Requires an open sunny sheltered position[166]. Not very hardy in Britain[1] but it succeeds outdoors in the milder areas of the country[166]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200].

#### 8.2.158 Ouercus semecarpifolia

7tlin10cyuc2kcak0tcan2dwat30m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus semecarpifolia is an evergreen Tree growing to 30 m (98ft 5in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Coffee DrinkSeed - cooked[105, 177]. Up to 3cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is guicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute. The sap of the plant is drunk as a tea[272].

has been known to cause stomach upsets to some people. Any toxin the fruit might contain is liable to be of very low toxicity and is destroyed when the fruit is cooked[65, 76].

kcakta Edible Parts: Fruit Leaves RootEdible Uses: Fruit - cooked. It is usually preserved, used in confectionery or as a tea[183]. The fruit is about 4mm in diameter and is borne in large clusters[200]. Some caution is advised, see notes on toxicity above. Stems and leaves - cooked[183]. Some caution is advised, see the notes on toxicity above. Root - cooked. Use with caution, see the notes above on toxicity.

tcanta ParasiticideThe plant is used to make a skin wash to rid the body of parasites[178]. (The part of the plant that is used is not detailed, it is likely to be the leaves or dried flower stalks.)

dwatta Emetic ParasiticideEmetic[178].

nrakta E. Asia - China, Japan. ksacta Thickets and woods in hills and at low elevations in mountains, C. and S. Japan [58].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame, when it should germinate in early spring. Stored seed can be sown in the spring in a cold frame but will probably germinate better if it is given 2 months warm followed by 2 months cold stratification first[78, 98, 113]. Prick out the seedlings into individual pots when they are large enough to handle. If good growth is made, the young plants can be placed in their permanent positions during the early summer. Otherwise, either put them in a sheltered nursery bed, or keep them in their pots in a sheltered position and plant them out in spring of the following year. Division of suckers in spring or autumn

nwatta Tolerates most soils, including chalk[200], but prefers a moist loamy soil[11, 200]. Grows well in heavy clay soils. Tolerates some shade but is best in a sunny position[11. Tolerates atmospheric pollution and coastal situations[200]. There is some confusion over the correct name of this species. It is said to be a synonym of S. javanica by some botanists, but this probably refers to a herbaceous plant, the correct name of which should be S. chinensis. The true S. javanica is a shrub[K].

# 8.2.255 Origanum syriacum

Bible Hyssop

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Origanum syriacum is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is polinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe leaves and flowering tops are used as a seasoning, having a flavour reminiscent of a blend of thyme, marjoram and oregano[183]. The dried herb is sometimes mixed with sumac (from Rhus species) to form the spice blend known as 'zatar', this is used along with olive oil as a topping for breads[183]. The Bedouin grind the dried leaves, add salt and eat the dry mixture on bread[177, 183]. The leaves and flowering stems of this species are often dried and supplied commercially as 'oregano', a name that should more accurately be restricted to O vulgare[238].

nrakta S. Europe - E. Mediterranean to W. Asia. ksacta Calcareous rocks and slopes, often in partial shade, 200 -2700 metres in Turkey[93].

propta Seed - sow in a greenhouse in early spring at 10-13°c and only just cover the seed. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in lune. Very

easy. Harvest the shoots with plenty of underground stem when they are about 8- 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a rather dry, warm, well-drained soil, but is not fussy as to soil type, thriving on chalk[1]. Prefers slightly alkaline conditions[1]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.256 Tropaeolum tricolorum

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Tropaeolum tricolorum is a PERENNIAL CLIMBER growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: RootEdible Uses: Tuber -cooked[177]. Small[200]. The round tubers are up to 6cm in diameter[260].

nrakta S. America - Chile, Bolivia. ksacta Not known

propta Seed - sow early spring in a greenhouse. Prick the seedlings out into individual pots once they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer, after the last expected frosts. The seed of cultivated plants is usually quite difficult to germinate, though wild-collected seed usually germinates freely[247]. Division of the tubers in the autumn or spring. In cold winter areas the tubers can be harvested in the autumn after top-growth has died down and they can then be stored in a cool frost-free position until planting them out in the spring. Cuttings of basal stems in the spring[200]. Pot them up into individual pots and place them in light shade in a frame until they are established. Plant out in early summer.

nwatta Requires a lime-free soil in a warm sunny position[1, 33, 200]. Prefers a turfy loam or a sandy peaty soil[1]. Requires a fairly dry summer after a moist winter and spring[260]. This is one of the easiest members of the genus to cultivate and usually produces new tubers quite freely[247] This species is not very hardy when grown outdoors in Britain. The top growth will survive light frosts, whilst the tubers, if well mulched, will survive to at least -5°c[1, 200]. New tubers are not formed until late in the season (from September), so a mild autumn is required for good vields[33]. The tubers are formed very near the surface of the soil[90] and will require mulching to protect them from the cold if they are to be left in the ground during the winter[K]. The tubers can also be stored in a cool dry frost-free place over the winter and then planted out in April [200]. This species comes from a dry Mediterranean-type climate and commences growth in early autumn, growing through the winter then flowering in early summer before having a short dormancy in late summer[247]. Consequently, it is only going to succeed outdoors in the very mildest parts of the country and is generally best grown in a cold greenhouse[247, K]. The plant comes from an area with intermittent and unreliable rainfall. It is therefore adapted to remaining dormant for a number of years if the growing conditions are unsuitable and this habit sometimes manifests itself in cultivation, especially if the plants have been potted up recently [247]. A plant at Rosewarne Gardens in North Devon was about 2 metres tall and flowering profusely in late April 1995[K]. A climbing plant, it supports itself by twisting its leaf stalks around other plants etc[219]. The caterpillars of the cabbage white butterfly can be a nuisance and often cause considerable damage to the leaves[219].

kcakta Edible Parts: Leaves RootEdible Uses: Root -cooked[105, 177]. When boiled in two changes of water, it is said to be excellent eating[179]. Leaves - cooked[105, 177, 179]

dwatta Antitussive ExpectorantThe root is a stimulant herb that acts mainly on the respiratory system and the heart[238]. It is antitussive and expectorant[147] and is used internally to treat dry coughs, chronic bronchitis and tuberculosis[238].

nrakta E. Asia - China. Cultivated and naturalised in Japan. ksacta Hillsides and hilly places in China[147].

propta Seed - best sown in a cold frame as soon as it is ripe [200]. The seed can also be sown in spring. Surface sow 2-3 seeds per pot in the spring in order to avoid transplanting [133]. We have found that if transplanted when very small seedlings grow away without difficulty [K]. Germinates in 1-3 months at  $10^{\circ}$ c[133]. Plant out into their permanent positions whilst young. Basal cuttings in spring [238, K]. Division in spring - very difficult because the plant dislikes root disturbance [1].

nwatta Landscape Uses:Border, Massing. Prefers a light rich slightly alkaline soil that is not too dry, and a warm sunny position[1, 200]. Plants are intolerant of root disturbance[1], though they are fast-growing and can become invasive when well-sited[238]. The young growth is extremely attractive to slugs, they have been known to destroy even mature plants[K]. Special Features: Attractive foliage, Attractive flowers or blooms.

# 8.2.253 Chenopodium ambrosioides anthelminticum

Wormseed

7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 1 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Chenopodium ambrosioides anthelminticum is a ANNUAL/PERENNIAL growing to 1 m (3ft 3in) by 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

pcista The essential oil in the seed and flowering plant is highly toxic. In excess it can cause dizziness, vomiting, convulsions and even death[222, 238]. The plant can also cause dermatitis or other allergic reactions[222]. The leaves and seeds of all members of this genus are more or less edible. However, many of the species in this genus contain saponins, though usually in quantities too small to do any harm. Although toxic, saponing are poorly absorbed by the body and most pass straight through without any problem. They are also broken down to a large extent in the cooking process. Saponins are found in many foods, such as some beans. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K]. The plants also contain some oxalic acid which in large quantities can lock up some of the nutrients in the food. However, even considering this, they are very nutritious vegetables in reasonable quantities. Cooking the plant will reduce its content of oxalic acid. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Leaves SeedEdible Uses: TeaLeaves - cooked[2]. The tender leaves are sometimes used as a potherb[183]. Used as a condiment in soups etc[46, 61, 105], it is said to reduce flatulence if eaten with beans[183]. The leaves have a rank taste due to the presence of resinous dots and sticky hairs[85]. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Seed - cooked[105, 161]. The seed is small and fiddly, it should be soaked in water overnight and thoroughly rinsed before it is used in order to remove any saponins. An infusion of the leaves is a tea substitute[183].

tcanta Dye InsecticideThe plant is used as a fumigant against mosquitoes and is also added to fertilizers to inhibit insect larvae[238]. Gold/green dyes can be obtained from the whole plant[168].

dwatta Analgesic Antiasthmatic Antifungal Carminative Dysentery Stomachic VermifugeWormseed is a Central American herb that has been used for centuries to expel parasitic worms from the body[254]. The whole plant is analgesic, antiasthmatic, carminative, stomachic and vermifuge[1, 4, 21, 57, 145, 147, 171]. An infusion can be used as a digestive remedy, being taken to settle a wide range of problems such colic and stomach pains[254]. Externally, it has been used as a wash for haemorrhoids, as a poultice to detoxify snake bites and other poisons and is thought to have woundhealing properties[254]. Use with caution and preferably under the supervision of a qualified practitioner[21, 238]. This remedy should not be prescribed for pregnant women[238]. See also the notes above on toxicity. Until fairly recently, this was one of the most commonly used vermifuges, though it has now been largely replaced by synthetic drugs[222]. The seed, or an essential oil expressed from the seed, was used[213]. It is very effective against most parasites, including the amoeba that causes dysentery, but is less effective against tapeworm[213, 238]. Fasting should not precede its use and there have occasionally been cases of poisoning caused by this treatment[213]. The oil is used externally to treat athlete's foot and insect bites[238]. One report says that it is an essential oil that is utilised[240]. This is obtained from the seed or the flowering stems, it is at its highest concentration in the flowering stems before seed is set, these contain around 0.7% essential oil of which almost 50% is the active vermifuge ascaridol[240]. The essential oil is of similar quality from plants cultivated in warm climates and those in cool climates 240]. The leaves are added in small quantities as a flavouring for various cooked bean dishes because their carminative activity can reduce flatulence[222].

nrakta Tropical America. Naturalized in S. Europe[50]. ksacta Mainly found on dry wasteland and cultivated ground[204, 268].

propta Seed - whilst it can be sown in situ in mid to late spring, we have had better results by sowing the seed in a cold frame in early spring. Put a few seeds in each pot and thin to the best plant if necessary. Germination rates are usually very good and the seedlings should appear within a few days of sowing the seed. Plant out in late spring, after the last expected frosts.

nwatta An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200]. Tolerates a pH in the range 5.2 to 8.3. Plants are annuals or short-lived perennials[238]. They are not very hardy when grown outdoors in Britain and so are best grown as an annual[238]. Plants have often self-sown freely in our Cornish trial grounds, but the seed germinates in the autumn and does not manage to survive the winter[238]. Wormseed is sometimes grown as a medicinal and culinary plant, especially in its native Mexico. This sub-species is more active medicinally than the type species and is the form most often cultivated for its vermicidal activity[4, 46, 50, 238]. It is one of the safest and best vermifuges available[4]. The bruised leaves emit an unpleasant foetid odour[245].

# 8.2.254 Sambucus chinensis

Chinese Elder

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hna7tmwatli xra7t hionli

drutta Sambucus chinensis is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, the leaves and stems of some, if not all, members of this genus are poisonous[9, 76]. The fruit of many species (although no records have been seen for this species) tcanta Charcoal Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is a source of tannins[272]. Wood - very hard, close grained, splits in seasoning. Used for construction[272]. An excellent fuel, it also yields a good charcoal[146, 158, 272].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. The juice of the bark is applied externally to treat muscular pains[272].

nrakta E. Asia - China to the Himalayas. ksacta Often the dominant species on north-facing slopes in the Himalayas, from 2400 - 3600 metres[11, 146]. In China it grows right up to the tree-line, where it becomes a thicket-forming shrub[11].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Older trees dislike shade[146]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Trees respond well to coppicing[146, 158]. The seed ripens in its second year[200]. Inclerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.159 Ouercus lobata

Californian White Oak, Valley oak 7 tlin 11 cyuc 2 kcak 0 tcan 2 dwat 30 m hkuc hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus lobata is a deciduous Tree growing to 30 m (98ft 5in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[257]. A staple food for several native North American Indian tribes[257]. Quite large, it is up to 5cm long and 15mm wide[82, 200]. The seed of this species is sweet and low in tannin and needs little if any leeching [183, 229]. Any bitter tanning can be leached out by thoroughly washing the dried and ground up seed in water, though many minerals will also be lost. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The seed can be roasted and then eaten, its taste is something like a cross between sunflower seeds and popcorn[183]. The seed can also be ground into a powder and used in making bread etc[183]. Roasted seed is a coffee substitute.

tcanta Adhesive Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The acorn meal has been used to mend cracks in clay pots[257]. Wood - hard and fine grained but brittle and weak. Of no commercial value, it is used only for fuel[82, 229].

dwatta Astringent Dysentery Poultice SalveAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. A poultice of the ground galls and salt has been used as a treatment for burns, sores and cuts[257]. A decoction of the bark has been used as a cough medicine and a treatment for diarrhoea[257]. The pulverized bark has been used as a dusting powder to dry up running sores, it is particularly useful for babies with sore umbilicus[257].

nrakta South-western N. America - California. ksacta Fertile lowlands in deep rich soils in the valleys of W. California between the Sierra Nevada and the coast[82, 229].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses:Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[11, 200]. A fairly long-lived tree in the wild, with specimens 300 - 400 years old recorded[229]. It is very slow growing in Britain, but there is a specimen at Kew that was 27 metres tall in 1988[11]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Good crops are produced in the wild every 2 - 3 years[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native, Inconspicuous flowers or blooms.

# 8.2.160 Ouercus leucotrichophora

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 25 m hkuc hmimhtut cyutli kyuctcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus leucotrichophora is an evergreen Tree growing to 25 m (82ħ Oin). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[177]. The seed is about 2.5cm long[200], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test

can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Charcoal Fuel Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark contains up to 23% dry weight of tannin[146]. Wood - hard, red-brown in colour, warps and splits badly when seasoning. Used for furniture and agricultural implements[61, 146, 158]. It is also a good fuel[51, 146, 272] and makes a good charcoal[61, 146].

dwatta Astringent Diuretic DysenteryThe seeds are astringent and diuretic[240]. They are used in the treatment of gonorrhoea, indigestion, diarrhoea and asthma[240]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[41].

nrakta E. Asia - Himalayas from Pakistan to C. Nepal. ksacta Forests where it is usually gregarious and common, 1200 - 2400 metres[51]. Prefers rather dry hillsides[146].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Trees can be coppiced if their trunks are up to 25cm in diameter[[146, 158]. The seed ripens in its first year[200]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

# 8.2.161 Torreya grandis

Chinese Nutmeg Tree

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 25 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli nyanhjen hjonli

drutta Torreya grandis is an evergreen Tree growing to 25 m (82ft 0in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in April, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - roasted[46, 61, 63, 105, 183, 266]. An edible oil is obtained from the seed[266].

tcanta Essential Oil WoodAn essential oil is extracted from the aril (fruit)[266]. The wood is used in constructing buildings, bridges, and furniture[266].

dwatta Anthelmintic Antitussive Carminative LaxativeThe flowers are anthelmintic and carminative[218]. The seed is anthelmintic, antitussive, laxative and peptic[218].

nrakta E. Asia - C. and E. China. ksacta Woodlands, 1000 - 1600 metres[109]. Mountains, open valleys, often by streams, on yellow, red, and dark soils at elevations of 200-1400 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame. Some of the seed should germinate in the following spring though much of it might take another 12 months. Stored seed requires a period of cold stratification and can take 18 months or more to germinate. Prick out the seedlings into individual pots as soon as growth is observed and grow them on in light shade in the greenhouse for at least the next couple of winters, making sure to pot them on into larger pots as and when required. Plant them out into their permanent positions in early summer when the plants are at least 20cm tall. Cuttings of half-ripe shoots in late summer[1]. Cuttings do not grow well[11]. Layering.

nwatta Management: Standard Regional Crop Staple Crop: Protein-oilSucceeds in ordinary garden soil, tolerating some lime[1]. Requires a sheltered position and either high humidity or a moist riverside soil[200]. Dislikes wind exposure[200]. Tolerates woodland shade very well[200]. Requires hot, very humid summers for best growth[200]. This species is not very hardy in Britain, it only succeeds outdoors in the milder areas of the country[1]. It succeeds outdoors at Kew[11], a tree was 8 metres tall in 1970[185]. The seed takes two summers to mature[229]. The edible seed of this very ornamental evergreen tree is often sold in local markets in China. Closely related to T. nucifera[200]. Plants are dioecious so both male and female plants are required if seed is to be produced. Occasional trees are monoecious with dioecious branches.

# 8.2.162 Castanopsis orthacantha

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 20 m hkuc hmim cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli hionli

drutta Castanopsis orthacantha is an evergreen Tree growing to 20 m (65ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, midges. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil

kcakta Edible Parts: SeedEdible Uses: Seed - raw or cooked[177]. The seed, which is up to 15mm in diameter, takes about 18 months to ripen[266].

nrakta E. Asia - S.W. China. ksacta Mixed and broadleaved evergreen forests; 1500-3200 metres in W Guizhou, SW Sichuan, Yunnan[266].

propta Seed - requires a period of cold stratification and is best sown as soon as it is ripe in a cold frame[138]. The seed has a short viability and should not be allowed to dry out. It can be stored for a few months if kept cool and moist (putting it in a plastic bag that is placed in the salad compartment of a fridge works well). Stored seed should be soaked in warm water for 24 - 48 hours prior to sowing[138]. Germination usually takes place within 1 - 3 months at 15°c[138]. As soon as they are large enough to handle, prick out the seedlings into individual pots and plant them out in mid summer if possible, otherwise grow them on in a cold frame for their first winter and plant them out in late spring. Give the young plants some protection from cold for their first few winters autifors.

nwatta Prefers a good deep medium to stiff loam[1]. Requires a sheltered position in semi-shade and a lime-free soil[138]. Although cold hardy in much of Britain, tolerating temperatures down to about -10°c, this species really requires a warm continental climate if it is to prosper and it does not do well in the maritime climate of this country[200]. The seed takes two growing seasons from fertilization to maturity[266]. The catkins have an unpleasant hawthorn-like smell to attract midges for their pollination[245].

nwatta Requires a sheltered sunny position in a well-drained soil. This species is not very cold hardy, tolerating temperatures down to about -5°c[200]. It can succeed out-doors in the milder areas of Britain, especially if given the protection of a south or west facing wall.

# 8.2.250 Salvia pomifera

Apple Sage

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 1 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Salvia pomifera is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves have a strong odour and flavour, resembling lavender and common sage[183]. They are used as an adulterant of sage as a commercial food flavouring[183, 238]. An infusion of the herb is used to make a tea[183]. Very fragrant, it is called 'fascomiglia'[200]. Semi-transparent galls are formed on the plant as a result of gall wasps invading the young branches. These galls are made into a kind of conserve or sweetmeat by crystallizing them in sugar and this is regarded as a great delicacy by the Greeks[183, 200]. They have an agreeable and astringent flavour[4]. We are not sure if the galls are used before or after the insect has departed[K].

dwatta MiscellanyAn infusion of the dried leaves is used medicinally in Greecel41. The report does not give any details as to the uses, but does say that in excess the tea causes profuse perspiration, languor and even faintness[4]. The leaves are said to have the same properties as common sage (S. Officinalis), but to be stronger in their action[238]. These properties are antihydrotic, antiseptic, antispasmodic, astringent, carminative, cholagogue, galactofuge, stimulant, tonic and vasodilator[4, 9, 13, 21, 165, 238].

nrakta S. Europe - Greece, Turkey and Crete. ksacta Rocky slopes, limestone cliffs and macchie from sea level to 800 metres in Turkey[93].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Soils rich in nitrogen encourage excessive leaf growth at the expense of flowering[11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between 5 and -10°c[200]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.251 Phytolacca acinosa

Indian Poke

7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phytolacca acinosa is a PERENNIAL growing to 1.5 m (5ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The leaves are poisonous. They are said to be safe to eat when young, the toxins developing as they grow older.

According to another report it is only a form with reddish purple flowers and a purple root that is poisonous[178].

kcakta Edible Parts: Leaves RootEdible Uses: Leaves they must be cooked, and are then used as a spinach[1, 2, 46, 51, 105, 183]. Only the young leaves should be used since the leaves become toxic with age. The young shoots are used as an asparagus substitute[2, 105, 183]. They have an excellent flavour[2]. Root - cooked[178]. Must be leeched first[179]. Only the white root of the white flowered form (if it exists![K]) should be eaten. See notes above.

tcanta InkA red ink is obtained from the fruit[57].

dwatta Antiasthmatic Antibacterial Antidote Antifungal Antitussive Antiviral Diuretic Expectorant Laxative Urinary VermifugeThe root is antiasthmatic, antibacterial, antidote, antifungal, antitussive, diuretic, expectorant, laxative and vermifuge[176, 178, 218, 238]. The plant has an interesting chemistry and it is currently (1995) being investigated as a potential anti-AIDS drug[238]. It contains potent antiinflammatory agents, antiviral proteins and substances that affect cell division[238]. These compounds are toxic to many disease-causing organisms, including the water snails that cause schistosomiasis[238]. The root is used internally in the treatment of urinary disorders, nephritis, oedema and abdominal distension[238]. Externally, it is used to treat boils. carbuncles and sores[238]. The roots are harvested in the autumn and dried for later use[238]. All parts of the plant are toxic, this remedy should be used with caution and preferably under the supervision of a qualified practitioner.

nrakta  $\vec{E}$ . Asia - China to India. ksacta Valleys, hillsides, forest understories, forest margins and roadsides at elevations of 500 - 3400 metres[266]. It is also found in cultivated land houses, moist fertile lands and as a weed[266].

propta Seed - sow autumn or spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer after the last expected frosts. If you have sufficient seed, it might be worthwhile trying an outdoor sowing in a seed bed in early spring. Grow the plants on in the seedbed for their first year and plant them out the following spring. Division in March or October. Use a sharp spade or knife to divide the rootstock, making sure that each section has at least one growth bud. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta An easily grown plant, succeeding in most soils[1], though preferring a moisture retentive fertile soil in full sun or partial shade[200]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring can be damaged by late frosts. Often self sows when in a suitable position[200]. Cultivated for its edible leaves in India[1, 51]. It is said that there are two forms of this plant, one with red flowers that has a poisonous root, whilst another with white flowers that has a white edible root. This white form is said to be cultivated for its edible root in parts of China[178] (I wonder if this is a mis-identification for another species? It could also be P. esculenta, which according to one report is a synonym of P. acinosa esculenta and is said to have an edible root[K]). Plants seem to be immune to the predations of rabbits[233].

#### 8.2.252 Adenophora stricta

Sha Shen, Ladybells

7 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 1 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Adenophora stricta is a PERENNIAL growing to 1 m (3ft 3in) by  $0.3\ m$  (1ft). See above for USDA hardiness. It is hardy to UK zone 7. It is in flower in September, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

less surface-rooting habit, the very dense root system of Vetiver has a strong tendency to grow downwards for 4 metres or more. This effectively anchors strips of plants and the soil behind them[ 310 ]. Traditionally, the plant is grown in southern India in strips as permanent field boundaries and occasionally in contour strips to control erosion, while in Java it is planted to protect sloping drains[ 310 ]. Its use as an erosion-control plant has spread throughout the tropics, but for a long time remained restricted to small areas. Recent interest started in Fiji, where it was grown in contour strips in sugar-cane plantations on steep slopes. Since the late 1980s, its planting for erosion control has been promoted strongly. not only around fields, but also to protect terraces and road shoulders 310 ]. Strips of densely packed, stiff and tough grass stems break the speed of run-off water and divide it evenly, reducing the risk of formation of run-off streams and gully erosion 310 ]. The plant is highly tolerant of heavy metals in the soil, including silver, cadmium, manganese and aluminium. In addition, it can grow in land where fuel has been spilt. Over a period of time it gradually accumulates these toxins which can then be removed by cutting the grass and the metals can be reclaimed[ 418 ]. Other Uses A highquality essential oil, known as 'vetiver oil' is obtained from the root[ 46, 200, 310 ]. Its scent is heavy and woody[ 310 ]. It has a wide range of applications, being used is used in perfumery, cosmetics, deodorants, soaps and other toilet articles[ 46, 200, 310 ]. In perfumery, the essential oil and vetiveryl acetate, synthesized by acetylation of vetiver oil, are important fixatives for more volatile fragrance materials. The chemical stability of vetiver oil under alkaline conditions makes it a suitable scent compound for soaps[ 310 ]. The essential oil, and the roots, have insecticidal and insectrepellent properties about which little is known[ 310 ]. The roots are used for making baskets, mats, fans or 'pamaypay' in the Philippines and cooling screens named 'tatties' in India. These give a pleasant smell to a room, especially when dampened[46, 200, 310, 454]. The dried roots, or sachets of powdered roots, are stored between clothes to give them a pleasant smell and to repel insects[ 310 ]. The stems and old leaves are an excellent, long lasting thatch and can be processed into a coarse paper-pulp[ 310 ]. Absorbs dissolved heavy metals from polluted water, tolerates As, Cd, Cr, Ni, Pb. Hg. Se and Zn.

dwatta Anthelmintic Antispasmodic Carminative Diaphoretic Diuretic Emmenagogue Refrigerant Stimulant Stomachic TonicThe essential oil obtained from the roots is used medicinally as a carminative, diaphoretic, diuretic, emmenagogue, refrigerant, stomachic, tonic, antispasmodic and sudorific[ 310 ]. A stimulant drink is made from fresh rhizomes[ 310 ] The plants are used as an anthelmintic[ 310

nrakta E. Asia - Pakistan, India, Sri Lanka, Myanmar, Thailand. ksacta Floodplains and the banks of streams and rivers[ 200 ]. Rich moist soils, often along water courses[ 454 ].

propta Seed, Division.

Crop: Biomass Management: Hay Management: Standard Minor Global CropA plant of the tropics, where it is found at elevations up to 2.500 metres. It grows best in areas where annual daytime temperatures are within the range 22 - 35°c, but can tolerate 12 - 45°c[ 418 ]. When dormant, the plant can survive temperatures down to about -15°c, but young growth can be severely damaged at 0°c[ 418 ]. It prefers a mean annual rainfall in the range 500 - 2.500mm, but tolerates 200 - 5.000mm[ 418 ]. Prefers a moisture-retentive soil in full sun[ 200 ]. Succeeds in a very wide range of soils, tolerating occasional waterlogging once established[ 418 ]. Plants are very tolerant of saline soils[ 418]. Prefers a Ph in the range 4.5 - 8, tolerating 3 - 9.9[ 418]. A yield of 1 - 5 tonnes of dried roots per hectare can be harvested annually, at an oil content of 0.7 - 2.5%, this produces 40 - 100 kilos of essential oil[ 418 ]. Tolerant to drought because of its deep roots, flood, and submergence.

#### 8.2.248 Phormium cookianum

Wharariki

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1.2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Phormium cookianum is an evergreen Perennial growing to 1.2 m (4ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil. The plant can tolerate maritime exposure.

pcista The root is highly purgative[173].

kcakta Edible Parts: NectarEdible Uses: Coffee Gum GumThe roasted seed is used as a coffee substitute[173]. An edible nectar is obtained from the flowers[173]. An edible gum is obtained from the base of the leaves[173].

tcanta Adhesive Fibre Gum GumA high quality pliable fibre is obtained from the leaves[153]. A gum found at the base of the leaves is used as a paper glue 1731.

nrakta New Zealand. Naturalized in Britain on the Scilly Isles. ksacta Coastal cliffs to mountain slopes, locally dominant on shady faces in high country, North, South and Stewart Islands[44].

propta The seed is best sown as soon as it is ripe in a cold frame. Sow stored seed in February in a cold frame. Germination is sometimes poor but should take place in 1 -6 months at 15°c. The seedlings are very variable. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed remains viable for about 12 months in normal storage[1]. Division in spring as growth commences. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Prefers a rich loamy soil[1] but is not too fussy, succeeding in peaty soils and in boggy moorland[11]. Tolerates light shade[1] but prefers full sun[200]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. Very tolerant of maritime exposure, this species is recommended for coastal plantings[166, 187]. Hardy to about -10°c[187]. Polymorphic, there are many named varieties[200]. This species often hybridizes with P. tenax and there are many cultivars of uncertain origin. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

#### 8.2.249 Cautleya spicata

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

nwatta Agroforestry Services: Contour hedgerow Industrial (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

> kcakta Edible Parts: StemEdible Uses: The pith of the stem is eaten as a vegetable[272].

> dwatta StomachicThe juice of the rhizome is used in the treatment of stomach disorders[272].

> nrakta E. Asia - Himalayas. ksacta Moist shady places at elevations of 1000 - 2600 metres in Nepal[272].

propta Seed - best sown as soon as it is ripe in a warm greenhouse at 18°c[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on for at least their first winter in the greenhouse. Plant out in late spring after the last expected frosts. Division as growth commences in the spring[200]. Dig up the clump and divide it with a sharp spade or knife, making sure that each division has a growing shoot. Larger clumps can be planted out direct into their permanent positions, but it is best to not up the smaller divisions and grow them on in a greenhouse until they are established. Plant them out in the summer or late in the following spring.

### 8.2.163 Ouercus suber

7 tlin 10 cvuc 2 kcak 4 tcan 2 dwat 20 m hkuc

hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus suber is an evergreen Tree growing to 20 m (65ft) by 15 m (49ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[105]. A famine food[177]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute. One reader noted the Q. suber population of the Mamora forest in Morocco contains only sweet acorns and can be eaten raw, it has a similar taste to raw chestnuts. The skin removes quite easyl Ouercus ilex also exists with tannin-free acorns in the moroccan forests, the locals say around 20 percent are sweet.

tcanta Cork Fodder Repellent Shelterbelt Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. A fairly windtolerant tree, it can be used in shelterbelt plantings[200]. Good on dry banks. Shade tree. Bark is the source of cork, it is much used for heat and sound insulation, flooring, floats etc. Trees are first harvested when they are 25 - 30 years old[74], and then harvested every 6 - 12 years[117]. The bark must be removed carefully so as not to harm the tree. A large tree can yield up to 1 tonne of cork. On a 10% moisture basis, the bark contains 16.9% tannin[223]. Wood.

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta S. Europe to N. Africa. ksacta Siliceous hills on the littoral[89].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Fodder: Mast Industrial Crop: Cork Industrial Crop: Tannin Management: Standard Other Systems: Dehesa Other Systems: Strip intercrop Regional CropPrefers a good deep fertile loam which can be on the stiff side[11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Cultivated for its bark in Europe, it is the main source of cork[50, 89]. Trees are first harvested when they are 25 - 30 years old and are then harvested on a 10 - 12 year rotation. Only hardy in the milder areas of Britain[200], it is not very frost resistant[98]. Trees grow well in Cornwall where there are many large specimens[11, 49, 59]. Trees grow guite well at Kew[K]. Transplants badly unless it is moved regularly, it should only be moved in September or as growth commences in late spring[11]. Does not fruit well in Britain. Most of the trees grown in Britain as Q. suber are in fact Q. suber occidentalis[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200], Heat Zone: 9-7.

### 8.2.164 Pinus pinaster

Maritime Pine

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 20 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprik hpa7tmwatli dvat hionli

drutta Pinus pinaster is an evergreen Tree growing to 20 m (65ft) by 7 m (23ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in May, and the seeds ripen in April. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure

pcista The wood, sawdust and resins from various species of pine can cause dermatitis in sensitive people[222]. Avoid if allergies. Avoid internally if suffering from asthma or bronchitis. The astringent taste may cause stomach discomfort [301]

kcakta Edible Parts: OilEdible Uses: Condiment OilSeed - raw or cooked. Rich in oil, it has a resinous flavour. The seed is about 1cm long[200]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Dve Herbicide Miscellany Oil Resin Shelterbelt Soil stabilization WoodOften planted as a shelterbelt along exposed coasts[11, 49, 59, 75, 81] and also to stabilize sandy soils[50, 89]. It is very tolerant of maritime exposure, but may require staking when it is young[75]. A tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. This species is the major source of resin in Europe, it is extensively planted, especially along the Atlantic coast of Europe[50, 64, 200]. Oleo-resins are present in the tissues of all species of pines. but these are often not present in sufficient quantity to make their extraction economically worthwhile [64]. The resins are obtained by tapping the trunk, or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc. for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative etc. Wood - rough carpentry, boxes, pit props etc. A source of pulp wood[11, 100].

dwatta MiscellanyThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns, boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

nrakta Europe - W. Mediterranean. Naturalized in Britain in some parts of the New Forest[81], ksacta Coastal sands and dunes, it is also found on mountains inland.

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to grow away[81].

nwatta Industrial Crop: Hydrocarbon Management: Standard Regional CropThrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1] and shady positions. Established plants tolerate drought[200]. Succeeds in poor dry sandy soils[185]. Tolerates maritime exposure[75], though trees are often laid over from the base by heavy winds when they are young. The stem merely bends back to the vertical and continues growing, the bend remaining in the trunk[185]. The best trees are found in the far south of Britain, where this species often self-sows. It is very fast growing, especially when young with new annual shoots of 1 metre common[185]. It is not very long-lived in cultivation[11, 185], though trees have lived longer than 150 years in Britain. Widely cultivated in Europe for the resin obtained from the trunk and for woodpulp, it is the most widely used European species[64, 200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow beneath the trees[18]. Plants in this genus are notably susceptible to honey fungus[200].

### 8.2.165 Juniperus silicicola

Southern Redcedar, Juniper, Southern Red Cedar 7 tlin 10 cyuc 2 kcak 3 tcan 2 dwat 20 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hionli

drutta Juniperus silicicola is an evergreen Tree growing to 20 m (65ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is nleaf all year, in flower from April to May, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

pcista All parts of the plant might be toxic[4, 222]. kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A thin, sweetish resinous flesh, the cones are about 7 - 10mm in diameter and have a thin skin[82, 229].

tcanta Essential Incense Insecticide Repellent Shelterbelt WoodWood - straight-grained, very durable, light, brittle, soft, easily worked, very fragrant, insect-resistant[229]. The wood does not shrink much on drying and weighs 30lb per cubic foot[227]. The reddish wood is highly prized for cabinet making[226], it is also used for fencing, the casing of lead pencils etc[229]. This tree has been over-exploited and large trees suitable for commercial exploitation are now rare[229]. The following reports are for the closely related I, virginiana, they probably also apply to this species. An essential oil is obtained from the wood[1, 46, 57, 61]. Composed of cedar camphor or cedrol[213], it is used in soaps, as an insecticide and moth repellent[61, 213], a deodorant, in polishes, perfumery etc[4, 21]. The leaves are used as an incense[46, 213] and are also either burnt or crushed and then scattered around as an insect repellent[169, 257]. The

crushed bark can be used as a soft base in cradles[257]. The bark has also been used to make mats[257]. Some cultivars of this tree are suitable for ground cover when spaced about 90cm apart each way[208]. 'Tripartita' and 'Chamberlaynii' have been recommended[208]. A fairly wind resistant tree, it can be grown as part of a shelterbelt planting[200].

dwatta Abortifacient Analgesic Anthelmintic Antirheumatic Antiseptic Aromatherapy Cancer Diaphoretic Diuretic Emmenagogue Febrifuge RubefacientThe leaves are analgesic, antirheumatic, diuretic and febrifuge[257]. An infusion has been used in the treatment of fevers, stiff neck, backache, headaches, low fever, coughs, colds and diarrhoea[257]. A decoction of the leaves has been used as a body rub and steam bath in the treatment of rheumatism[257]. The following reports are for the closely related J. virginiana, they probably also apply to this species. The leaves are anthelmintic, diuretic, rubefacient and stimulant[4, 257]. A decoction has been used in the treatment of coughs and colds, general weakness and as a medicine for convalescents[257]. The berries are anthelmintic, diaphoretic, emmenagogue and mildly antiseptic[4, 213, 222, 257]. They have been chewed as a treatment for mouth ulcers[213, 257] or made into a tea to treat colds, rheumatism, worms etc[222, 257]. The fresh young twigs are used as a diuretic[213]. An infusion has been used both internally and as a steam bath in the treatment of rheumatism[257] The essential oil from the wood is an abortifacient, in some cases it has caused vomiting, convulsions, coma and death[4, 2131. The plant is said to contain the anticancer compound podophyllotoxin[222]. The essential oil from the berries is used in aromatherapy. Its keyword is 'Composing' [210].

nrakta South-eastern N. America - South Carolina to Texas. ksacta Low wet areas of swamps, stream and creek margins and flood-plain woodlands. Tolerating varying levels of soil moisture, it also grows in open woods and abandoned fields, usually on limestone[229].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel. September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October, Takes 12 months[78].

nwatta Landscape Uses:Christmas tree, Screen, Seashore, Specimen. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11] and succeeding on chalk[200]. Established plants are drought tolerant, succeeding in hot dry positions[200]. This species is only hardy in the milder areas of the country. requiring a warm sunny sheltered position[81]. A very ornamental tree, it is a slow-growing but long-lived tree in the wild[229]. Seed production is cyclic, a year of high yields being followed by some years of low yields[229]. Closely related to J. virginiana[229]. This species often hybridizes with other members of the genus. The crushed foliage has an aroma like soap or paint[185]. Plants are resistant to honey fungus[88]. In America this tree is a host of a gall-like rust that at certain stages in its life-cycle also attacks the leaves of apple trees[149]. Plants are dioecious, male and female plants must be grown if seed is required. Special Features: Attracts birds, North American native, Fragrant foliage, Inconspicuous flowers or blooms. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is flat with shallow roots spreading near the soil surface [2-1].

giving them some protection from the cold for their next winter. Division of suckers in spring[78]. Whilst they can be placed direct into their permanent positions, better results are achieved if they are potted up and placed in a frame until established[11]. Leaf cuttings in the autumn.

nwatta We have very little information on this species, though we know it should tolerate temperatures down to about -5°c[260], and so should be hardy at least in the milder areas of Britain. The following notes are based on the general needs of the genus. An easily grown shrub, it thrives in any good garden soil[11] including heavy clays. Prefers a semishaded woodland position in a damp, slightly acid to neutral humus-rich soil[200]. Plants are very tolerant of pruning and can be cut right back into old wood if they have outgrown their welcome[182]. Hybridizes freely with other members of this genus.

### 8.2.245 Euphorbia antisyphilitica

Candelilla

7 tlin 10 cyuc 2 kcak 4 tcan 0 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Euphorbia antisyphilitica is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The sap contains a latex which is toxic on ingestion and highly irritant externally, causing photosensitive skin reactions and severe inflammation, especially on contact with eyes or open cuts. The toxicity can remain high even in dried plant material[200]. Prolonged and regular contact with the sap is inadvisable because of its carcinogenic nature[214].

kcakta Edible Parts: Edible Uses: GumA wax from the plant can be used to make chewing gum[46, 61].

tcanta Gum WaxA wax is obtained from the whole plant and is used as a polish, water proofer, for making records, lighting etc[21, 46, 57, 61]. The wax exudes from the plant pores and forms a thin skin on the stems. Most is produced in the winter and it is extracted by boiling up the plant[171]. Carbon Farming - Industrial Crop: wax. Dynamic accumulator

nrakta Southern N. America - Texas to Mexico. ksacta

propta Seed - sow spring in a warm greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings can be taken throughout the growing season. Leave them to dry and callus for 2 weeks before potting them up[1].

nwatta Experimental Crop Industrial Crop: Wax Management: CoppicePrefers a light well-drained moderately rich loam in an open position[200]. Requires ample water in the growing season but very dry conditions in the winter[1]. We are not sure if his plant can be grown outdoors in Britain[K], one report says that this plant is hardy to zone 8 (which experiences temperatures down to -5°c)[200]. Another report says that minimum winter temperatures with other members of this genus[200]. The ripe seed is released explosively from the seed capsules[200]. Members of this genus are rarely if ever troubled by browsing deer and rabbits[233]. This genus has been singled out as a potential source of latex (for making rubber) for the temperate zone although no individual species has been singled out 141.

### 8.2.246 Berberis capillaris

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli drutta Berberis capillaris is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: The following report is for the closely related B. angulosa - it quite possibly can also be applied to this species[K]. The fruit of this species is said to be somewhat larger than that of B. angulosa, with fruits up to the size of a cherry[11]. Fruit - raw or cooked. The relatively large berries are freely borne and are more palatable than most barberries. The fruit is about 15mm long and 8mm wide[200].

tcanta DyeA yellow dye is obtained from the root.

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

nrakta E. Asia - China to Burma. ksacta Not known

propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Layering.

nwatta Prefers a warm moist loamy soil but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[200]. This species does not do well in the colder areas of the country, tolerating temperatures down to about -5 to -10°c[11, 200]. Plants can be pruned back quite severely and will resprout well from the base[200]. Hybridizes freely with other members of this genus[1]. This species is closely related to B. angulosa[11, 200].

### 8.2.247 Chrysopogon zizanioides

Vetiver, Vetiver Root, Khus Khus

7 tlin 11 cyuc 2 kcak 4 tcan 2 dwat 1.8 m hkuc hmimhtut cyutli hgattcuphja7n hwicli hrasjlut hpa7tli frusflatpriklwissliphsom hpa7tmwatli hjonli

drutta Chrysopogon zizanioides is an evergreen Perennial growing to 1.8 m (6ft) by 1.8 m (6ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid, very alkaline and saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Oil RootEdible Uses: OilEdible portion: Root - oil for flavouring. An essential oil obtained from the roots is used as a flavouring in sherbets, syrup sweets, fruit drinks and canned asparagus[46, 301]. It is used in certain canned foods, such as asparagus and peas, to reinforce the natural odour and taste[310].

tcanta Basketry Biomass Cosmetic Essential Hedge Insecticide Oil Paper Soap making Soil reclamation Soil stabilization StrawOther uses rating: High (4/5). Agroforestry Uses: Unlike most grasses, which tend to have a more or

enough to handle. Grow on the young plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give some protection from the cold for at least their first couple of winters outdoors.

nwatta Requires a position in full sun in a well-drained sandy soil[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -5°c[200]. It is probably best grown against a sunny wall. If the plant needs pruning to keep it within bounds, then this is best carried out in spring or early summer. Do not cut back to wood more than 2 years old[238]. This plant is remarkable for the coating of varnish-like resin that covers the upper leaf surface[200]. The foliage is very aromatic[200].

#### 8.2.242 Billardiera longiflora

Appleberry

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 2.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flat hpa7tmwatli xre7t hjonli

drutta Billardiera longiflora is an evergreen Climber growing to 2.4 m (7ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The leaves contain saponins. Although poisonous, saponins are poorly absorbed by the human body and so most pass through without harm. Saponins are quite bitter and can be found in many common foods such as some beans. They can be removed by carefully leaching in running water. Thorough cooking, and perhaps changing the cooking water once, will also normally remove most of them. However, it is not advisable to eat large quantities of food that contain saponins. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[3, 157, 183]. Aromatic, mealy and pleasant[144]. Remove the seeds before eating the fruit[144]. The fruit does not have a pulp[154] and is dry and boring[K]. The deep blue fruit is up to 25mm long[219].

nrakta Australia - New South Wales, Tasmania, Victoria ksacta Damp forests and along the sides of streams[260].

propta Seed - best sown in a warm greenhouse as soon as it is ripe. Only just cover the seed. Sow stored seed in early spring in a warm greenhouse. The germination of fresh seed is usually prolific, but stored seed can take a year to germinate[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10 - 12cm with a heel, July/August in a frame. Fair percentage. Layering.

nwatta Requires a moist well-drained humus-rich lime-free soil in a sheltered position in sun or semi-shade with a cool root run[3, 11, 31, 200]. Plants are only hardy to about -5°c[260]. They succeed outdoors only in the mildest areas of Britain[1, 3, 49]. They can survive quite cold winters outdoors if given a suitable position[120]. They are hardy to at least -7°c in Australian gardens[157] though this cannot be translated directly to British gardens because of our cooler summers and longer, wetter and colder winters. Mulching the roots in winter will provide extra protection for the plant and even if the top is cut back by the cold it might resprout from the base[200]. A very ornamental plant[1]. The flowers are deliciously scented[245]. Any pruning is best done in spring[202].

### 8.2.243 Coprosma nitida

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli drutta Coprosma nitida is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit raw. Sweetish but not pleasant according to one report[144]. Nice according to another[177]. The orange-red fruit is about 6mm in diameter[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta Australia - Tasmania, Victoria. ksacta Mountains above 750 metres, becoming very dense and low-growing at high altitudes[11].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils[225]. This species is somewhat intolerant of frost, but some provenances should succeed outdoors at least in the milder areas of Britain. A specimen seen at Hilliers Arboretum in April 1999 was 1.5 metres tall. It had been planted in quite heavy dappled shade right next to the trunk of a fairly upright deciduous tree, though with a fairly open aspect to the south. It looked very healthy, though a bit drawn up, with no signs of any cold damage[K]. Hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

#### 8.2.244 Mahonia flavida

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 2 m hkuc pcimhmimhtut cyutli tcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mahonia flavida is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: We have no specific information on this species. The fruit of all members of the genus is edible, though we do not know the quality of this species[K].

nrakta E. Asia - South-western China - Kunming. ksacta Rocky, partially shaded crevices on limestone soils[260].

propta Seed - best sown as soon as it is ripe in a greenhouse[78]. It usually germinates in the spring[K]. 'Green' seed (harvested when the embryo has fully developed but before the seed case has dried) should be sown as soon as it is harvested and germinates within 6 weeks[K]. Stored seed should be sown as soon as possible in late winter or spring. 3 weeks cold stratification will improve its germination, which should take place in 3 - 6 months at 10°c. Prick out the seedlings when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer and consider

### 8.2.166 Quercus garryana

Oregon White Oak, Garry Oak
7 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 18 m hkuc
hmimhtut cyutli hgattcup hwicli jlutnyikfrip hpa7tli flatpriklwis hna7tmwatli hionli

drutta Quercus garryana is a deciduous Tree growing to  $18\ m$  (59ft) by  $10\ m$  (32ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower in May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed - raw or cooked[226]. Up to 25mm long[200]. Up to 32mm long and 25mm wide according to other reports[82, 229], which also said that it has a sweet taste[229]. The seed is ground into a powder and used in making bread etc, it is a good thickener for soups and stews[183]. The seed has a high content of bitter tannins, these can be leached out by thoroughly washing the dried and ground up seed in water[183], though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is guicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - hard, heavy, strong, tough, close grained, durable, easy to split. Used for furniture, cabinet making, general construction etc and also for fence posts and fuel[46, 61, 82, 171, 226, 229].

dwatta Astringent Dysentery TBAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4]. A decoction of the bark has been used in the treatment of tuberculosis[257]. An infusion of the plant has been drunk by a mother before her first baby comes[257]. The pounded bark has been rubbed on the abdomen and sides of the mother before her first delivery[257].

nrakta Western N. America - British Columbia to California. ksacta Dry prairies and foothills to rocky bluffs[60].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses: Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[11, 200]. A slow-growing and drought tolerant tree[188, 229], it can live for 500 years[229]. Seed production is cyclic, with a year of high production being followed by 2 - 3 years of lower yields[229]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance,

trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native, Inconspicuous flowers or blooms.

### 8.2.167 Quercus suber occidentalis

Cork Oak

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 18 m hkuc hmimhtut cyutli kyuctcup hwicli jlutnyikfrip hpa7tli flatprikl-

hmimhtut cyutli kyuctcup hwicli jlutnyikfrip hpa7 wis hpa7tmwatli hjonli

drutta Quercus suber occidentalis is an evergreen Tree growing to 18 m (59ft) by 13 m (42ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[105]. A famine food[177]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Cork Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Bark is the source of cork, it is much used for heat and sound insulation, flooring, floats etc. Trees are first harvested when they are 25 - 30 years old[74], and then harvested every 6 - 12 years[117]. The bark must be removed carefully so as not to harm the tree. A large tree can yield up to 1 tonne of cork. Wood.

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta S. Europe to N. Africa. ksacta Siliceous hills on the littoral[89]

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[11]. Lime tolerant[188]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. Cultivated for its bark in Europe, it is the main source of cork[50, 89]. This sub-species has slightly thinner bark than the species[11]. Trees are first harvested when they are 25 - 30 years old and are then harvested on a 10 - 12 year rotation. Only hardy in the milder areas of Britain[200], it is not very frost resistant[98]. This sub-species is somewhat hardier than the type[11]. Trees grow well in Cornwall where there are many large specimens[11, 49, 59]. There is at

least one large healthy specimen of this tree at Kew, it produced some seeds in the hot summer of 1989[K]. Transplants badly unless it is moved regularly, it should only be moved in September or as growth commences in late spring[11]. Does not fruit well in Britain. Most of the trees grown in Britain as Q. suber are in fact this sub-species[11]. Hybridizes freely with other members of the genus[200]. This species is notably resistant to honey fungus[88, 200].

### 8.2.168 Lagarostrobus franklinii

Huon Pine

7 tlin 10 cvuc 2 kcak 0 tcan 0 dwat 15 m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Lagarostrobus franklimi is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe source of an essential oil, called Huon pinewood oil, that has been recommended for the production of vanillin[61, 183]. This can be used as a flavouring in ice creams, confectionery, beverages etc[183]. It is usually obtained by steam distillation of the wood[156].

tcanta Repellent ResinThe essential oil (see above) is also used in medicinal soaps, toilet water, as a preservative in casein paints etc[46, 61, 156]. Wood -fairly hard, straight grained, light, soft, strong, aromatic. It is very durable, containing a strongly scented resin that repels insects. Used for construction, furniture etc[61, 156, 167].

nrakta Australia - S. and W. Tasmania. ksacta Banks of rivers and swampy flats to 750 metres[11, 167].

propta Seed - sow spring in a freely draining compost. Germination usually takes place within 1- 3 months at  $20^{\circ} (164]$ . Another report says that the seed can be very slow to germinate and that it is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed as early in the year as possible.

nwatta Requires a light, freely draining soil[164] in a sheltered position with protection from cold winds[166]. Requires high rainfall and humidity if it is to succeed[200]. This species tolerates shade and probably requires it in drier areas if the tree is to survive[82, 200]. It requires warm sumers if it is to grow well in this country, and even then it is very slow growing[11, 200]. Plants are only hardy in the milder areas of the country[11, 82]. An 80 year old tree at Bodnant was 6 metres tall in 1970[185]. Plants are hardy to at least -7°c in Australian gardens[157] but this cannot be translated directly to British gardens because of our cooler summers and colder, wetter winters.

#### 8.2.169 Corynocarpus spp.

Karaka

7 tlin 10 cyuc 2 kcak 4 tcan 0 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Corynocarpus spp. is an evergreen Tree growing to 15 m (49ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista None Known

kcakta Edible Parts: Fruit SeedEdible Uses:

tcanta Carbon Farming Solutions - Industrial Crop: starch (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles). Corynocarpus spp. are crops suited to woody agriculture. [1-1].

dwatta None Known

nrakta Native to New Guinea, Australia, New Zealand, New Caledonia, and Vanuatu. ksacta Coastal and lowland forest, south to latitude 44°south[44].

propta Seed - best sown in a greenhouse as soon as it is ripe[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, Iuly/August in a frame[188].

nwatta Industrial Crop: Starch Management: Standard Wild CropClimate: warm temperate to subtropical. Humidity: humid. Carbon Farming Solutions - Cultivation: wild. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

### 8.2.170 Castanopsis delavayi

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 15 m hkuc hmim cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli bionli

drutta Castanopsis delavayi is an evergreen Tree growing to 15 m (49ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind, midges. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed[105, 177]. Up tp 14mm in diameter[266]. No more details are given, but it is probably cooked.

nrakta E. Asia - S.W. China. ksacta Mixed and broadleaved evergreen forests at elevations of 1500 - 2800 metres[266].

propta Seed - requires a period of cold stratification and is best sown as soon as it is ripe in a cold frame[138]. The seed has a short viability and should not be allowed to dry out. It can be stored for a few months if kept cool and moist (putting it in a plastic bag that is placed in the salad compartment of a fridge works well). Stored seed should be soaked in warm water for 24 - 48 hours prior to sowing[138]. Germination usually takes place within 1 - 3 months at 15°c[138]. As soon as they are large enough to handle, prick out the seedlings into individual pots and plant them out in mid summer if possible, otherwise grow them on in a cold frame for their first winter and plant them out in late spring. Give the young plants some protection from cold for their first few winters outfloors.

nwatta Prefers a good deep medium to stiff loam[1]. Requires a sheltered position in semi-shade and a lime-free soil[138]. Although cold hardy at least in the milder areas of Britain, this species really requires a warm continental climate if it is to prosper and it does not do well in the maritime climate of this country[200]. The seed takes two growing seasons from fertilization to maturity[266]. The catkins have an unpleasant hawthorn-like smell to attract midges for their pollination.

### 8.2.171 Torreya yunnanensis

Yunnan Nutmeg Yew

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 15 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Torreya yunnanensis is an evergreen Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Demulcent Pectoral PurgativeDemulcent, pectoral, purgative[61].

nrakta E. Asia - Himalayas from Pakistan to Uttar Pradesh. ksacta Humus rich soils[145] in meadows and forest clearings, 1800 - 3600 metres[51]. Wet meadows or sunny slopesat elevations of 540 - 2200 metresin Tibet[266].

propta Seed - sow spring in a cold frame and only just cover the seed[200]. Germination is usually quick and good. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer[K]. Basal cuttings in spring. Cuttings of softwood in June/July[188].

nwatta Avery easily grown plant, succeeding in any ordinary garden soil in sun or partial shade[1, 187]. Prefers a light well-drained moderately fertile soil in full sun[200]. A soil that is too rich encourages foliar growth at the expense of flowering[200]. Tolerates maritime exposure[200]. Plants are hardy to about -20°c[187]. This species is considered by some botanists to be no more than a minor variant of L. thuringiaca[187].

#### 8.2.239 Aralia continentalis

Manchurian Spikenard

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 2 m hkuc pcimhmim cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aralia continentalis is a PERENNIAL growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Leaves Root StemEdible Uses: The following uses are for the closely related A. cordata. It is quite possible that they also apply to this species[K]. Shoots-cooked or raw[2, 46, 61, 105, 177]. They can be up to 1.5 metres long and have a mild and agreeable flavour[116]. They are usually blanched and are crisp and tender with a unique lemon-like flavour[183]. They can be sliced and added to salads, soups etc[206]. The shoots contain about 1.1% protein, 0.42% fat, 0.8% soluble carbohydrate, 0.55% ash[179]. Root-cooked[22, 105, 177]. Used like scorzonera[2].

nrakta E. Asia - W. and N. China, Korea, Siberia. ksacta

propta Seed - best sown as soon as ripe in a cold frame. Stored seed requires 3 - 5 months of cold stratification. Germination usually takes place within 1 - 4 months at  $20^{\circ}$ c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in light shade in a greenhouse for at least their first winter. Once the plants are 25cm or more tall, they can be planted out into their permanent positions, late spring or early summer being the best time to do this. Root cuttings 8cm long, December in a cold frame[11, 78]. Store the roots upside down in sand and pot up in March/April. High percentage[78]. Division of suckers in late winter[11]. Very easy, the suckers can be planted out direct into their permanent positions if required.

nwatta Prefers a deep moderately fertile moistureretentive well-drained loam and a semi-shady position[1, 11, 200]. Requires a sheltered position[200]. Plants are hardier when grown in poorer soils[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. This species is closely related to A. cordata[200].

### 8.2.240 Uniola paniculata

Sea Oats, Sea Oats Grass 7 tlin 11 cyuc 2 kcak 0 tcan 0 dwat 2.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli drutta Uniola paniculata is a PERENNIAL growing to 2.5 m (8ft 2in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked and eaten as a cereal[177, 183]. Said to have a very good flavour[183]. Seed production in the wild is generally poor[270].

tcanta Soil stabilizationThe spreading root system of this plant make it useful for stabilizing drifting coastal sand dunes[1, 200, 236].

nrakta Eastern N. America - Virginia to Texas and Mexico. ksacta Sandhills and drifting sands on the coast[43]. Also found on salt flats[200].

propta Seed - sow early spring in situ and only just cover the seed[1]. Division in spring[200].

nwatta Landscape Uses. Erosion control, Ground cover, Seashore.
Prefers a moist sandy soil, tolerating some shade [200]. Tolerates maritime exposure and saline soils [200]. An invasive plant, spreading freely by means of its rhizomes [236], but it is very ornamental [200]. and is well worth a place in the garden. Special Features: North American native, Naturalizing, Attractive flowers or blooms.

### 8.2.241 Eriodictyon californicum

Yerba Santa, California yerba santa 7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 2.3 m hkuc htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eriodictyon californicum is an evergreen Shrub growing to  $2.3 \, \mathrm{m}$  (7ft) by  $2 \, \mathrm{m}$  (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Not recommended during breast feeding or pregnancy. Iron and other minerals absorption can be effected by Yerba Santa [301].

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaThe fresh leaves are chewed for their refreshing taste and to relieve thirst[183]. An aromatic sweet tea is made from the fresh or dried leaves[183]. An extract of the leaves is used as a flavouring in baked goods, sweets, ice cream and soft drinks[183].

tcanta WeavingThe leaves have been woven into skirts and aprons[257].

dwatta Antiasthmatic Expectorant Pectoral TonicYerba Santa (the name means Holy weed) is a famous domestic remedy from south-western N. America where it is considered to be especially useful as an expectorant[238]. It is an ingredient of many patent cough medicines[238]. The leaves are an aromatic pleasant tasting tonic herb that reduces spasms, expels phlegm and lowers fevers[238, 254]. They are especially recommended for treating diseases of the chest and respiratory system, including asthma, and are also used in the treatment of hay fever[4, 200, 238]. A bitter tea made from the leaves has been much used as a bitter tonic and a stimulating balsamic expectorant[207, 213]. A steam bath made from the branches and leaves has been used in the treatment of rheumatism[257]. A decoction of the leaves has been used as a wash for sore areas and painful fatigued limbs[257]. A natural mouthwash is prepared by rolling the leaves into balls and allowing them to dry in the sun[213]. These are then chewed and at first have a bitter flavour but this is soon replaced by a sweetness if a drink of water is taken[213]. The leaves are harvested in the summer and dried for later use[238]. The plant has been smoked as a remedy for asthma[213]

nrakta South-western N. America - Oregon to California. ksacta Dry mountain slopes at altitudes up to 1,200 metres[254].

propta Seed - sow spring in a greenhouse[200]. Prick out the seedlings into individual pots when they are large

-10°c[200]. Mulberries have brittle roots and so need to be handled with care when planting them out[238]. Any pruning should only be carried out in the winter when the plant is fully dormant because mulberries bleed badly when cut[238]. Ideally prune only badly placed branches and dead wood[238]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.235 Arthropodium minus

Small Vanilla Lilv

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Arthropodium minus is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: RootEdible Uses: Root - cooked. Rather watery with a slightly sweet or bitter flavour[193]. Plants produce about 4 - 5 tubers, each of which are up to 3cm long[193].

nrakta Australia - New South Wales, Tasmania, Victoria. ksacta Found in a variety of habitats from the coast to alpine areas. Eucalyptus forests, woodlands and sub-alpine meadows, favouring drier habitats than A. milleflorum[193].

propta Seed - sow late winter in a cold greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in a greenhouse. Plant out in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Prefers a well-drained sandy peaty loam in a warm, sheltered sunny position[200]. Succeeds in areas where temperatures seldom fall much below freezing so long as it is given a sunny sheltered position and a well-drained soil[200]. Plants are hardy to at least -7°c in Australian gardens[157], though this cannot be translated directly to British gardens due to our cooler summers and colder longer and wetter winters. The plant has a strong scent of vanilla, this is especially noticeable on warm days[157].

#### 8.2.236 Lavatera species

Tree Lavatera

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 2.4 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Lavatera species is an evergreen Shrub growing to  $2.4\,\mathrm{m}$  (7ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: Flowers LeavesEdible Uses: Young leaves - raw or cooked. A mild flavour, but tough and not very worthwhile[K]. When cooked the leaves have a somewhat slimy consistency[K]. Flowers - raw. A pleasant mild flavour, they make a decorative addition to the salad bowl[K].

nrakta S. Europe - Greece. ksacta Not known

propta Seed - sow spring in a cold frame and only just cover the seed[200]. Germination is usually quick and good. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer[K]. Basal cuttings in spring. Cuttings of softwood in June[July[188].

nwatta Easily grown in any ordinary garden soil[1]. Prefers a light well-drained moderately fertile soil in full sun[200]. A soil that is too rich encourages foliar growth at the expense of flowering[200]. Tolerates maritime exposure[200]. An unknown species from Greece given to us by

Bill of Falmouth. It is very fast growing, even in a very exposed position but is short lived, usually only 3 - 4 years before it starts breaking up in the wind. The plant is probably too floriferous for its own good but if self-sows freely. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.237 Ferula narthex

Ferula

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 2.5 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ferula narthex is a PERENNIAL growing to 2.5 m (8ft 2in). See above for USDA hardiness. It is hardy to UK 2one 8. It is in flower in July, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Condiment GumLeaves and young shoots[105, 177]. Used as a potherb[2]. The gum obtained from the roots is used as a condiment[2, 46].

tcanta GumThe root is a source of the gum 'asafoetida'[1, 2, 61], it is used as a condiment and as a medicine. It is obtained by incision of the roots[114].

dwatta Anthelmintic Antispasmodic Carminative Contraceptive Diaphoretic Expectorant NervineThe gum resin obtained from the root is anthelmintic, antispasmodic, expectorant and nervine[240]. It is used in the treatment of asthma, whooping cough, flatulent colic, and in pneumonia and bronchitis in children[240]. The leaves are carminative and diaphoretic[240]. The plant has recently been investigated as a potential contraceptive[254].

nrakta W. Asia - Afghanistan to Pakistan. ksacta Grassy slopes at elevations around 3600 metres in Tibet[266].

propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their permanent positions whilst still small because the plants dislike root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root disturbance.

nwatta Succeeds in most soils[1]. Requires a deep fertiles soil in a sunny position[200]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. The whole plant is very strong-smelling[200]. Plants have a long taproot and are intolerant of root disturbance[200]. They should be planted into their final positions as soon as possible.

#### 8.2.238 Lavatera cachemiriana

Lavatera

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 2.4 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lavatera cachemiriana is a PERENNIAL growing to 2.4 m (7ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: LeavesEdible Uses: Young leaves - raw or cooked. A mild flavour, but they are tough and not very worthwhile[K]. When cooked they have a somewhat slimy consistency[K]. Flowers - raw. Rather bland, but an attractive garnish to a salad[K].

tcanta FibreA strong fibre is obtained from the stems, it is used for making string, bags, paper etc[74].

kcakta Edible Parts: Oil Oil SeedEdible Uses: Oil OilSeed[81]. No more details are given but it is likely that the seed can be eaten raw or cooked and is rich in oil. An edible oil is obtained from the seed.

tcanta Oil Oil WoodAn oil is extracted from the seed[266]. The high quality timber is used in constructing houses, bridges, and furniture, and for making implements and utensils[266].

nrakta E. Asia - China in Yunnan province. ksacta Coniferous and mixed forests in warm temperate zones, locally a common forest tree, at levations of 1500 - 3400 metres in NW Yunnan[266].

propta Seed - best sown as soon as it is ripe in a cold frame. Some of the seed should germinate in the following spring though much of it might take another 12 months. Stored seed requires a period of cold stratification and can take 18 months or more to germinate. Prick out the seedlings into individual pots as soon as growth is observed and grow them on in light shade in the greenhouse for at least the next couple of winters, making sure to pot them on into larger pots as and when required. Plant them out into their permanent positions in early summer when the plants are at least 20cm tall. Cuttings of half-ripe shoots in late summer[1]. Cuttings do not grow well[11]. Layering.

nwatta Succeeds in ordinary garden soil, tolerating some lime[1]. Requires a sheltered position and either high humidity or a moist riverside soil[200]. Dislikes wind exposure[200]. Tolerates woodland shade very well[200]. Requires hot, very humid summers for best growth[200]. A vulnerable species in the wild, where it is at risk of becoming extinct[266]. This species is not hardy in all parts of Britain, but trees can be grown outdoors in the milder parts of the country[81]. The seed takes two summers to mature[229]. There is some confusion over the correct name of this species, with some authorities seeing it as no more than a sub-species of T. fargesii[266]. Plants are dioecious, but sometimes monoecious with dioecious branches. Male and female plants must usually be grown if seed is required.

### 8.2.172 Corvnocarpus laevigatus

New Zealand Laurel, Karaka nut 7 tlin 10 cyuc 2 kcak 4 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Corynocarpus laevigatus is an evergreen Tree growing to 12 m (39ft) by 8 m (26ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from May to June, and the seeds ripen from December to February. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist

pcista The seed is poisonous raw[65, 173].

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw. Sweet and pulpy[1, 2, 46, 59, 61, 103, 173]. One report says that it is poisonous raw[153], though the writer might have been confused with the seed[K]. Seed - cooked[46, 59, 61, 128]. The seed needs to be soaked in salt water or thoroughly boiled or roasted in order to destroy a deleterious principle[1, 2, 63]. A staple food of the Maoris, it contains a tasteless farinaceous substance[2, 103]. The seed contains about 11% protein and 58% carbohydrate[173].

tcanta Insecticide WoodAn insecticide is made from the plant[153]. Wood. The tree trunk is used by the Maoris to make canoes[46, 61]. Carbon Farming Solutions - Industrial Crop: starch (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles). Corynocarpus spp. are crops suited to woody agriculture. [1-1].

nrakta New Zealand. ksacta Coastal and lowland forest, south to latitude 44°south[44].

propta Seed - best sown in a greenhouse as soon as it is ripe[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer.

after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[188].

nwatta Succeeds in ordinary garden soil[1]. Best grown in a woodland garden[166]. Plants are not very frost-tolerant and are only hardy outdoors in the mildest areas of Britain[1]. There is a large tree in Falmouth[59]. Plants tolerate pruning if this is necessary[188].

#### 8.2.173 Camellia semiserrata

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hionli

drutta Camellia semiserrata is an evergreen Shrub growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to March, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn oil is obtained from the seed[177]. It is used in cooking[266].

nrakta E. Asia - China. ksacta Forests, forests along river valleys at elevations of 200 - 500 metres in W Guangdong and E Guangxi Provinces[266].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species is closely related to C. reticulata[180]. The plant is often cultivated in China for the oil in its seed[177].

### 8.2.174 Podocarpus salignus

Willowleaf Podocarp

1369

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Podocarpus salignus is an evergreen Tree growing to 12 m (39ft) by 5 m (16ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen in October. The species is diocious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Superficially similar to Taxus species, but this plant is definitely not poisonous[200].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. About 8mm long[200]. We have seen no reports for this species but it is most likely that the fruit is edible.

tcanta WoodWood - straight grained, reddish, very durable lasting a long time in water, but it can be brittle.

Used for construction work and cabinet making[1, 11, 46, 61, 128].

nrakta Southern S. America - S. Chile. ksacta Temperate rain forests [214].

propta The seed can be sown at any time of the year in a sandy soil in a warm greenhouse, though it is probably best sown as soon as it is ripe[1]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe terminal shoots, 5 - 10cm long, July/August in a frame[78].

nwatta Prefers a rich moist non-alkaline soil[167]. Shade tolerant, at least when young[200]. This species is hardy to about -25°c, but the plants grow best in humid areas with high rainfall and mild winters[200]. Plants often fruit freely in Britain and self-sow freely in Cornwall[200]. A good plant for the rock garden[200]. Very tolerant of pruning[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.175 Ouercus laevis

American Turkey Oak, Turkey oak 7 tlin 9 cyuc 2 kcak 0 tcan 2 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hyisjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus laevis is a deciduous Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked. The seed is up to 27mm long and 18mm wide[82. 229]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is guicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. Wood - heavy, hard, strong, rather closegrained. Too small to be of commercial value, it makes an excellent fuel[82, 171, 229].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta South-eastern N. America - Virginia to Florida and west to Louisiana. ksacta Dry barren sandy ridges, sandy bluffs and hammocks[82], growing well in almost sterile soil[229].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left

in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. A moderately fastgrowing but short-lived species in the wild[229], trees are very slow-growing in Britain[11, 200]. They prefer warmer summers than are usually experienced in Britain, often growing poorly in this country and failing to properly ripen their wood, resulting in frost damage overwinter[200]. Seed production is cyclic, with a year of high yields being followed by 1 - 2 years of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: North American native, Attracts butterflies, Inconspicuous flowers or blooms.

#### 8.2.176 Camellia kissi

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 12 m hkuc hmimhtut, cyutli, tcup, hwicli, hrasilut, hpa7tli, flatp

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Camellia kissi is an evergreen Shrub growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Fruit OilEdible Uses: Oil TeaAn oil is obtained from the seed[180]. It is used for cooking[272]. A tea is made from the steamed then dried leaves[51, 177, 183, 272]. It is used as a substitute for China tea (obtained from C. sinensis)[240, 243]. The flowers are boiled then pickled[272]. The fruit is said to be edible[177, 183]. This seems a very strange report, the fruit is a dry wooden capsule[K].

dwatta MiscellanyThe oil is much valued in medicine[180]. No more details given.

nrakta E. Asia - C. Nepal to S.W. China. ksacta Forests and shrubberies in evergreen forests, 1000 - 2100 metres[51]. Moist ground in hill forests at elevations of 900 -2100 metres in Nepal[272].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species is sometimes cultivated in China for the edible oil contained in its seed

#### 8.2.177 Prunus caroliniana

1370

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 12 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli propta Seed - sow April/May in situ[134]. Germination is usually rapid.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though it should be possible to grow it as a spring-sown annual. The following notes are based on the general needs of the genus. Succeeds in full sun in any well-drained but not too fertile soil[200]. Most species in this genus tolerate saline and very alkaline soils[200].

### 8.2.232 Hibiscus mutabilis

Cotton Rose, Dixie rosemallow

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Hibiscus mutabilis is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from August to October, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Rutin-Leaves[177]. The leaves contain rutin, but the report does not say what quantity[218]. Root - it is edible but very fibrousy[144]. Mucilaginous, without very much flavour[144].

tcanta FibreA fibre from the bark is used for making cords and rope[178, 272].

dwatta Antiphlogistic Demulcent Depurative Expectorant FebrifugeThe leaves are anodyne, antidotal, demulcent, expectorant and refrigerant[218]. With the flowers, they are applied to burns, swellings and other skin problems[147, 218, 240]. The flowers are antiphlogistic, depurative, febrifuge, pulmonary and stimulant[147, 240]. A decoction is used in the treatment of lung ailments[218, 240].

nrakta E. Asia - China, Japan. ksacta Thickets in S. Japan[58].

propta Seed - sow early spring in a warm greenhouse. Germination is usually fairly rapid. Prick out the seedlings into individual pots when they are large enough to handle. If growing them as annuals, plant them out into their permanent positions in early summer and protect them with a frame or cloche until they are growing away well. If hoping to grow them as perennials, then it is better to grow them on in the greenhouse for their first year and to plant them out in early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Overwinter them in a warm greenhouse and plant out after the last expected frosts.

nwatta Prefers a well-drained humus rich fertile soil in full sun[200]. Prefers a warm but wet winter[260]. This species is not very hardy in Britain, it is frost-tender and top growth will be killed by even a slight frost. However, the roots are somewhat hardier and the plant can resprout from the base after a few degrees of frost[200, 260]. The plant can probably be grown outdoors in the mildest areas of the country especially if given a good mulch in the winter. It is widely cultivated in tropical and occasionally in temperate areas as an ornamental plant, there are many named varieties[200].

#### 8.2.233 Musa basioo

Japanese Banana

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

drutta Musa basjoo is an evergreen Perennial growing to 3 m (9ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: NectarEdible Uses: The nectar of the flowers is sweet and drinkable[183].

tcanta FibreA fibre is obtained from the leaf stems[1, 11, 61]. Used for cloth, sails etc[46, 134]. The fibre can also be used for making paper[189] The leaves are harvested in summer and are soaked in water for 24 hours prior to cooking. The fibres are cooked for 2 hours with lye and then beaten in a ball mill for 4½ hours before being made into paper[189].

dwatta Diuretic Febrifuge SialagogueThe roots are diuretic, febrifuge and sialagogue[147]. A decoction is used in the treatment of beriberi, constipation, jaundice, dropsy, restlessness due to heat, leucorrhoea and croton bean poisoning[147, 218]. The leaves are diuretic[218].

nrakta E. Asia - Japan. ksacta Not known

propta Seed - best sown as soon as it is ripe in a warm greenhouse[134]. The seed usually germinates rapidly. Presoak stored seed for 72 hours in warm water, if it is still floating then it is not viable. Sow in a warm greenhouse in spring, planting one large seed in each pot. Germination usually takes place within 2 - 24 weeks at 22°c[134]. Grow the plants on in the greenhouse for at least 3 years before trying them outdoors. The seed remains viable for 2 years[134]. Removal of suckers as the plant comes into growth in spring.

nwatta Industrial Crop: Fiber Management: Managed Multistem Regional CropRequires a rich soil and a sunny sheltered position[11, 166, 200]. The large leaves are very easily torn by the wind[233]. This species is only hardy in the milder areas of Britain and even there will require protection in colder winters[1]. It thrives and fruits in south-western Britain[11, 59] where it survived the very severe winters of 1985 to 1987[K]. Plants are herbaceous and die down after flowering, forming new shoots from the roots. Cultivated in Japan as a fibre plant[11].

#### 8.2.234 Morus macroura

Himalayan Mulberry

7 tlin 10 cvuc 2 kcak 0 tcan 1 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Morus macroura is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to May, and the seeds ripen from July to August. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Dry and insipid[146]. Sweetish [183] when fully ripe[158, 272]. The yellowish-white fruit is 6 - 12cm long[266].

tcanta Dye Fibre WoodThe plant is used for paper making[266]. No further details are given, but it is almost certainly the bark that is used as the source of fibre[K]. A colour is distilled from the wood and leaves[266]. Wood - hard, close grained with a beautiful lustre. Used for furniture, construction etc1146, 2721.

dwatta AstringentThe juice of the bark is applied to cuts and wounds[272].

nrakta E. Asia - S. China to the Himalayas and Burma. ksacta Forests in the mountains of Szechwan [109]. Open hill-sides at elevations of 1000 - 2000 metres in Nepal [272].

propta The seed germinates best if given 2 - 3 months cold stratification[80, 98]. Sow the seed as soon as it is ripe if possible, otherwise in February in a cold frame. The seed usually germinates in the first spring, though it sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the cold frame for their first winter. Plant them out in late spring or early summer after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame. Plant out in spring. A good percentage take, though they sometimes fail to thrive[78, 113]. Cuttings of mature wood of the current season's growth, 25 - 30cm with a heel of 2 year old wood, autumn or early spring in a cold frame or a shady bed outside[78, 113, 200]. Bury the cuttings to threequarters of their depth. Lavering in autumn[200].

nwatta Prefers a warm well-drained loamy soil in a sunny position[1, 11]. Not very hardy in the colder parts of Britain, it tolerates temperatures down to between -5 and

1391

klwis hpa7tmwatli xre7t hjonli the flowers is sweet and drinkable[183].

but fruits are much more likely to be produced when the plants are grown in a sunny position[200, 219]. Not fully hardy in Britain, it is probably hardier than the closely related H. coriacea, tolerating temperatures down to about -15°c[184] but it can be damaged by prolonged periods below -5°c[200]. Plants are hardy at Kew but they do not fruit freely in this country[11]. Hand pollination would probably help[11, 166], fruits are more likely to form in hot summers[166]. There is also some doubt as to whether the plants are monoecious or dioecious, it would be best to grow at least two distinct plants (not cuttings from one plant) and make sure that male and female flowers are present[K]. The flowers are sweetly and heavily scented. The males are produced on the previous years wood whilst females are produced on the current years wood[182]. Plants are fast growing[200] and climb by means of twining[182]. This genus is closely related to Stauntonia spp[200].

#### 8.2.230 Pinus muricata

Bishop's Pine 7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli frusflatprikhsom hpa7tmwatli dyat hjonli

drutta Pinus muricata is an evergreen Tree growing to 20 m (65ft) by 6 m (19ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in June, and the seeds ripen from January to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils and can grow in very acid and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista The wood, sawdust and resins from various species of pine can cause dermatitis in sensitive people[222]. kcakta Edible Parts: SeedEdible Uses: CondimentSeed

- raw or cooked[257]. They can be dried and stored for later use[257]. A vanillin flavouring is obtained as a by-product of other resins that are released from the pulpwood[200].

tcanta Adhesive Dve Herbicide Shelterbelt Waterproofing WoodA very fast growing tree, even in exposed maritime areas, it makes a very good shelterbelt[75, 200]. Trees in a very exposed position at Rosewarne in N. Cornwall reached 10m in 29 years[75]. A tan or green dye is obtained from the needles[168]. The needles contain a substance called terpene, this is released when rain washes over the needles and it has a negative effect on the germination of some plants, including wheat[201]. Oleo-resins are present in the tissues of all species of pines, but these are often not present in sufficient quantity to make their extraction economically worthwhile 641. The resins are obtained by tapping the trunk. or by destructive distillation of the wood[4, 64]. In general, trees from warmer areas of distribution give the higher yields[64]. Turpentine consists of an average of 20% of the oleo-resin[64] and is separated by distillation[4, 64]. Turpentine has a wide range of uses including as a solvent for waxes etc. for making varnish, medicinal etc[4]. Rosin is the substance left after turpentine is removed. This is used by violinists on their bows and also in making sealing wax, varnish etc[4]. Pitch can also be obtained from the resin and is used for waterproofing, as a wood preservative, adhesive etc[257]. The roots have been used in making baskets[257]. Wood heavy, coarse-grained, weak, usually containing a number of knots[229]. Of little value commercially[229], though it is occasionally manufactured into lumber[82].

dwatta Antiseptic Diuretic Pectoral Poultice VermifugeThe turpentine obtained from the resin of all pine trees is antiseptic, diuretic, rubefacient and vermifuge[4]. It is a valuable remedy used internally in the treatment of kidney and bladder complaints and is used both internally and as a rub and steam bath in the treatment of rheumatic affections[4]. It is also very beneficial to the respiratory system and so is useful in treating diseases of the mucous membranes and respiratory complaints such as coughs, colds, influenza and TB[4]. Externally it is a very beneficial treatment for a variety of skin complaints, wounds, sores, burns,

boils etc and is used in the form of liniment plasters, poultices, herbal steam baths and inhalers[4].

nrakta South-western N. America - California. ksacta Found in 7 scattered locations on exposed bluffs and headlands, often drenched by salt spray[11, 200].

propta It is best to sow the seed in individual pots in a cold frame as soon as it is ripe if this is possible otherwise in late winter. A short stratification of 6 weeks at 4°c can improve the germination of stored seed[80]. Plant seedlings out into their permanent positions as soon as possible and protect them for their first winter or two[11]. Plants have a very sparse root system and the sooner they are planted into their permanent positions the better they will grow[K]. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm[200]. We actually plant them out when they are about 5 - 10cm tall. So long as they are given a very good weed-excluding mulch they establish very well[K]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Cuttings. This method only works when taken from very young trees less than 10 years old. Use single leaf fascicles with the base of the short shoot. Disbudding the shoots some weeks before taking the cuttings can help. Cuttings are normally slow to arow away[81]

nwatta Thrives in a light well-drained sandy or gravelly loam[1, 11]. Dislikes poorly drained moorland soils[1]. Established plants tolerate drought[200] and are very resistant to maritime exposure[185]. Mature trees produce a broad heavy crown and are somewhat likely to be blown down in severe gales[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°c[200]. It grows quickly on barren acidic sandy soils[81], with annual growths of 1.8 metres being recorded for young trees[185]. Trees from the northern provenances maintain rapid height growth for longer than trees from the southern provenances, but both remain vigorous in girth[185]. Trees grow larger in cultivation than they do in the wild[200]. The cones are about 8cm long, they remain on the tree and retain viable seed for up to 25 years, opening up and scattering the seed after a forest fire[11, 82]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200]. They hybridize freely with other members of this genus[200]. Leaf secretions inhibit the germination of seeds, thereby reducing the amount of plants that can grow beneath the tree[18]. Plants in this genus are notably susceptible to honey fun-

#### 8.2.231 Atriplex serenana

Bractscale, Davidson's bractscale 7 tlin 10 cyuc 2 keak 0 tean 0 dwat 3 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli hjonli

drutta Atriplex serenana is a ANNUAL growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen from August to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate droudth. The plant can tolerate maritime exposure.

pcista No member of this genus contains any toxins, all have more or less edible leaves. However, if grown with artificial fertilizers, they may concentrate harmful amounts of nitrates in their leaves.

kcakta Edible Parts: Leaves SeedEdible Uses: CondimentLeaves and young plants - cooked. They are usually boiled with other foods as a salty flavouring[161, 177, 257]. Seed - cooked. Used in piñole or ground into a meal and used as a thickener in making bread or mixed with flour in making

nrakta South-western N. America - California. ksacta Alkaline valleys, marshy areas, valley grasslands, coastal sage scrub, sometimes as a ruderal weed at elevations of 70 - 1300 metres (71, 270). drutta Prunus caroliniana is an evergreen Shrub growing to 12 m (39ft 4in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista The leaves and young branches of this species contain considerable quantities of hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death.

kcakta Edible Parts: Fruit SeedEdible Uses: The fruit might be edible[105]. It has a thick skin and a thin dry flesh[82] and is not edible[227]. It is slightly toxic to humans[229]. The fruit is about 13mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta Dye Hedge Hedge Shelterbelt WoodAmenable to trimming, this plant can be grown as a screen and hedge[82, 227]. It can also be used in shelterbelt plantings[200]. A green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]. Woodhard, heavy, strong, close grained[82]. The trees are seldom large enough for the wood to be exploited commercially[229].

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

nrakta South-eastern N. America - North Carolina to Florida, west to Texas. ksacta Deep, well-drained rich moist bottomlands. bluffs or streambanks[82, 229].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Landscape Uses: Pest tolerant, Screen, Standard, Street tree, Woodland garden. Requires a well-drained moisture retentive soil[11, 200]. Succeeds in a hot dry position. Succeeds in light shade but fruits better in a sunny position[11, 200]. Thrives in a loamy soil, doing well on limestone[11, 200]. Prefers some chalk in the soil but apt to become chlorotic if too much is present[11]. Fairly windresistant[200]. One report says that this species is tender in most of Britain[11], whilst another says that it succeeds in climatic zone 7 (tolerating frosts down to about -15°c)[200]. A fast-growing but short-lived tree[229]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features:North American native, Naturalizing, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

#### 8.2.178 Arbutus xalapensis

Madrono, Texas madrone 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 12 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flat hpa7tmwatli fyifxre7t hjonli

drutta Arbutus xalapensis is an evergreen Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower

from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[161,

nrakta South-western N. America - Mexico. ksacta Drier oak forests from Sinaloa, Chihuahua and Nuevo Leon southwards. Usually found on limestone soils at elevations up to 3,000 metres[260].

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse[78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at  $20^{\circ}c[134]$ . Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. Basal cuttings in late winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of young wood - can take 2 years[1, 200].

nwatta Requires a lime-free nutrient-rich well-drained moisture-retentive soil in sun or semi-shade and shelter from cold drying winds, especially when young[200]. This species thrives on limestone soils and in dry conditions[260]. Plants are not very hardy in the colder areas of the country, tolerating temperatures down to about -10°c[200].

### 8.2.179 Vitis girdiana

Valley Grape, Desert wild grape
7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 12 m hkuc
hmimhtut cyutli kyuctcup hwicii hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli yre7t hionli

drutta Vitis girdiana is a deciduous Climber growing to 12 m (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit raw or dried for winter use[161, 177, 257]. The fruit is about 4 - 7mm in diameter[200] and is carried in bunches. Young leaves are wrapped around other foods and then baked, they impart a pleasant flavour. Young tendrils - raw or cooked.

tcanta Dye HairA yellow dye is obtained from the fresh or dried leaves[168]. The sap has been rubbed on falling or thin hair to keep it healthy and make it grow[257].

nrakta South-western N. America - California, Baja California. ksacta Canyon bottoms along the sides of streams etc, below 1200 metres[71].

propta Seed - best sown in a cold frame as soon as it is ripe[K]. Six weeks cold stratification improves the germination rate, and so stored seed is best sown in a cold frame as soon as it is obtained. Germination should take place in the first spring, but sometimes takes another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant out in early summer. Cuttings of mature wood of the current seasons growth, December/January in a frame. These cuttings can be of wood 15 - 30cm long or they can be of short sections of the stem about 5cm long with just one bud at the top of the section. In this case a thin, narrow strip of the bark about 3cm long is removed from the bottom half of the side of the stem. This will encourage callusing and the formation of roots. Due to the size of these cuttings they need to be kept in a more protected environment than the longer cuttings. Layering.

nwatta Prefers a deep rich moist well-drained moderately fertile loam[1, 200]. Grows best in a calcareous soil[200]. Succeeds in sun or partial shade though a warm sunny position is required for the fruit to ripen[200]. Plants

climb by means of tendrils[182]. Any pruning should be carried out in winter when the plants are dormant otherwise they bleed profusely[182, 200]. Plants in this genus are notably susceptible to honey fungus[200].

### 8.2.180 Ipomoea alba

Moonflower, Tropical white morning-glory
7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 10 m hkuc
htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis
hpa7tmwatli xre7t hjonli

drutta Ipomoea alba is an evergreen Perennial Climber growing to 10 m (32ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Leaves SeedEdible Uses: Young leaves and fleshy calyces - cooked. Steamed and eaten as a vegetable or used in curries, soups, stews etc[183]. They can also be dried for later use[183]. Seed - eaten when young[183].

dwatta The whole herb is used in treating snakebite[266].

nrakta Pantropical. ksacta Wet forests, watercourses and disturbed areas in China[266].

propta Pre-soak the seed for 12 hours in warm water, or early the seed, and sow in individual pots in a greenhouse in early spring. The seed usually germinates in 1 - 3 weeks at 22°c. Plants are extremely resentful of root disturbance, even when they are quite small, and should be potted up almost as soon as they germinate[219]. Grow them on in the greenhouse for at least their first winter then plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of side shoots in a peaty soil. Layering. Plants form tubercles on their stems[260]. These can be stored overwinter in a slightly moist medium such as sand or leafmould, keeping them in a cool but frost-free place. Pot them up in early spring.

nwatta Requires a fertile well-drained loam in a warm sunny position[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Another report says that plants need a minimum temperature of 5°c if they are to overwinter successfully[260]. A short-lived perennial or biennial species[187]. A fast-growing climbing plant, it is best grown as a temporary screen in the garden or along the boundary edge[200]. Plants need a long period of growth to reach flowering size and so are not very suitable for growing in pots in a greenhouse[260]. A climbing plant, supporting itself by twining around the branches of other plants[219]. The plant forms tubercles (baby tubers) on the stems and can be propagated by them[260]. The aromatic flowers open of a night time[188].

#### 8.2.181 Torreya jackii

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Torreya jackii is an evergreen Tree growing to 10 m (32ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed[81]. No more details are given but it is likely that the seed can be eaten raw or cooked and is rich in oil. An edible oil is obtained from the seed[105, 177].

tcanta Incense Oil WoodThe leaves are very aromatic when bruised or burned, giving off a fragrance like sandal-wood oil[266]. The wood is very fragrant, and is used to make agricultural implements, utensils, and handicrafts[266].

nrakta E. Asia - E. China. ksacta Woods at elevations of 400 - 1000 metres in N Fujian, NE Jiangxi S Zhejiang provinces[266].

propta Seed - best sown as soon as it is ripe in a cold frame. Some of the seed should germinate in the following spring though much of it might take another 12 months. Stored seed requires a period of cold stratification and can take 18 months or more to germinate. Prick out the seedlings into individual pots as soon as growth is observed and grow them on in light shade in the greenhouse for at least the next couple of winters, making sure to pot them on into larger pots as and when required. Plant them out into their permanent positions in early summer when the plants are at least 20cm tall. Cuttings of half-ripe shoots in late summer[1]. Cuttings do not grow well[11]. Layering.

nwatta Succeeds in ordinary garden soil, tolerating some lime[1]. Requires a sheltered position and either high humidity or a moist riverside soil[200]. Dislikes wind exposure[200]. Tolerates woodland shade very well[200]. Requires hot, very humid summers for best growth[200]. Quite rare in the wild, this is a vulnerable species at risk of becoming extinct in the wild[266]. Torreya jackii is unlike the other Chinese members of the genus and is remarkably similar to Cephalotaxus fortunei, from which it can be distinguished by its sessile seed-bearing structures and by the peculiar, strongly twisted leaf arrangement[266]. The seed takes two summers to mature[229]. This species is not very hardy in Britain, though trees can be grown outdoors in the milder parts of the country[81]. Plants are dioecious, but sometimes monoecious with dioecious branches. Male and female plants must usually be grown if seed is required.

### 8.2.182 Muehlenbeckia australis

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Muehlenbeckia australis is an evergreen Climber growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Sweet and juicy[173].

nrakta New Zealand. ksacta Scrub and forests, especially marginal, up to montane altitudes on Three Kings, North, South, Stewart and Chatham Islands[44, 173].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8 cm with a heel, July/August in a frame. Pot up in autumn and overwinter in a cold frame. High percentage[78]. Plant out in late spring. Cuttings of mature wood of the current season's growth, 5 - 10cm with a heel, October/November in a cold frame. High percentage[78].

nwatta Requires a well-drained soil in sun or semishade[200]. Not very hardy in Britain[182]. Plants tolerate temperatures down to between -5 and -10°c[200]. A climbing plant that supports itself by twining around other plants etc[219]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.183 Liquidambar orientalis

Oriental Sweet Gum 7 tlin 10 cyuc 2 koak 0 tcan 3 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli nrakta South-eastern N. America - Florida. ksacta The elevated central lands of Florida in dry sandy soils that have a supply of water at depth, as part of the understorey in sand pine and oak scrub communities[231].

propta Seed - best sown as soon as it is ripe in a warm greenhouse at not less than  $24^{\circ}c[188]$ . Stored seed is very slow to germinate. Pre-soaking the seed for 24 hours in warm water prior to sowing may shorten the germination time. Plants form a long tap-root some time before forming a shoot. Germination of fresh seed usually takes place in 3-4 months at  $25^{\circ}c[138]$ . As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving them some protection from the cold for at least their first winter outdoors.

nwatta Succeeds in most fertile moist but well-drained soils in a sheltered sunny position[188, 200, 231]. Although it prefers a humid atmosphere, this species is tolerant of arid atmospheres so long as it has plenty of moisture available at the roots[231]. This palm tolerates short-lived freezes down to about -10°c and can be grown outdoors in the very mildest areas of the country[231]. Palms usually have deep penetrating root systems and generally establish best when planted out at a young stage. However, older plants are substantially more cold tolerant than juvenile plants[231]. In areas at the limit of their cold tolerance, therefore, it is prudent to grow the plants in containers for some years, giving them winter protection, and only planting them into their permanent positions when sheer size dictates[231]. This species can also be transplanted even when very large. Although the thick fleshy roots are easily damaged and/or desiccated, new roots are generally freely produced. It is important to stake the plant very firmly to prevent rock, and also to give it plenty of water until re-established - removing many of the leaves can also help[231]. Plants are very slow-growing when young and take a considerable time to establish[231].

### 8.2.227 Decaisnea insignis

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 3.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Decaisnea insignis is a deciduous Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower in June, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[1, 105, 177]. A yellow pod about 8cm long[200], it is filled with a white juicy pulp that is very sweet and pleasant to eat[2]. nrakta E. Asia - Himalayas in Sikkim and Bhutan. ksacta Moist woods and thickets to 3000 metres[109, 146].

propta Seed - best sown as soon as it is ripe in a cold frame[200], it then usually germinates freely in early spring[K]. Sow stored seed in February in a greenhouse. This usually germinates well, within 1 - 3 months at 18°c[175]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on under protection for their first winter. Plant out in late spring after the

last expected frosts. Cuttings.

mwatta Prefers a rich moist loamy soil and a sunny position sheltered from cold winds[1, 175]. Succeeds in partial
shade[200]. This species is not very hardy in Britain[11], it
probably needs greenhouse protection in most parts of the
country[1]. The flowers and young growth in spring are very
frost-tender and can be damaged by late frosts[200]. The
flowers are produced at the tips of the new upright growths
in the spring[11, 2021.

#### 8.2.228 Salvia microphylla

Blackcurrant Sage 7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia microphylla is an evergreen Perennial growing to 1.2 m (4ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves have a pleasant scent of blackcurrant and can be used fresh or dried as a flavouring. A herbal tea, called 'mirot de montes', is made from the leaves[260].

dwatta FebrifugeAn infusion of the flowers and leaves have been used in the treatment of fevers[238].

nrakta Southern N. America - Mexico to Guatemala. ksacta Not known

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a warm sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. This species is rather variable with a number of sub-species and cultivars of differing hardiness[200, 260]. The hardiest forms tolerate temperatures down to about -10°c[260] and can be grown outdoors in the mildest areas of the country, though they are probably best grown in a cold greenhouse. When grown outdoors, the top growth will be cut back to the ground in cold winters but, if the roots are given a good mulch in the autumn, plants will often survive the winter outdoors and resprout freely from the base in the spring[200]. The flowers are very attractive to bees, providing a good source of nectar[61]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 8.2.229 Holboellia angustifolia

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Holboellia angustifolia is an evergreen Climber. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177]. Often considered to be insipid, it is a startling metallic-blue colour, sausage-shaped with many black seeds in the white pulp. The fruit can be up to 8cm long and 5cm wide[266].

dwatta The roots and stems are used medicinally[266].

nrakta E. Asia - Himalayas to C. China. ksacta Scrub and gorges, 600 - 1800 metres in W. Hubei. Mixed forest on mountain slopes, edge of forests, hillsides, along valleys and by streams at elevations of 1000 - 2700 metres

propta Seed - we have no details on this species but suggest sowing the seed as soon as it is ripe if this is possible, otherwise as soon as you obtain it, in a warm greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of softwood[1]. Cuttings of half-ripe wood in late summer or autumn[188]. Layering.

nwatta Easily grown in any fertile soil in sun or part shade[182, 200]. Plants grow best on a shady wall or when grown into a tree[200]. They succeed in sun or deep shade,

suckers in late spring and plant out in their permanent position 12 months later.

nwatta Requires a rich moist but well-drained soil in a sunny sheltered position[188, 231], especially from the cold drying winds of the north and east[11]. Individual leaves live for about 3 years and, if they are damaged by wind will make the plant look very shabby as well as reducing its potential for photosynthesis[231]. Hardy in the southern part of Britain, tolerating frosts down to between -5 and -10°c if the plant is sheltered from cold winds[200, 260]. Young plants require protection during winter[11]. Palms usually have deep penetrating root systems and generally establish best when planted out at a young stage. However, older plants are substantially more cold tolerant than juvenile plants[231]. In areas at the limit of their cold tolerance, therefore, it is prudent to grow the plants in containers for some years, giving them winter protection, and only planting them into their permanent positions when sheer size dictates[231]. Palms can also be transplanted even when very large. Although the thick fleshy roots are easily damaged and/or desiccated, new roots are generally freely produced. It is important to stake the plant very firmly to prevent rock, and also to give it plenty of water until re-established - removing many of the leaves can also help[231]. Very closely related to T. fortunei, one of the main differences being that, unlike T. fortunei, the fibres from the leaf stalks do not persist on this species[231]. The plant is also slower growing, though it is eventually much taller than T. fortunei[260]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.224 Liriope minor

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Liriope minor is an evergreen Perennial growing to  $0.3\ m$  (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: The following use is reported for L. graminifolia, but there is a lot of confusion between members of this genus (compare [58] and [200]) and it is quite possible that the root of this species is also used[K]. Root - cooked[105, 177, 179]. Candied and used medicinally[61]. The root has a fleshy, tuberous part near tip[266]. Rich in mucilage, the root also contains about 1.6% protein, 0.5% fat, 80% carbohydrate and 2.3% ash[179].

tcanta A good drought tolerant evergreen ground cover plant[200].

dwatta Aphrodisiac Pectoral StimulantThe root is aphrodisiac, pectoral and stimulant[61].

nrakta E. Asia - China, Japan. ksacta Lowland and foothills all over Japan[58]. Forests, shady hillsides and grassy slopes at elevations of 600 - 2600 metres[266].

propta Seed - we have no information on this species but suggest sowing it in a cold frame or greenhouse as soon as the seed is ripe if possible, if not then sowing the stored seed in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a sandy soil[1]. Succeeds in full sun so long as the soil does not dry out in the summer, otherwise it should be grown in partial shade in any moderately fertile well-drained soil[200]. Not very hardy in Britain, it is best to give the plants some protection in the winter[1]. Closely related to L. muscari[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 8.2.225 Bolax gummifera

Bolax

7 tlin 8 cyuc 2 kcak 0 tcan 1 dwat m hkuc htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Bolax gummifera is an evergreen Perennial at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: RootEdible Uses: Root - raw or roasted[69].

tcanta Plants can be used for ground cover, forming a very dense carpet of growth[208].

dwatta Antispasmodic DeobstruentAn oleo-resin obtained from incisions made at the base of the main stem is antispasmodic and deobstruent[4].

nrakta Southern S. America ksacta Cliffs and rocks, open scrub and heath, forest margins and clearings, feldmark, to 900 metres[69].

propta Seed - it may be best to sow the seed as soon as it is ripe in a greenhouse and plant out in late spring. Stored seed should be sown in late winter in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division of rooting rosettes in the summer[188]

nwatta Landscape Uses:Container, Ground cover, Massing, Rock garden. Requires a position in full sun in a well-drained gritty humus-rich soil[188, 200]. A cushion plant up to 1.2m in diameter[69], it is often included in the genus Azorella[188]. Plants rarely flower in cultivation[188]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

#### 8.2.226 Sabal etonia

Scrub Palmetto

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sabal etonia is an evergreen Shrub growing to 3 m (9ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta The fruit is a small dry berry with a thin sweet flesh[229]. The fruit is up to 13mm long and 15mm wide, with a seed up to 6.7mm long and 10mm wide[270]. Although we have seen no records of edibility for this species, the following uses are for the related S. palmetto. They quite probably also apply here[K]. Fruit - raw or cooked[2]. Sweet and pleasant[2]. A nourishing food, though it is said to be an acquired taste[2]. The fruit is up to 12mm long and 3mm wide[200]. Young leaves - raw or cooked. An excellent food[2]. Sap - sweet[2].

tcanta Fibre TanninThe following reports are for S. palmetto. They quite probably also apply to this species[K]. An excellent fibre is obtained from the leaf stalks[171]. The best quality is from young leaf stalks still in the bud, whilst coarser material is obtained from older leaves or the bases of old leaf stalks surrounding the bud[171]. The fibres are up to 50cm long, they are harvested commercially and used to make brushes, especially where these have to remain stiff in hot water or caustics[171]. The roots contain tannin[171].

drutta Liquidambar orientalis is a deciduous Tree growing to 10 m (32ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower in May, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: GumA chewing gum and a stabilizer for cakes etc are obtained from the resin[177]. This resin is also used to flavour baked foods etc[183].

tcanta Gum Incense Parasiticide Resin WoodThe aromatic resin 'Storax' is obtained from the trunk of this tree[57, 64]. It forms in cavities of the bark and also exudes naturally. It is harvested in autumn. Production can be stimulated by beating the trunk in the spring[171, 238]. The resin has a wide range of uses including medicinal, incense, perfumery, soaps etc. It is also used as a parasiticide[46, 61]. Liquid storax gives greater permanence to the odours of flowers extracted by maceration[245]. It is also used in the imitation of other scents as an alternative to vanilla, ambergris and benzoin, or to complement them[245]. The aromatic bark is burnt as an incense[245].

dwatta Antibacterial Antidote Antiinflammatory Parasiticide Pectoral Salve Stimulant VulneraryA resin obtained from the wood and inner bark acts both as an irritant and an expectorant within the respiratory tract. It is one of the ingredients of 'Friar's Balsam', an expectorant mixture that is inhaled to stimulate a productive cough[254]. Externally it is applied to the skin to treat a range of diseases [254]. The resin is also mixed with Hamamelis virginiana and Rose water to make an astringent face lotion[254]. The resin is antibacterial, anti-inflammatory, antiseptic, expectorant, pectoral, salve and stimulant[46, 57, 61, 176, 218, 238]. It is taken internally in the treatment of strokes, infantile convulsions, coma, heart disease and pruritis[238]. It is also used in the treatment of cancer[218]. Externally it is mixed with oil and used to treat scabies, wounds, ulcers etc[238, 254]. The bark is harvested in the autumn and the resin extracted from the bark[254]. The leaves, fruits and roots are used in similar ways to the resin[238] and are also considered to be antidote, parasiticide and vulnerary[218].

nrakta W. Asia. ksacta Flood plains, marshy places and valley sides near streams to elevations of 1800 metres in Turkev[93].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. Harvest the seed capsules at the end of October or November, dry in a warm place and extract the seed by shaking the capsule. Stored seed requires 1 - 3 months stratification and sometimes takes 2 years to germinate. Sow it as early in the year as possible. Germination rates are often poor. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame or greenhouse for their first winter. Since they resent root disturbance, it is best to plant them out into their permanent positions in early summer of their second year and give them some protection from cold for their first winter outdoors[K]. Cuttings of half-ripe wood, July/August in a frame. Suckers in early spring. Layering in October/November. Takes 12 months.

nwatta Prefers a moist but not swampy loam in a sheltered position[1, 200]. Prefers a neutral to acid soil[130]. Grows poorly on shallow soils overlying chalk[188]. Plants can be grown in full sun so long as the soil is not dry hungry and shallow[130]. Young plants are susceptible to damage from late frosts[11, 130, 200]. Mature plants are fully hardy but prefer a hotter climate if they are to do well[11]. Plants rarely, if ever, flower in Britain[11]. They rarely flower in climatic zones colder than zone 7[200]. An aromatic gum exudes from the trunk. The fragrance is also present to some extent in the leaves, especially if they are bruised[245]. This species resents root disturbance, young plants should be potgrown and be placed in their permanent positions as soon as possible[200]. A slow growing plant[1].

### 8.2.184 Docynia delavayi

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Docynia delavayi is an evergreen Tree growing to 10 m (32ft) by 10 m (32ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw, cooked or used in preserves[177]. When ripe it is like an apple[183]. The fruit is about 4cm in diameter[200].

tcanta Fruit ripeningThe fruits of this plant are used to promote the ripening of persimmons, Diospyros kaki. The fruits of each species are placed in alternate layers in a large container, they are then covered with rice husks and in 10 hours the persimmons are ready for eating[61, 105, 183].

nrakta E. Asia - China. ksacta Riversides in valleys, mixed forests and mountainous areas at elevations of 1000 - 3000 metres in W Guizhou, W Sichuan and NW Yunnan Provinces[266].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Requires a well-drained soil in a sunny position[200]. This species is only hardy in the milder areas of Britain[1], it succeeds outdoors at Wisley just west of London[11]. The genus is closely related to the quince, Cydonia oblonga[200].

### 8.2.185 Arbutus canariensis

Canary Madrona

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Arbutus canariensis is an evergreen Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta Edible Parts: FruitEdible Uses: The fruit is made into a sweetmeat[2, 183].

nrakta Canary Isles. ksacta Not known

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse[78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at 20°c[134]. Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. Basal cuttings in late winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of young wood - can take 2 years[1, 200].

nwatta Requires a lime-free nutrient-rich well-drained moisture-retentive soil in sun or semi-shade and shelter from cold drying winds, especially when young[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200].

### 8.2.186 Cornus chinensis

7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Cornus chinensis is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from February to March, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: The following notes refer to the closely related species C. officinalis, they probably also apply to this species[K]:- Fruit - raw or cooked[105, 177]. The fully ripe fruit is quite pleasant but slightly astringent[K]. It is about 1.5cm long[200]. The fruit contains about 8.6% sugars, 2.9% malic acid, 0.74% ash[179].

dwatta Antibacterial Antifungal Antiperiodic Antiseptic Antitumor Astringent Diuretic Hepatic Hypotensive Malaria Tonic UrinaryThe fruit is used medicinally for similar treatments as Cornus officinalis[266]. These are:- Shan Zhu Yu has been used for at least 2,000 years in Chinese herbal medicine. It is a herb that "stabilizes and binds" and is used principally to reduce heavy menstrual bleeding and unusually active secretions including copious sweating, excessive urine, spermatorrhoea and premature ejaculation[147, 238, 254]. Like all herbs that suppress bodily fluids (even excessive ones), it will simply prolong or lead to a worsening of symptoms if it is used without tonic or detoxifying herbs[254]. It is, therefore, normally used in combination with herbs such as Rehmannia glutinosa and is an ingredient of the "Pill of eight ingredients" which is used in China to "warm up and invigorate the yang of the loins" [254]. The fruit is antibacterial, antifungal, hypotensive, antitumor, astringent, diuretic, hepatic and tonic[116, 147, 176, 178, 238]. The fruit, without the seed, is decocted for the treatment of arthritis, fever and a wide range of other ailments[218]. It is used in the treatment of senile lumbago, diabetes, cystitis, tinnitus etc[174, 254]. The fruit has an antibacterial action, inhibiting the growth of Bacillus dysenteriae and Staphylococcus[176]. The fruit is harvested when fully ripe and is dried for later use[238]. The stem bark is astringent, antimalarial and tonic[218]. The plant is antibacterial, diuretic, hypotensive and a urinary antiseptic[218].

nrakta E. Asia - C. and S. China. ksacta Slopes, margins of mixed forests and dense forests at elevations of 700 - 2500, occasionally to 3500 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame or in an outdoors seedbed if there is sufficient seed[80, 1131. The seed must be separated from the fruit flesh since this contains germination inhibitors[80, 164]. Stored seed should be cold stratified for 3 - 4 months and sown as early as possible in the year[164]. Scarification may also help as may a period of warm stratification before the cold stratification[80, 164]. Germination, especially of stored seed, can be very slow, taking 18 months or more[164]. Prick out the seedlings of cold-frame sown seeds into individual pots as soon as they are large enough to handle and grow the plants on for their first winter in a greenhouse, planting out in the spring after the last expected frosts. Cuttings of half-ripe side shoots, July/August in a frame. Cuttings of mature wood of the current year's growth, taken with a heel if possible, autumn in a cold frame. High percentage [78]. Layering of new growth in June/July. Takes 9 months[78].

nwatta An easily grown plant, it succeeds in any soil of good or moderate fertility[1], ranging from acid to shallow chalk[200]. Grows well in heavy clay soils. Succeeds in full sun or light shade[[188]. Prefers semi-shade[219]. Plants are not very cold-tolerant, they succeed outdoors only in the milder areas of the country where winter temperatures do not fall below about -5°c[11, 200]. A specimen growing in a fairly open sunny position at Kew Gardens in April 1999 was about 10 years old and 2 metres tall. It had no sign of flowers, though it is obviously more cold hardy than believed since it has already tolerated temperatures rather lower than 5°c[K]. This species is very closely related to C. mas and C. officinalis, differing mainly in having black instead of red fruit[11, 200]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.187 Corvlus ferox

Himalayan Hazel, Tibetan hazelnut

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 10 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli hjonli

drutta Corylus ferox is a deciduous Tree growing to 10 m (32ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw or cooked[146, 177, 272]. Small with a thick shell, the seed atsets like the common filbert, C. maxima[2, 183]. The seed ripens in mid to late autumn and will probably need to be protected from squirrels[K]. When kept in a cool place, and not shelled, the seed should store for at least 12 months[K]. An edible oil is obtained from the seed.

tcanta Oil WoodWood - soft, even grained[146].

nrakta E. Asia - Himalayas from C. Nepal to S.W. China. ksacta Forests, 2400 - 3000 metres in the Himalayas[51]. Forests on mountain slopes at elevations of 1500 - 3800 metres in western China[266].

propta Seed - best sown as soon as it is harvested in autumn in a cold frame[164]. Germinates in late winter or spring. Stored seed should be pre-soaked in warm water for 48 hours and then given 2 weeks warm followed by 3- 4 months cold stratification[164]. Germinates in 1- 6 months at  $20^{\circ}c[164]$ . When large enough to handle, prick the seedlings out into individual pots and grow them on in a cold frame or sheltered place outdoors for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Layering in autumn. Easy, it takes about 6 months[78, 200]. Division of suckers in early spring. Very easy, they can be planted out straight into their permanent positions.

nwatta An easily grown plant, it succeeds in most soils, but is in general more productive of seeds when grown on soils of moderate fertility[11, 200]. It does less well in rich heavy soils or poor ones[11, 63]. Does well in a loamy soil[11]. Very suitable for an alkaline soil[11], but it dislikes very acid soils[17]. Plants are fairly wind tolerant[1, 11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Members of this genus bear transplanting well and can be easily moved even when relatively large[11].

### 8.2.188 Himalayacalamus hookerianus

Padano

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 9 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Himalayacalamus hookerianus is an evergreen Bamboo growing to 9 m (29ft 6in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed - cooked whole or ground into a powder and used as a cereal[214]. Plants flower at intervals of about 50 years, they flower and produce fertile seed abundantly in British gardens[214].

tcanta Basketry Soil stabilization WeavingThe older stems are harvested for weaving into baskets and mats[214]. The canes can be up to 3cm in diameter and, with the long gaps between nodes, produce a high-quality weaving material[220, 272]. A very effective plant for stabilising soil on steep slopes[267].

nrakta E. Asia - Himalayas from E. Nepal to Sikkim and Bhutan. ksacta Cool broad-leaved forests, 2000 - 2500 metres[220]. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 - 6 months. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Prefers an open loam of reasonable quality and plenty of moisture in the growing season[1]. Requires a sheltered position[25]. A very ornamental plant[1], it is only reliably hardy in the milder areas of Britain[1, 11, 25, 162], tolerating temperatures down to about -6°c. In most parts of the country it is best grown in a conservatory. This species is notably resistant to honey fungus[200]. Plants flower quite frequently in Britain and often produce viable seed[11]. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rootstock is caespitose, new shoots are produced from late Mav[25].

### 8.2.221 Neillia thyrsiflora

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Neillia thyrsiflora is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - eaten when fully ripe[272].

nrakta E. Asia - Himalayas to western China, Burma and south to Indonesia. ksacta Exposed slopes along streams at elevations of 1600 - 2100 metres in Nepal[272]. In bushes at elevations of 1000 - 3000 metres in NW Yunnan, China[266].

propta Seed - sow late winter or early spring in a warm grenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a semi-shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings in early summer[200]. Semi-ripe cuttings in the summer in a closed frame with botom heat[200]. Division of suckers in the autumn[200].

nwatta Prefers a moist, well aerated soil in a sunny or partly shaded position[200]. This species is nt very winter hardy, tolerating temperatures down to about -5 c. It succeeds outdoors in the milder areas of Britain[200]. Unlike other members of this genus, this species flowers on the current season's growth and so any pruning is best carried out in late winter or early spring[200].

### 8.2.222 Billardiera scandens

Common Appleberry 7 tlin 10 cyuc 2 kocak 0 tcan 0 dwat 3 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flat hpa7tmwatli xre7t hionli

drutta Billardiera scandens is an evergreen Climber growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105, 154]. Unripe fruits can be roasted[193]. A pleasant sub-acid flavour akin to dried apples[2, 144]. Tastes like kiwi fruits (Actinidia deliciosa)[193]. The fruits are up to 2.5cm long[193].

nrakta Australia - New South Wales, Queensland, South Australia, Tasmania, Victoria. ksacta By mountain streams or scrub country in forests, by coasts and on tablelands[154].

propta Seed - best sown in a warm greenhouse as soon as it is ripe. Only just cover the seed. Sow stored seed in early spring in a warm greenhouse. The germination of fresh seed is usually prolific, but stored seed can take a year to germinate[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10 - 12cm with a heel, July/August in a frame. Fair percentage. Layering.

nwatta Requires a moist, well-drained, humus-rich, lime-free soil in sun or semi-shade with a cool root run[200]. This species usually requires greenhouse protection in Britain[1], but plants can succeed outdoors on a wall in mild areas of the country[166]. They tolerate temperatures down to at least -7°c[157] in Australian gardens but this cannot be translated directly to British gardens because of our cooler summers and longer, colder and wetter winters.

### 8.2.223 Trachycarpus martianus

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nvanhien hionli

drutta Trachycarpus martianus is an evergreen Tree growing to 12 m (39ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Fruit- raw or cooked The flesh is scanty and almost tasteless[2]. The following notes are for the closely related T. fortunei. They almost certainly also apply to this species[K]. Young flower buds - cooked[2, 105, 178]. Used like bamboo shoots[183]. The fresh flowers and terminal bud are also apparently consumed[183].

tcanta Fibre WeavingThe following notes are for the closely related T. fortunei. They almost certainly also apply to this species[K]. The fibres from within the leafstalk are used for making brushes, ropes, coarse cloth etc[231]. A matting is made from the bark admixed with some of the stem fibres[178]. The leaves are woven into hats, rough coats and fans[46, 61, 178].

dwatta Astringent Contraceptive HaemostaticThe following notes are for the closely related T. fortunei. They almost certainly also apply to this species[K]. The flowers and the seed are astringent and haemostatic[147, 218]. The root or the fruit is decocted as a contraceptive[147, 218]. The ashes from the silky hairs of the plant are haemostatic[147, 218]. Mixed with boiling water they are used in the treatment of haemopytsis, nose bleeds, haematemesis, blood in stools, metrorrhagia, gonorrhoea and other venereal diseases[147].

nrakta E. Asia - Himalayas from Nepal to S.W. China. ksacta Found at elevations to 2,400 metres, often on limestone soils[2,31].

propta Scarify or pre-soak the seed for 24 hours in warm water then sow in a cold frame in mid to late winter. Bring into the greenhouse about 4 - 6 weeks later and the seed should germinate in about 4 - 8 weeks at 25°c[133]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving the plants some protection from the cold for at least their first winter outdoors. Pot up

pots in a greenhouse. Good percentage[78]. Suckers, removed in late winter and planted into their permanent positions[113].

nwatta Landscape Uses:Border, Massing. Prefers a good deep well-drained moisture retentive soil in full sun or semi-shade[1, 11, 200]. Plants are hardy to at least -15°c[200]. The leaves are often persistent until the following spring when the new leaves are produced[82]. Diocious. Male and female plants must be grown if seed is required. Flowers are formed on the old wood[206]. Special Features:North American native, Attracts butterflies, Inconspicuous flowers or blooms.

### **8.2.219** Vitex agnus

Agnus Castus, Lilac chastetree, Vitex, Chastetree 7 tlin 9 cyuc 2 kcak 3 tcan 5 dwat 3 m hkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Vitex agnus-castus is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf from June to October, in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista Headache, abdominal cramps and diarrhoea, increased menstrual flow, rashes, pruritus[301].

kcakta Edible Parts: Edible Uses: CondimentThe fruit is used as a condiment, it is a pepper substitute[46, 61, 100, 183]. The aromatic leaves are also used as a spice[183, 227]. This plant forms one of the ingredients of the legendary Moroccan spice mixture 'ras el hanout'[183]. Unfortunately, the seed is very unlikely to be produced in Britain[K].

tcanta Basketry Dye Essential WoodA perfume is made from the flowers[227]. Young stems are used in basket making[46, 61, 100]. A yellow dye is obtained from the leaves, the seed and the roots[100, 148]. Wood - hard, close grained[146].

dwatta Anaphrodisiac Aphrodisiac Diaphoretic Diuretic Febrifuge Galactogogue Infertility Ophthalmic Sedative Stomachic Women's complaintsAgnus castus has been used for thousands of years for its beneficial affect on the female hormonal system. Modern research has confirmed this use, the seeds being used to restore balanced functioning to the female reproductive system[254]. The seeds and fruits are anaphrodisiac, aphrodisiac, galactogogue, ophthalmic, sedative, stomachic, women's complaints[89, 148, 165]. Prolonged usage restores corpus luteum function[165]. Unfortunately, the berries are unlikely to be produced in the British climate[K]. The berries of this plant have a range of medicinal actions but possibly the most important is its ability to rectify hormonal imbalances caused by an excess of oestrogen and an insufficiency of progesterone[224]. It acts upon the pituitary gland, reducing the production of certain hormones and increasing the production of others, shifting the balance in favour of the gestagens. Thus it has a wide application of uses in malfunctions of the feminine reproductive system and has been used with great effect in restoring absent menstruation, regulating heavy periods, restoring fertility when this is caused by hormonal imbalance, relieving pre-menstrual tension and easing the change of the menopause[224]. Some caution is advised since excessive doses can cause a nervous disorder known as formication, which manifests as a sensation of insects crawling over the skin[238]. The berries are considered to be an aphrodisiac[89], though other reports say that they are anaphrodisiac[11, 46]. The reason for this apparent disagreement is that the berries have a regulating effect on the body and so are likely to increase sexual activity in those who are not very active in this area whilst reducing it in those who are very active[K]. The fresh berries are pounded to a pulp and used in the form of a tincture for the relief of paralysis, pains in the limbs, weakness etc[4]. Other uses include: reduced flatulence, suppress appetite and induce sleep. Unproven uses include: treatment of impotence, prostatitis, swelling of the testes, sterility, swelling of the ovaries[301]. Not recommended during pregnancy and

could inhibit milk production[301]. The German Commission E Monographs, a therapeutic guide to herbal medicine approve Vitex agnus-castus for premenstrual syndrome, and menopausal complaints (see [302] for critics of commission F)

nrakta S. Europe. ksacta Damp places by streams and on the littoral[45].

propta Seed - sow March in a warm greenhouse. The seed does not need pre-treatment[113]. Germination is usually free and quick[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in early summer of the following year. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Good percentage[78]. Cuttings of mature wood of the current seasons growth, November in a cold frame[113].

nwatta Landscape Uses:Border, Container, Espalier, Pollard, Standard, Specimen. Prefers a light well-drained loamy soil in a warm sunny position sheltered from cold drying winds[49, 200]. Succeeds in dry soils. Intolerant of water-logging[202]. Hardy to about -10°c, this species only succeeds outdoors in the milder parts of Britain[1, 11]. though it grows well on a wall at Kew[11]. Plants only flower freely in a warm summer, so they are best grown against a sunny wall even in areas of the country where they are hardy[219]. The plants failed to open their flowers on our Cornish trial ground even after a very hot summer[K]. The flowers are produced so late in the season that they are unlikely to produce viable seed in this country even if they flower properly[K]. A very ornamental plant[1], there are some named varieties[219]. The whole plant is aromatic. the leaves and stems are strongly aromatic[182], the flowers are deliciously scented[245] and the dried seeds have a pungent lemony perfume[245]. This species has long been regarded as a symbol of chastity[46]. Flowers are produced at the ends of the current year's growth[202]. Any pruning is best carried out in the spring and should consist of cutting out dead wood and shortening last year's flowering branches[219]. Special Features: Fragrant foliage, Not North American native, Naturalizing, Attracts butterflies, Fragrant flowers, Attractive flowers or blooms. For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]

### 8.2.220 Drepanostachyum falcatum

lennis

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 3.5 m hkuc

hmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Drepanostachyum falcatum is an evergreen Bamboo growing to 3.5 m (11ft 6in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots - cooked[25]. Used as a vegetable[272]. They are also fermented and preserved in Nepal to form a dish called tama[272]. Tama is sour and has a very strong flavour, it is sometimes mixed in vegetable curries[272].

tcanta Basketry Soil stabilization WeavingThe canes are used for making hats, baskets, rods etc[46, 51, 61, 272]. The culms are not very straight, and they have rather swollen nodes, which make them not very suitable as a weaving material[220]. Nevertheless, they are still widely used for this purpose in the Himalayas[220]. They are also used in construction[195]. They are about 2cm in diameter[220]. The plant is used as a very effective soil stabilizer in Nepal[220].

nrakta E. Asia - Himalayas. ksacta Forms dense thickets in evergreen oak forests that are usually damp, to 3600 metres[11, 51].

propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. propta Seed - surface sow as soon as it is ripe in a greenhouse at about 20°c. Do not allow the compost to dry out. There is a degree of dormancy in the seed and it can take 1 - 8 months to germinate at 20 - 25°c, a cold pre-treatment might shorten this time[214]. Grow on in a lightly shaded place in the greenhouse until large enough to plant out. Seed is rarely available. Division in spring as new growth commences. Take divisions with at least three canes in the clump, trying to cause as little root disturbance to the main plant as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Basal cane cuttings.

nwatta Prefers a good loamy soil[214]. Succeeds in most soils so long as they do not dry out[200]. Dislikes drought[1]. Prefers a position sheltered from cold north and east winds[1]. The stems colour more brightly when grown in a sunny position[200], though the leaves curl up in bright sunlight[214]. Succeeds outdoors in a woodland garden in the milder parts of Britain[214]. Plants are intolerant of winter wet and of temperatures below about -6°c[200]. Plants are flowering freely (1993) in Kew and Edinburgh where they are producing abundant fertile seed[214]. This species is notably resistant to honey fungus[200]. There has been much confusion over this species and many plants cultivated under this name have proved to be different species[214]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering, but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122].

### 8.2.189 Arbutus texana

Texas Madrone

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 8 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flat hpa7tmwatli fyifxre7t hjonli

drutta Arbutus texana is an evergreen Tree growing to 8 m (26ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in March, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is polinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitÉdible Uses: Fruit - raw or cooked. A sweetish taste[149], the fruit has a dry mealy flesh[181]. It has narcotic properties[181]. The fruit is up to 1cm in diameter[229].

tcanta Charcoal Fuel WoodWood - heavy, hard, close grained. Used for small tools, mathematical instruments, rollers etc[82, 149]. It is a good fuel and also produces a fine grade of charcoal[149, 229].

dwatta AstringentThe bitter principles in the bark and leaves can be used as an astringent[229].

nrakta South-western N. America - Texas to New Mexico and south to Mexico. ksacta Dry limestone hills[82]. Chaparral and somewhat humid oak forests[181].

propta Seed - best surface sown in a cold frame as soon as it is ripe. Stored seed should be soaked for 5 - 6 days in warm water and then surface sown in a shady position in a greenhouse[78]. Do not allow the compost to become dry. 6 weeks cold stratification helps[134]. The seed usually germinates well in 2 - 3 months at 20°c[134]. Seedlings are prone to damp off[184], they are best transplanted to individual pots as soon as they are large enough to handle and should be kept well ventilated. Grow them on in a greenhouse for their first winter and then plant out in late spring after the last expected frosts[K]. Basal cuttings in late winter[200]. Cuttings of mature wood of the current season's growth, November/December in a frame. Poor percentage[78]. Layering of young wood - can take 2 years[1, 200].

nwatta Requires a lime-free nutrient-rich well-drained moisture-retentive soil in sun or semi-shade and shelter from cold drying winds, especially when young[200]. Succeeds on dry soils[82]. This species is unlikely to be hardy in the

colder areas of the country, it probably tolerates temperatures down to between -5 and -10°c[200]. There is some confusion over the name of this plant, some books suggest that A texana is a synonym of A xalapensis. HBK. whilst others say that A texana exists in its own right and has a synonym of A xalapensis. non HBK[11, 149, 200]. A. texana is very closely related to A. xalapense and is considered by many botanists to be indistinguishable from that species[274].

### 8.2.190 Gynostemma pentaphyllum

Sweet Tea Vine

7 tlin 10 cyuc 2 kcak 0 tcan 5 dwat 8 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Gynostemma pentaphyllum is a AN-NUAL/PERENNIAL growing to 8 m (26ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf from May to October, in flower from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaLeaves and young stems - cooked[105, 177, 183]. The leaves have a sweet taste and are used as a tea[105, 177, 183].

tcanta CosmeticThe plant is used in proprietary preparations for cosmetics and anti-ageing tonics[238].

dwatta Alterative Anticholesterolemic Antispasmodic Hepatic Hypoglycaemic Sedative TonicThe whole plant is a tonic herb that improves the circulation, stimulates liver function, strengthens the immune and nervous systems, and reduces blood sugar and cholesterol levels[238]. It also has sedative effects, relieving spasms and lowering the blood pressure[238]. It is used internally in the treatment of nervous tension and exhaustion, peptic ulcer, asthma, bronchitis, diabetes, cardiovascular disease and cancer[238]. It was rated among the ten most important tonic herbs at a conference on traditional medicines in Beijing in 1991[238].

nrakta E. Asia - China, Japan, Korea. ksacta Thickets in open forests in lowland all over Japan[58, 275]. Forest, thickets or road sides on mountain slopes at elevations of 300 - 3200 metres in China[266].

propta Pre-soak the seed for 24 hours in warm water and then sow it in spring in a rich compost in a greenhouse, placing 2 - 3 seeds per pot. Thin the seedlings to the strongest in each pot and grow the plants on fast. Plant them out after the last expected frosts and protect them with a frame or cloche until they are growing away well.

nwatta Requires a rich well-drained but moisture-retentive soil in a warm sheltered position in partial shade[238]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. A problematic crop outdoors in Britain, it can be grown successfully as an annual in a greenhouse but requires a long hot summer if it is to do well outdoors. Plants tend to be annuals or short-lived perennials[238]. A climbing plant, attaching itself to supports by means of tendrils[238]. Dioecious, male and female plants must be grown if seed is required. Some plants might be monoecious[200].

#### 8.2.191 Prunus campanulata

Taiwan Cherry

7 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Prunus campanulata is a deciduous Tree growing to 7 m (23ft) by 7 m (23ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from April to May, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death.

kcakta Edible Parts: Fruit SeedEdible Uses: Fruit - raw or cooked. A cherry[11], it is edible if the astringency is removed[177]. The fruit is about 11mm in diameter and contains one large seed[200]. Seed - raw or cooked. Do not eat the seed if it is too bitter - see the notes above on toxicity.

tcanta DyeA green dye can be obtained from the leaves[168]. A dark grey to green dye can be obtained from the fruit[168]

dwatta Although no specific mention has been seen for this species, all members of the genus contain amygdalin and prunasin, substances which break down in water to form hydrocyanic acid (cyanide or prussic acid). In small amounts this exceedingly poisonous compound stimulates respiration, improves digestion and gives a sense of well-being[238].

nrakta E. Asia - S. China, S. Japan. ksacta Hill forests below 600 metres[260]. Forests in ravines, forest margins at elevations of 100 - 1300 metres[266].

propta Seed - requires 2 - 3 months cold stratification and is best sown in a cold frame as soon as it is ripe[200]. Sow stored seed in a cold frame as early in the year as possible[200]. Protect the seed from mice etc. The seed can be rather slow, sometimes taking 18 months to germinate[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a greenhouse or cold frame for their first winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood with a heel, July/August in a frame[11, 200]. Softwood cuttings from strongly growing plants in spring to early summer in a frame[200]. Layering in spring.

nwatta Landscape Uses:Specimen. Thrives in a welldrained moisture-retentive loamy soil[11, 200]. Prefers some lime in the soil but is likely to become chlorotic if too much lime is present[1]. Succeeds in sun or partial shade though it fruits better in a sunny position[11, 200]. This species is not very hardy in Britain, though it succeeds outdoors in the milder areas of the country[11]. When fully dormant, it probably tolerates temperatures down to about -10 to -15°c[200]. This species grows well in areas that are too warm for other species of flowering cherries[260]. Most members of this genus are shallow-rooted and will produce suckers if the roots are damaged[238]. A very ornamental plant[1], there are several named varieties[200]. Closely related to P. cerasoides[109]. Plants in this genus are notably susceptible to honey fungus[200]. Special Features: Not North American native. All or parts of this plant are poisonous. Blooms are very showy.

### 8.2.192 Camellia pitardii

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli fyifxre7t hjonli

drutta Camellia pitardii is an evergreen Shrub growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist

kcakta Edible Parts: OilEdible Uses: OilAn oil obtained from the seed is used in cooking[177].

nrakta E. Asia - China. ksacta Forests and thickets, on slopes and by rivers, 1000 - 2800 metres in Yunnan [180, 266].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1-3 months at  $23^{\circ} \text{c}[138]$ . Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10-15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7-10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge pant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species is closely related to C. reticulata[11]. This plant is sometimes cultivated in Asia for the edible oil in its seed.

### 8.2.193 Pittosporum tenuifolium

Tawhiwhi

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 7 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Pittosporum tenuifolium is an evergreen Tree growing to 7 m (23ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

pcista This plant contains saponins[152, 154]. Saponins are found in many foods, such as some beans, and although they are fairly toxic to people they are poorly absorbed by the body and most pass straight through without any problem. They are also broken down if the food is thoroughly cooked for a long time. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: Edible Uses: GumGum - fragrant. It is obtained by bruising the bark or by incision[128, 173].

tcanta Gum Hedge HedgeVery tolerant of trimming, plants can be grown as a formal or informal hedge in exposed maritime areas, though they do not stand extreme exposure[11, 75, 200]. When grown as a formal hedge it is best trimmed in spring, though this will mean that the plant will not produce many flowers[245]. A compromise is to only trim the hedge every other year[245].

nrakta New Zealand. ksacta Coastal to lower montane forests, North and South Islands, especially from North Cape and southwards[44].

propta Seed - sow when ripe in the autumn or in late winter in a warm greenhouse[78, 200]. The seed usually germinates freely. Prick out the seedlings into individual pots when they are large enough to handle, move the plants to a cold frame as soon as they are established and plant out late in the following spring[78]. Consider giving them some protection from the cold during their first winter outdoors. Cuttings of half-ripe wood, 5 - 7cm with a heel, July/August in a frame. Poor to fair percentage[78]. Basal ripewood cuttings late autumn in a cold frame[200].

nwatta Succeeds in most well-drained soils of reasonably good quality in full sun or light shade[1, 200]. Succeeds in dry soils. Fairly tolerant of maritime exposure[75, 182], but it can be killed by cold winds[184]. Hardy to about -10°c[184], it is tender outside the milder areas of Britain, but often self-sows when happy. Plants have reached a height of 9 metres in a sheltered position in eastern England[11]. A very ornamental plant[1], there are many named

they are growing away well. Plant them out in the summer or the following spring.

nwatta Prefers a cool moist well-drained humus-rich soil in partial or dappled shade and protection from scorching winds. Tolerates sandstone and limestone soils but becomes chlorotic if the pH is too high. Prefers a pH between 6 and 6.5[200]. Plants are not very hardy in Britain, though they should succeed outdoors in the milder areas of the country[1]. Plants grow and flower during the winter and early spring in California, dying down in the summer[1]. All members of this genus have more or less edible leaves and flower buds, though those species, such as this one, that have yellow flowers can cause diarrhoea if eaten in large quantities[62, 85, 159].

## 8.2.217 Chimonanthus praecox

Winter Sweet

7 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Chimonanthus praecox is a deciduous Shrub growing to 3 m (9ft) by 3 m (9ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from November to March, and the seeds ripen from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers - thoroughly boiled and then washed[179]. Eaten with oil and salt[177, 183]. The flower petals are used to flavour and scent tea[183].

tcanta Essential WoodThe flowers are very fragrant, they are used in pot-pourri and to make perfumes[1, 46, 61]. The wood, after soaking in water, polishes to a brilliant black finish[178].

dwatta Antiphlogistic Antirheumatic SialagogueThe flowers and flower buds contain 0.5 - 0.6% essential oils comprising benzylalcohol, benzyl acetate, linalcol, terpineol and indole[266]. They are sialagogue[178, 218]. The flowers are used in the treatment of thirst and depression whilst the essential oil is used to treat colds[266]. The leaves and roots can be used in the treatment of contusions, cuts, haemorrhages, strains, lumbago, rheumatism, numbness and colds[266].

nrakta E. Asia - China. ksacta Cliffs in glens and gorges of Ichang province, 30 - 3000 metres[109]. Mountain forests at elevations of 500 - 1,100 metres[266]. Also found in Sichuan, Hubei and Chekiang.

propta Seed - best sown as soon as it is ripe in a cold frame[78, 200]. Pre-soak stored seed in tepid water for two hours, keep warm and moist for 3 days then chill for 5 - 8 weeks and sow in a cold frame[164]. Germination is usually good, though it is often slow and erratic, and takes place in 2 months or more at 13°c[78, 164]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Extremely difficult to root[11]. Layering in spring[200] or in July/August[78]. Takes 9 months[78]. Fair to good percentage[78].

nvatta Landscape Uses: Border, Espalier, Foundation, Massing. Requires a good soil in a sunny sheltered position[164, 200]. Badly drained or compacted soils may cause blotching or yellowing of the leaves[200]. Succeeds in most soils but it seems most at home on chalky ones[219]. A very ornamental plant[1], it is hardy to about -25°c[184]. It is best grown on a sunny wall, however, in order to protect the flowers and induce heavier flowering[11]. The flowers are very fragrant[182], but the plant can be very sparse flowering after cool summers[184]. Plants have a moderate rate of growth[202]. Plants take 5 - 12 years to flower from seed[182, 200]. The var. 'Grandiflorus' comes true from seed and has larger flowers than the type[78]. Plants flower profusely when established and left unpruned[219], if any prung ing is necessary then it is best done immediately after flow-

ering[184, 219]. The flowers are produced on the leaf axils of wood 3 - 4 years old[202]. The flowers emit a powerful sweet fragrance which can be smelt 50 yards away. The smell is like jonquil and violets[245]. When the fragrance is inhaled close to for any length of time the smell seems to disappear[245]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Not North American native, Fragrant flowers, Attractive flowers or blooms.

### 8.2.218 Zanthoxylum clava

Hercules Club. Prickly Ash - Southern, Hercules' club, Southern Prickly Ash

7 tlin 11 cyuc 2 kcak 0 tcan 3 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Zanthoxylum clava-herculis is a deciduous Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf from March to January, in flower from May to June, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Absorption of gut iron reduced. sun sensitivity, bruising and bleeding. May interfere with cardiac glycoside therapy. May interfere with blood clotting drugs [301].

kcakta The following report is for Z. americanum, it is probably also applicable to this species[K]. Seed - used as a condiment. A pepper substitute[106]. The fruit is rather small, about 4 - 5m in diameter[229], but is produced in dense clusters which makes harvesting easy[K]. Each fruit contains a single seed[229].

tcanta Wood - light, soft, weak and close-grained[82, 229]. It weighs 31lb per cubic foot[227]. Too small for commercial use[229].

dwatta Antirheumatic Antispasmodic Diuretic Dysentery Irritant Odontalgic StimulantThis species is guite widely used in herbal medicine, it has the same properties as Z. americanum, but is said to be more active[4]. All parts of the plant, but especially the bark and roots, contain the aromatic bitter oil xanthoxylin[4]. This has a number of applications in medicine[4]. The fruit has a similar medicinal action to the bark[4]. The bark and roots are irritant, odontalgic and antirheumatic[213]. Along with the fruit they are diaphoretic, stimulant and a useful tonic in debilitated conditions of the stomach and digestive organs[4]. They produce arterial excitement and are of use in the treatment of fevers, ague, poor circulation etc[4]. The fruits are considered more active than the bark, they are also antispasmodic, carminative, diuretic and antirheumatic[4, 213, 222]. The pulverized root and bark are used to ease the pain of toothache[213, 222]. One report says that it is very efficacious, but the sensation of the acrid bark is fully as unpleasant as the toothache[213]. Chewing the bark induces copious salivation[222]. Rubbing the fruit against the skin, especially on the lips or in the mouth, produces a temporary loss of sensation[K]. A tea or tincture of the bark has been used in the treatment of rheumatism, dyspepsia, dysentery, heart and kidney troubles etc[222]. A tea made from the inner bark has been used to treat itchy skin[213].

nrakta South-eastern N. America - Virginia to Florida, west to Texas and Arkansas. ksacta Usually found as scattered trees near the coast in light sandy soils, often on bluffs of islands, river banks or dunes[229]. Best growth is from plants in most rich soils with good drainage[229].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Stored seed may requires up to 3 months cold stratification, though scarification may also help[113]. Sow stored seed in a cold frame as early in the year as possible. Germination should take place in late spring, though it might take another 12 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a cold frame for their first winter. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, 3cm long, planted horizontally in

their first few winters outdoors. Cuttings of half-ripe wood, July/August in a frame. Layering in October.

nwatta Prefers a moderately heavy loam with a generous amount of compost and sand added and a very sunny position[1, 200]. When growing plants in pots, a compost comprising equal quantities of loam and leafmould plus a little charcoal should produce good results[260]. Do not use manure since Citrus species dislike it[260]. When watering pot plants it is important to neither overwater or underwater since the plant will soon complain by turning yellow and dying. Water only when the compost is almost dry, but do not allow it to become completely dry[260]. Reasonably cold resistant, dormant plants can tolerate temperatures down to about -10°c, especially if they are grafted onto a Poncirus trifoliata rootstock[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. A group of hybrids of garden origin. Poncirus trifoliata x Citrus paradisi[183]. Generally, these hybrids combine the qualities of cold hardiness and bitterness from Poncirus trifoliata with the larger fruits of the grapefruit. Citrus paradisi[183]. They are occasionally cultivated for their edible fruit, but more usually for their use as a rootstock, there are some named varieties[183, 200].

### 8.2.214 Gaultheria macrostigma

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat m hkuc hmim cyutli tcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Gaultheria macrostigma is an evergreen Shrub growing to 0.5 m (1ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semishade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[173]. Fairly large[182]. The fruit is about 6mm in diameter[200].

tcanta A good ground cover for sun or light shade.

nrakta New Zealand. ksacta Montane to lower subalpine open grassland and rocky places in North South and Stewart Islands from 39° and southwards[44].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and surface sow in a lime-free compost in a shady part of the greenhouse and keep moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°c, but the seedlings are liable to damp off. Watering them with care and making sure you give them plenty of ventilation will reduce this risk. Watering them with a garlic infusion can also help to prevent this[K]. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring just before new growth begins. 'Drop' the plants 12 months earlier by digging them up and replanting them deeper in the soil so that the branches are buried and can form roots. This works best in a sandy soil[78]. It is best to pot up the divisions and grow them on in light shade in a greenhouse until they are established. Plant them out in the summer. Layering in September/October. Takes 12 months[78].

nwatta Requires a light well-drained lime-free soil[1]. The plant can make a good nesting place for mice, these mice he eat the bark of the stems in winter causing die-back. Dioecious. Male and female plants must usually be grown if seed is required. This species, however, does not need a male pollinator in order to fruit well. It also hybridizes freely in the wild with other members of this genus[11]. Plants in this genus are notably resistant to honey fungus[2001.

### 8.2.215 Iuniperus tetragona

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus tetragona is an evergreen Tree. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. A sweet resinous flesh[181]. The fruits are about 12mm in diameter[2].

tcanta WoodWood - brown, hard. Used for construction etc[61]

nrakta South-western N. America - Texas to Mexico. ksacta Pine-oak forests in mountains, to 4500 metres in Mexico[181]

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1] and succeeding on chalk[200]. A drought tolerant plant once established, succeeding in hot dry positions[200]. This species is not very hardy in Britain[1]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.216 Viola pedunculata

Grass Pansy, Johnny-jump-up 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Viola pedunculata is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: TeaYoung leaves and flower buds - raw or cooked[105, 161, 177]. When added to soup they thicken it in much the same way as okra[85, 159]. The leaves are best harvested before the flowers open in the spring[257]. Some caution is advised, the yellow flowers of this species can cause diarrhoea if eaten in large quantities[62]. A tea can be made from the leaves[85].

nrakta South-western N. America - California. ksacta Grassy slopes below 450 metres[71].

propta Seed - best sown in the autumn in a cold frame. Sow stored seed in early spring in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in the summer. Division in the autumn or just after flowering. Larger divisions can be planted out direct into their permanent positions, though we have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until

varieties[200]. Very amenable to pruning, plants can be cut right back into old wood if required[200]. The species in this genus are very likely to hybridize with other members of the genus[200]. When growing a species from seed it is important to ensure that the seed either comes from a known wild source, or from isolated specimens in cultivation. Plants are widely cultivated for their foliage which lasts a long time in water and is used in flower arranging[11, 75]. The flowers are honey-scented[188]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.194 Juglans californica

California Walnut, Southern California walnut 7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 6 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Juglans californica is a deciduous Tree growing to 6 m (19ft 8in) at a medium rate. See above for USDA hardness. It is hardy to UK zone 8. It is in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Oil SeedEdible Uses: OilSeed - raw, cooked or used in pies, cakes, biscuits, confections etc[183]. A sweet flavour[229]. The seed is small with a thick shell but it makes good eating and is said to have a better flavour than Juglans nigra[183]. The seed is up to 15mm in diametr[229]. The seed ripens in late autumn and, when stored in its shell in a cool place, will keep for at least 6 months[K]. An edible oil is obtained from the seed, it tends to go rancid quickly.

tcanta Herbicide Oil Rootstock WoodThis species is sometimes used as a rootstock for the common walnut, Juglans regia[183]. Plants produce chemicals which can inhibit the growth of other plants. These chemicals are dissolved out of the leaves when it rains and are washed down to the ground below, reducing the growth of plants under the tree[18, 20, 159]. The roots of many members of this genus produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. Wood - moderately coarse-grained. An attractive wood, but the frequent branching pattern of the trunk limits the use of this wood commercially[229]

dwatta Blood tonicAn infusion of the leaves is used to treat thin blood[257].

nrakta South-western N. America - California. ksacta Moist or dry gravelly soils along river courses and bottomlands[229]. Locally common in oak woods below 750 metres[71].

propta The seed is best sown as soon as it is ripe in individual deep pots in a cold frame[80]. You need to protect it from mice, birds, squirrels etc. The seed usually germinates in late winter or the spring. Plant out the seedlings into their permanent positions in early summer and give some protection from the cold for their first winter or two. The seed can also be stored in cool moist conditions (such s the salad compartment of a fridge) over the winter and sown in early spring but it may then require a period of cold stratification before it will germinate[78, 80].

nwatta Requires a deep well-drained loam and a sunny position sheltered from strong winds[1, 11]. Prefers a slightly alkaline soil[200]. Plants are not very hardy in Britain, tolerating temperatures down to between -5 and -10°c[200]. A fairly fast-growing tree in its native habitat, but guite short-lived, dying after about 125 - 150 years[229]. Plants produce a deep taproot and they are intolerant of root disturbance[1, 11]. Seedlings should be planted out into their permanent positions as soon as possible and given some protection since they are somewhat tender when young[1. 11]. Flower initiation depends upon suitable conditions in the previous summer[200]. The flowers and young growths can be destroyed by even short periods down to -2°c, but fortunately plants are usually late coming into leaf[200]. Any pruning should only be carried out in late summer to early autumn or when the plant is fully dormant otherwise

wounds will bleed profusely and this will severely weaken the tree[200]. Trees have a dense canopy which tends to reduce plant growth below them. We have no specific information for this species, but the roots of several members of this genus produce substances that are toxic to many plant species, especially apples (Malus species), members of the Ericaceae, Potentilla spp and the white pines (certain Pinus spp.)[200]. The leaves of many species also secrete substances that have an inhibitory affect on plants growing underneath them. All in all this is not a very good companion plant[K]. Closely related to J. hindsii[183, 200]

### 8.2.195 Rhus chinensis

Chinese Gall, Chinese sumac

7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 6 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Rhus chinensis is a deciduous Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower in August, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista There are some suggestions that the sap of this species can cause a skin rash in susceptible people, but this has not been substantiated. See also notes in 'Cultivation Details'

kcakta Edible Parts: Fruit OilEdible Uses: Curdling agent Oil SaltFruit - cooked[2, 146, 158, 183]. An acid flavour[2]. It is also used medicinally[2, 158]. The fruit can be used as a salt or a rennet substitute[105, 183].

tcanta Dye Ink Mordant Oil Tannin WaxThe leaves are rich in tannin. They can be collected as they fall in the autumn and used as a brown dye or as a mordant[169]. A blue dye is obtained from insect galls on the plant[61], it can also be used as an ink[171]. The galls are formed as a result of damage by the greenfly, Aphis chinensis[223]. The galls contain up to 77% tannin[223]. The reports do not say if the galls are harvested before or after the insect has left the gall. An oil is extracted from the seeds[4, 146]. It attains a tallow-like consistency on standing and is used to make candles. These burn brilliantly, though they emit a pungent smoke[4]. The wood is soft and is not used[158].

dwatta Anthelmintic Antiphlogistic Antiseptic Astringent Cholagogue Depurative Dysentery Haemostatic MalariaThe leaves and the roots are depurative[147]. They stimulate blood circulation[147]. A decoction is used in the treatment of haemoptysis, inflammations, larvngitis, snakebite, stomach-ache and traumatic fractures[147, 218]. The stem bark is astringent and anthelmintic[218]. The fruit is used in the treatment of colic[240]. The seed is used in the treatment of coughs, dysentery, fever, jaundice, malaria and rheumatism[218]. The root bark is cholagogue[218]. Galls on the plant are rich in tannin[279]. They are used internally for their astringent and styptic properties to treat conditions such as diarrhoea and haemorrhage[218, 279]. They are a frequent ingredient in polyherbal prescriptions for diabetes mellitus[218]. An excrescence produced on the leaf by an insect Melaphis chinensis or M. paitan (this report probably refers to the galls produced by the plant in response to the insect[K]) is antiseptic, astringent and haemostatic[176]. It s used in the treatment of persistent cough with blood, chronic diarrhoea, spontaneous sweating, night sweats, bloody stool, urorrhoea and bloody sputum. It is used applied externally to burns, bleeding due to traumatic injuries, haemorrhoids and ulcers in the mouth[176]. Some caution is advised in the use of the leaves and stems of this plant, see the notes above on toxicity.

nrakta E. Asia - China, Japan. ksacta Lowland, hills and mountains in Japan[58]. Also found in the Himalayas (as R. semialata) where it grows in secondary forests to 2100 metres[146].

propta Seed - best sown in a cold frame as soon as it is ripe. Pre-soak the seed for 24 hours in hot water (starting at a temperature of 80 - 90c and allowing it to cool) prior to

sowing in order to leach out any germination inhibitors[200]. This soak water can be drunk and has a delicious lemonflavour. The stored seed also needs hot water treatment and can be sown in early spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into in dividual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 10cm with a heel, July/August in a frame[200]. Root cuttings 4cm long taken in December and potted up vertically in a greenhouse. Good percentage[78, 200]. Suckers in late autumn to winter[200].

nwatta Succeeds in a well-drained fertile soil in full sun[11, 200]. A very ornamental plant[11], it is not fully hardy in all parts of Britain and needs a hot summer in order to fully ripen its wood, suffering winter damage to late growth if the temperature falls below about -7°c[200]. The young growth in spring can be damaged by late frosts. The plants are also susceptible to coral spot fungus and any winter damage will exacerbate the situation[11]. Plants have brittle branches and these can be broken off in strong winds[200]. Many of the species in this genus are highly toxic and can also cause severe irritation to the skin of some people, whilst other species such as this one are not poisonous. It is relatively simple to distinguish which is which, the poisonous species have axillary panicles and smooth fruits whilst non-poisonous species have compound terminal panicles and fruits covered with acid crimson hairs[1, 4]. The toxic species are sometimes separated into their own genus. Toxicodendron, by some botanists[200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.196 Camellia chekiangoleosa

Camellia

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia chekiangoleosa is an evergreen Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn oil is obtained from the seed[177].

nrakta E. Asia - China. ksacta High mountains, 500 - 1300 metres[180]. Forests and thickets at elevations of 600 - 1300 metres in N Fujian, E Hunan, E and W Jiangxi and S Zheijang Provinces[266].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel. August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200]. This species is a valuable oil crop and is cultivated for its oil in Chekiang, China[266]. It is closely related to C. japonica[200].

### 8.2.197 Coprosma lucida

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma lucida is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit raw. Sweet and juicy[173], but with little flavour[225]. Dry weight is 3.3% protein, 8.1% sugar and 24.6% lipids[173]. The orange fruit is about 12mm in diameter[200, 225]. The roasted seed is an excellent coffee substitute[173].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Forest and shrubby areas, especially marginal, to the montane zone. Found throughout New Zealand[44, 173].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Plants have proved to be nearly hardy in an Essex garden[225]. Hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Sometimes found as an epiphyte in the wild[44]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

#### 8.2.198 Vaccinium ashei

Rabbiteye Blueberry

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 5 m hkuc

hmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli dyatxre7t hjonli

drutta Vaccinium ashei is a deciduous Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[3, 105, 142]. It is often insipid but some forms are well-flavoured[1, 200]. The fruit is often used for preserves etc and can also be dried for later use[183]. The fruit is up to 16mm in diameter[200].

nrakta South-eastern N. America. ksacta Swamps and barren pine land[3,72].

propta Seed - sow late winter in a greenhouse in a limefree potting mix and only just cover the seed[78]. Stored seed might require a period of up to 3 months cold stratification[113]. Another report says that it is best to sow the seed in a greenhouse as soon as it is ripe[200]. Once they are about 5cm tall, prick the seedlings out into individual pots and grow them on in a lightly shaded position in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Requires a well-drained soil in a sunny position[200]. This species is only hardy in the milder areas of Britain, tolerating temperatures down to about -5 to -10°c[11, 200]. There is some doubt as to whether this species is distinct from D. delavayi[11]. This genus is closely related to the quince, Cydonia oblonga[200].

### 8.2.210 Leptospermum liversidgei

Lemon-Scented Tea Tree

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 4 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Leptospermum liversidgei is an evergreen Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Edible Uses: TeaThe dried leaves are a tea substitute[183]. Lemon-scented[144, 177].

tcanta EssentialAn essential oil obtained from the leaves[11] is used as a bactericide[156].

dwatta Antibacterial Antibacterial [156].

nrakta Australia. ksacta Swamps by the coast in New South Wales[156, 265].

propta Seed - sow spring in a greenhouse and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold for their first winter or two outdoors. The seed remains viable for many years. Cuttings of half-ripe wood, 5 - 8 cm with a heel, early August in a frame. Over-winter in the greenhouse for its first year. Good percentage[78]. Cuttings of almost mature wood, 4 - 5 cm with a heel, October/November in a frame. Good percentage[78].

watta Succeed in almost any neutral or acid soil of good or reasonable quality, preferring a light sandy loam and full sun[200]. Prefers a position sheltered from hot or cold drying winds[200]. Only succeeds outdoors in the mild areas of Britain, tolerating temperatures down to about -10°c[200]. If plants are killed back in cold winters they sometimes sprout afresh from the old wood[219]. This species does not regenerate from old wood[200]. Resents root disturbance[200]. The leaves have a delightful lemon scent[182, 219]. The forms grown in Britain have a very weak scent, is this due to a lack of sun?[11]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.211 Camellia vunnanensis

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 3.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hionli

drutta Camellia yunnanensis is an evergreen Shrub growing to 3.6 m (11ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn oil is obtained from the seed[180].

nrakta E. Asia - South-western China. ksacta Mixed forest and open scrub, open thickets, pine forests and lauraceous woods, 2000 - 2600 metres in Yunnan[180].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel, August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame.

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are hardy to about -10°c and succeed outdoors in the milder areas of Britain[260]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200].

### 8.2.212 Dudleva pulverulenta

Chalk Lettuce, Chalk dudleya

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Dudleya pulverulenta is a PERENNIAL. See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Leaves - raw[46, 61, 161].

nrakta South-western N. America - California to Arizona. ksacta Found in coastal sage scrub and chaparral plant communites from sea level to elevations of 1500 metres[276].

propta Seed -

nwatta 257204 This species is not very hardy in Britain and requires protection from frosts[200]. This contradicts slightly with the plants hardiness rating in the same book of 8, which suggests it should tolerate temperatures down to about -5°c[200, K].

### 8.2.213 Citroncirus

Citrumelo, Citroncirus, Citrange

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Citroncirus is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. Very acid but it can be used in the ways that lemons are used.

nrakta A hybrid of garden origin, Poncirus trifoliata  $\boldsymbol{x}$  Citrus paradisi. ksacta Not known in the wild.

propta The following notes are based on Citrus species. They are probably applicable here as well, even though this is a bi-generic hybrid, since any seed might be produced polyembrionically. The seed is best sown in a greenhouse as soon as it ripe after thoroughly rinsing it[164, 200]. Sow stored seed in March in a greenhouse[3]. Germination usually takes place within 2 - 3 weeks at 13°c. Seedlings are liable to damp off so they must be watered with care and kept well ventilated. The seed is usually polyembrionic, two or more seedlings arise from each seed and they are genetically identical to the parent but they do not usually carry any virus that might be present in the parent plant[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least three growing seasons before trying them outdoors. Plant them out in the summer and give them some protection from the cold for

of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. The tree flowers on new growth produced in spring, the seed ripening in its first year[200, 229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.207 Rhamnus croceus

7 tlin 10 cvuc 2 kcak 0 tcan 0 dwat 4 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Rhamnus croceus is an evergreen Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in April, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist

pcista Although no specific mention of toxicity has been found for this species, there is the suggestion that some members of this genus could be mildly poisonous[65].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[46. 61, 105, 257]. If eaten in large quantities they can temporarily tinge the skin red[2, 183]. The fruit is about 5 - 6mm in diameter[200] and has a thin dry flesh[82]. Some caution is advised, see the notes above on toxicity.

nrakta South-western N. America - California to Arizona, south to Mexico, ksacta Scrub and open forests below 1500 metres[184]. Dry washes and canyons[71].

propta Seed - best sown in the autumn in a cold frame. Stored seed will require 1 - 2 months cold stratification at about 5° and should be sown as early in the year as possible in a cold frame or outdoor seedbed[200]. Germination is usually good, at least 80% by late spring. Prick out the seedlings into individual pots when they are large enough to handle, and grow them on in the greenhouse or cold frame for their first winter. Plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame[113]. Cuttings of mature wood of the current year's growth, autumn in a frame. Layering in early spring[4].

nwatta Succeeds in any reasonably good soil[11]. Requires a well-drained sunny site[200]. Plants are possibly hardy to -15°c according to one report[184], whilst another says that this species is rather tender in Britain[1]. The subspecies R. croceus ilicifolia. Greene. often forms a tree up to 7 metres tall[82]. The species in this genus are notably resistant to honey fungus[200]. The flowers are produced in small clusters in the leaf axils or from small persistent bracts on shoots of the year[82]. Plants of this species can be hermaphrodite or dioecious[82]. If fruit and seed is required it is necessary to grow a hermaphrodite form, or male and female forms.

#### 8.2.208 Larrea tridentata

Creosote Bush - Chaparral 7 tlin 10 cyuc 2 kcak 3 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Larrea tridentata is an evergreen Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

pcista Acute hepatitis associated with oral use. Contact dermatitis also reported. Not considered safe as a herbal

kcakta Edible Parts: Edible Uses: Condiment TeaThe flower buds are pickled in vinegar and used as a caper substitute[183]. The stems and leaves are a tea substitute[183]. The twigs are chewed to alleviate thirst[2, 183]. A resin is obtained from the leaves and twigs, it delays or prevents oils and fats from becoming rancid[183].

tcanta Carbon Farming - Industrial Crop: hydrocarbon. dwatta Expectorant Odontalgic UrinaryCreosote bush was widely used by various North American Indian tribes. A decoction of the leaves was used to treat diarrhoea and stomach troubles whilst the young twigs were used to treat toothache and a poultice of the leaves was used to treat chest complaints and as a wash for skin problems[254]. It continued to be widely used as a treatment for rheumatic disease, venereal infections, urinary infections and certain types of cancer especially leukaemia until its sale was hanned in North America due to concern over its potential toxic effect upon the liver[254]. There have been a number of cases of acute or sub-acute hepatitis attributed to the use of this herb and so its internal use is not recommended until further research has been carried out[254]. A tea made from the leaves is used as an expectorant and pulmonary antiseptic[213]. Some N. American Indian tribes heated the shoot tips of this plant and dripped the sap (probably the resin[K]) into tooth cavities to treat toothache[213].

nrakta South-western N. America. ksacta Desert ar-

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of new growth in spring in a frame[200].

nwatta Experimental Crop Industrial Crop: Hydrocarbon Management: CoppiceRequires a moderately fertile moisture-retentive soil in full sun or light shade[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The plant is resinous and aromatic[200]. Carbon Farming - Cultivation: experimental. Management: coppice.

#### 8.2.209 Docynia indica

7 tlin 10 cvuc 2 kcak 0 tcan 0 dwat 4 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Docynia indica is an evergreen Tree growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[1, 146, 272]. The fully ripe fruit is edible[272]. It is eaten when half ripe[177]. The fruit is about 5cm in diameter[200].

tcanta WoodWood - hard, close and even grained[146]. nrakta E. Asia - China to the Himalayas. ksacta Open places to elevations of 2000 metres in Nepal, Sikkim and Bhutan[146, 272]. Slopes, streamsides and thickets at elevations of 2000-3000 metres in western China[266].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant

last expected frosts. Cuttings of soft wood, May/June in par- in a frame. Over-winter in the greenhouse for its first year. tial shade in media containing pine bark[113]. Cuttings of half-ripe wood, 5 - 8cm with a heel, August in a frame[78]. Slow and difficult. Layering in late summer or early autumn[78]. Another report says that spring is the best time to layer[200]. Takes 18 months[78]. Division of suckers in spring or early autumn[113].

nwatta Requires a moist but freely-draining lime free soil, preferring one that is rich in peat or a light loamy soil with added leaf-mould[11, 200]. Prefers a very acid soil with a pH in the range of 4.5 to 6, plants soon become chlorotic when lime is present. Succeeds in full sun or light shade though it fruits better in a sunny position[200]. Requires shelter from strong winds[200]. Plants are not hardy in all parts of Britain, they should succeed outdoors in the milder areas, tolerating temperatures down to between -5 and -10°c[200]. Often cultivated for its edible fruit, there are many named varieties[142]. Plants have a low chillfactor and so succeed in areas nearer the equator such as Florida[183]. There is some confusion over this name with some authorities seeing it as no more than a synonym for V. virgatum. For the time being it will be kept here as a distinct species. Dislikes root disturbance, plants are best grown in pots until being planted out in their permanent positions[200]. Established plants are drought resistant[183]. Plants in this genus are notably resistant to honey fungus[200]. The plant is heat tolerant in zones 9 through 2. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the aboveground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is multistemmed with multiple stems from the crown [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

#### 8.2.199 Leptospermum lanigerum

woolly tea-tree

7 tlin 10 cyuc 2 kcak 2 tcan 0 dwat 5 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Leptospermum lanigerum is an evergreen Shrub growing to 5 m (16ft 5in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea substitute[183].

tcanta Hedge Hedge WoodThis species can be grown as a hedge in positions that are not too exposed. When trimming, however, the plants should not be cut back into old wood because they will not grow back. Other Uses The wood is tough, hard, heavy and close grained. Durable when used internally[601]. It is used for poles, stakes, tool handles etc[154, 601]. The wood makes a good fuel[154].

nrakta Australia - New South Wales, Queensland, South Australia, Tasmania, Victoria. ksacta Mountainous areas and down to the coast[184]. Wet heathland, open eucalyptus forest and by streams[260].

propta Seed - sow spring in a greenhouse and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. and give some protection from the cold for their first winter or two outdoors. The seed remains viable for many years. Cuttings of half-ripe wood, 5 - 8 cm with a heel, early August Good percentage[78]. Cuttings of almost mature wood, 4 -5 cm with a heel, October/November in a frame. Good percentage[78].

nwatta Succeed in almost any neutral or acid soil of good or reasonable quality, preferring a light sandy loam and full sun[200]. Grows best in an acid sandy soil[260]. Prefers a position sheltered from hot or cold drying winds[200]. Another report says that it tolerates fairly exposed positions and that has been our experience with it[K]. Hardy to at least -7°c in Australian gardens, where it succeeds in sun or shade, it only succeeds outdoors in mild areas of Britain, requiring the protection of a wall in colder parts. Plants are hardy to about -15°c in Britain[184]. Polymorphic[157]. There are two distinct forms grown in Britain, one with smallish grevish leaves is sometimes known as L. cunninghamii, the second form has larger narrow glossy green leaves[219]. Plants seldom grow taller than about 2 metres in Britain. Resents root disturbance[200]. Does not regenerate from old wood[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.200 Ehretia anacua

Anagua, Knockaway

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 5 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Ehretia anacua is an evergreen Tree growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from October to March, and the seeds ripen from October to March. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 149, 161, 183]. Sweet and rather juicy but it has a thin flesh[82]. The fruit is about 8mm in diameter[200].

tcanta WoodWood - heavy, hard, not strong, close grained, difficult to split. Used for tool handles, yokes, axles, wheel spokes etc[46, 61, 82, 149].

nrakta South-western N. America - S.E. Texas to Mexico. ksacta Develops into a tree when growing in river vallevs in fertile soils, it is also found as a shrub on dry barren ridges[82].

propta Seed - we have no information on this species but suggest sowing it as soon as it is ripe in a greenhouse. Sow stored seed in late winter or early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Division of suckers in the growing season.

nwatta Prefers a moderately fertile well-drained sandy loam in a sunny position[200]. Tolerates exposed positions[200]. Plants are shade tolerant in continental climates but they require more sun in maritime areas in order to ripen the wood[200]. Rich fertile soils encourage soft sappy growth which is then more susceptible to winter damage[200]. This species is not very hardy in Britain, but dormant plants have survived temperatures down to -13°c when growing in a suitable position. The young growth in spring. even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Spreads by means of suckers[149].

### 8.2.201 Debregeasia hypoleuca

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 5 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nvanhien hionli

drutta Debregeasia hypoleuca is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and

female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[272]. Sweet but insipid and mucilaginous[158]. About the size of a pea[51, 146]. Used as a flavouring[177].

tcanta Fibre WoodA fibre is obtained from the bark[272]. It is used for making twine and rope[46, 51, 61, 123, 140, 158]. Wood - soft and light. It is not much use[158] and is mployed mainly as a fuel[272].

nrakta W. Asia to the W. Himalayas. ksacta Forests and shrubberies[51], chiefly along watercourses, 1500 - 2400 metres[146, 158].

propta Seed - sow late winter to mid-summer in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 2 months at  $20^{\circ}$ c(175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings in early summer[1].

nwatta Prefers a fertile well-drained loam with some shelter at the hottest part of the day[200]. Plants tolerate occasional lows to about  $15^{\circ}\text{c}[260]$ . This species is probably not very hardy in Britain and will probably require greenhouse protection, though it might be possible to grow it outdoors in the mildest areas of the country, especially if it is given the protection of a warm wall. Dioecious, male and female plants must be grown if seed and fruit is required.

### 8.2.202 Citrus ichangensis

Ichang Papeda

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 4.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Citrus ichangensis is an evergreen Shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. Juicy but too acid for most people to eat raw, the fruit can be used as a lemon substitute[200]. The fruit is quite large, up to 10cm x 5cm but with large seeds about 15mm long and 8mm thick[200].

dwatta Miscellany Vitamin CCitrus species contain a wide range of active ingredients and research is still underway in finding uses for them. They are rich in vitamin C, flavonoids, acids and volatile oils. They also contain coumarins such as bergapten which sensitizes the skin to sunlight. Bergapten is sometimes added to tanning preparations since it promotes pigmentation in the skin, though it can cause dermatitis or allergic responses in some people[238]. Some of the plants more recent applications are as sources of anti-oxidants and chemical exfoliants in specialized cosmetics[238].

nrakta E. Asia - W. and S.W. China. ksacta Highland ar-

propta The seed is best sown in a greenhouse as soon as it ripe after thoroughly rinsing it[164, 200]. Sow stored seed in March in a greenhouse[3]. Germination usually takes place within 2 - 3 weeks at 13°c. Seedlings are liable to damp off so they must be watered with care and kept well ventilated. The seed is usually polyembrionic, two or more seedlings arise from each seed and they are genetically identical to the parent but they do not usually carry any virus that might be present in the parent plant[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least three growing seasons before trying them outdoors. Plant them out in the summer and give them some protection from the cold for their first few winters outdoors. Cuttings of half-ripe wood, July/August in a frame. Layering in October.

nwatta Prefers a moderately heavy loam with a generous amount of compost and sand added and a very sunny posi-

tion[200]. Prefers a pH of 5 to 6[200]. Plants are intolerant of water logging[200]. When growing plants in pots, a compost comprising equal quantities of loam and leafmould plus a little charcoal should produce good results[260]. Do not use manure since Citrus species dislike it[260]. When watering pot plants it is important to neither overwater or underwater since the plant will soon complain by turning yellow and dying. Water only when the compost is almost dry, but do not allow it to become completely dry[260]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -5°c when dormant[200]. The young growth in spring, even on mature plants, is frost-tender and so it is best to grow the plants in a position sheltered from the early morning sun[K]. Occasionally cultivated for its edible fruit, there are some named varieties[183]. This is the hardiest member of the Citrus genus and is of interest for use in breeding for greater cold tolerance in other members of this genus[200]. Plants dislike root disturbance and so should be placed into their permanent positions when young. If growing them in pots, great care must be exercised when potting them on into larger containers[238]. The flowers are sweetly scented[245].

### 8.2.203 Berchemia lineata

7tlin 10 cyuc 2 kcak 0 tcan 1 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Berchemia lineata is a deciduous Climber growing to 4 m (13ft lin). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen in November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers meils soil

kcakta Edible Parts: FruitEdible Uses: Fruit. - raw or cooked[177, 272]. Only eat the fruit when it is black ripe[105]. The fruit is not very freely produced in Britain[1]. The fruit is about 8mm in diameter[2001.

dwatta Antitussive FebrifugeThe plant has been used as a febrifuge[240]. The roots and leaves have been used as a medicine to relieve coughs and reduce sputum, to treat injuries, trauma and snakebite[266]

nrakta E. Asia - C. and N. China to the Himalayas. ksacta On rocks and in forests, 2000 - 2700 metres in the Himalayas[146]. Scrub thickets in dry places at elevations of 2400 - 4000 metres in Nepal[272].

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Cuttings of mature wood of the current season's growth, November to January in a frame. Root cuttings in winter[200]. Layering of young stems in winter[200].

nwatta Requires a good moist well-drained loam, succeeding in full sun if the soil does not dry out otherwise it is best in light shade[11, 200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Suitable for growing along fences, against walls with wire supports or for growing through other shrubs[200]. Plants climb by means of twining around supports[182]. Closely related to B. edge-worth[1921]

### 8.2.204 Arctostaphylos glauca

Bigberry Manzanita

7 tiin 10 cyuc 2 kcak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli fyifxre7t hionli

drutta Arctostaphylos glauca is an evergreen Shrub growing to 4 m (13ft lin). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy) and medium (loamy)

soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil

kcakta Edible Parts: FruitEdible Uses: DrinkFruit - raw or cooked[3]. The fruit is used fresh or it can be dried and ground into a powder then used to make mush or added to soups etc[105, 161, 183, 257]. It can also be used to make preserves or a beverage that resembles cider in flavour[183]. A drink is made from the berries by sprinkling them with water, kneading them with the hands, mashing them and then soaking them in the sun for about 12 hours. The liquid is then sieved to remove the pulp before being drunk on its own or with Chia (see Salvia columbiana). Water could be drained through the pulp a second time. The liquid was said to be sweet and fattening[257]. The fruit is dry and with little flavour[2]. The seeds can be dried, ground into a powder and used to make a mush or cakes[257]. The seed is rather small, it would most probably have been used together with the fruit and not have been separated from it[K].

tcanta Broom Dye Fuel WoodA yellowish-brown dye is obtained from the leaves, it does not require a mordant[168]. The branches have been used to make a broom[257]. The wood makes a good fuel, producing a lot of heat and burning for a long time[257]. The wood is hard and tough. It is used for making small tools, awl handles etc[257].

dwatta Antiseptic Astringent Diuretic Skin UrinaryThe dried leaves are used in the treatment of a variety of complaints[4]. These leaves should be harvested in early autumn, only green leaves being selected, and then dried in gentle heat[4]. A tea made from the dried leaves is strongly astringent, diuretic and an antiseptic for the urinary tract[4, 222]. It is much used for kidney and bladder complaints and inflammation of the urinary tract, but it should be used with caution[4, 21, 46, 172] because it contains arbutin which hydrolyzes into the toxic urinary antiseptic hydroquinone[222]. Externally, an infusion is used to treat poison oak rash[257].

nrakta South-western N. America - S. California. ksacta Dry slopes below 1500 metres[71].

propta Seed - best sown in a greenhouse as soon as it is ripe. Pre-soak dried seed in boiling water for 10 - 20 seconds or burn some straw on top of them and then stratify at 2 - 5°c for 2 months[11, 200]. The seed usually germinates in 2 - 3 months at 15°c[134]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse or cold frame for at least their first winter, Plant out in late spring or early summer. Cuttings of side shoots of the current season's growth, 5 - 8cm with a heel, August to December in a frame. Takes one year[1, 78]. Division in early spring. Take care because the plant resents root disturbance. Pot the divisions up and keep them in a lightly shaded position in a cold frame or greenhouse until they are growing away actively. Layering in spring[200].

nwatta Requires a deep moist well-drained light or medium lime-free loam in sun or semi-shade[3, 11, 200] but plants produces less fruit when they are grown in the shade[200]. Prefers a warm sunny position[3, 166]. Found on dry soils in the wild, one report says that it succeeds in a hot dry position. Hardy to between -5 and -10°c, succeeding outdoors in the milder parts of Britain[200]. Plants resent root disturbance and should be placed in their final positions as soon as possible[134].

### 8.2.205 Camellia polyodonta

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 4.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Camellia polyodonta is an evergreen Shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to June, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn oil obtained from the seed is used in cooking[180].

nrakta E. Asia - China. ksacta Forests at elevations of 500 - 1000 metres in W Guangdong, E and NE Guangxi and S Hunan Provinces[266].

propta Seed - can be sown as soon as it is ripe in a greenhouse[113]. Stored seed should be pre-soaked for 24 hours in warm water and the hard covering around the micropyle should be filed down to leave a thin covering[78, 113, 138]. It usually germinates in 1 - 3 months at 23°c[138]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in the greenhouse for at least their first winter. Plant them out into their permanent positions when they are more than 15cm tall and give them some protection from winter cold for their first year or three outdoors[K]. Cuttings of almost ripe wood, 10 - 15cm with a heel. August/September in a shaded frame. High percentage but slow[78]. Cuttings of firm wood, 7 - 10cm with a heel, end of June in a frame[11, 78]. Keep in a cool greenhouse for the first year[11]. Leaf-bud cuttings, July/August in a frame

nwatta Prefers a woodland soil but thrives in a warm open well-drained loam if leafmould is added[1, 11, 200]. A calcifuge plant, preferring a pH between 5 and 7[11, 200]. Prefers the partial shade of a light woodland[200]. Prefers a wet summer and a cool but not very frosty dry winter[200]. Plants are not very self-compatible, self-fertilized flowers produce few seeds and these are of low viability[200].

### 8.2.206 Quercus durata

California Scrub Oak, Leather oak

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 4 m hkuc

hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus durata is an evergreen Shrub growing to 4 m (13ft lin). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked[161]. It can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed, which is up to 35mm long and 15mm wide[82], contains bitter tannins. These can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent TanninA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4].

dwatta Astringent DysenteryAny galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta South-western N. America - California. ksacta Coastal ranges[11]. The type species is found on serpentine soils at 150-1500 m, whilst var gabrielensis is found in chaparral on dry, exposed, loose slopes in nonserpentine soils at 450 - 1000 m[270]

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities

This species is so prolific that large clumps can be dug up in late summer for re-establishment[233].

nwatta Landscape Uses:Border, Container, Foundation, Massing. Requires a fertile, moisture retentive well-drained soil and a warm situation in sun or semi-shade[200]. Another report says that it is easily grown in any soil in sun or part shade[190]. Established plants are drought tolerant[190]. Plants succeed in maritime gardens[233]. Plants have proved very tolerant of neglect on our trial grounds in Cornwall, one clump grew and thrived in rank grass for a number of years until increasing shade from trees began to reduce its vigour[K]. This is the hardiest member of the genus, tolerating temperatures down to between -10 and -15°c, especially if the roots are mulched in the winter[187]. Young plants are best given a protective mulch for their first winter or two[233]. Somewhat intolerant of root disturbance[1], the roots are fleshy and brittle[200]. The plant can be rather invasive, spreading by means of thin fleshy roots[187]. Special Features: Attractive foliage, Suitable for cut flowers

### 8.2.371 Daphne oleoides

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 1 m hkuc htut cyutli kyuctcup hwicli ilutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Daphne oleoides is an evergreen Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers dry or moist soil

pcista All parts of the plant are poisonous[200]. Skin contact with the sap can cause dermatitis in some people[65, 200].

kcakta There is a report that the fruit is eaten, but this report then goes on to say that they cause nausea and vomiting[2]. There is also a report that they can be distilled to make an alcoholic drink[2].

dwatta Purgative Skin VDThe roots are purgative[46, 61, 240]. An infusion of the bark and leaves are used in the treatment of cutaneous affections[240]. The leaves are also used in the treatment of gonorrhoea and are applied to abscesses[240]

nrakta S. Europe, N. Africa and W. Asia to the Himalayas. ksacta Dry open slopes in Kashmir, 1700 - 2300

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°c followed by 12 - 14 weeks at 3°c. Germination may still take another 12 months or more at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood. July/August in a frame.

nwatta Prefers a cool lime-free well-drained friable soil[1]. Plants are usually calcicole and require an acid soil[50]. Survives in any well-fed and well-drained soil in sun or part shade according to one report which also says that it is a reliable plant in most parts of the country[182]. This species is not very hardy outside the mildest areas of Britain tolerating temperatures down to about -5°c[200]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188]. The flowers have a clove-like perfume[245].

### 8.2.372 Artemisia japonica

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flat-

priklwis hpa7tmwatli xre7t hjonli

drutta Artemisia japonica is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista Although no reports of toxicity have been seen for this species, skin contact with some members of this genus can cause dermatitis or other allergic reactions in some peo-

kcakta Edible Parts: LeavesEdible Uses: Young leaves cooked. Used as a vegetable[218].

tcanta IncenseThe powder of the dried plant is used as an incense[272].

dwatta Depurative Digestive Febrifuge Skin Women's complaintsThe leaves are digestive[178]. A decoction of the leaves is said to promote a plump figure, but too much is said to be deleterious and can cause hypertension[218]. The expressed juice of the plant is used in the treatment of vaginitis[178, 218]. It is also used to treat skin diseases[272]. Theplant is used for making antitoxifying and antifebrile drugs[266].

nrakta E. Asia - China, Japan, Korea. ksacta Sunny hills and low elevations in mountains all over Japan[58]. Forest margins, waste areas, shrublands, hills, slopes and roadsides from low elevations to 3300 metres[266].

propta Seed - surface sow from late winter to early summer in a greenhouse, making sure that the compost does not dry out[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. Division in spring or autumn[200]. Basal cuttings in late spring. Harvest the young shoots when about 10 15cm long, pot up in a lightly shaded position in a greenhouse or cold frame and plant them out when well rooted.

nwatta Easily grown in a well-drained circumneutral or slightly alkaline loamy soil, preferring a warm sunny dry position[1, 200]. Established plants are drought tolerant[200]. This species is not very hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. Plants are longer lived, more hardy and more aromatic when they are grown in a poor dry soil[245]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.373 Platycrater arguta

7 tlin 10 cvuc 1 kcak 0 tcan 0 dwat 1 m hkuc hmim cvutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Platycrater arguta is a deciduous Shrub growing to 1 m (3ft 3in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers

kcakta Edible Parts: Edible Uses: TeaA tea is made from the leaves[2, 177].

tcanta MiscellanyA useful and beautiful ground cover plant[182]. An infusion of the leaves is used by Buddhists to wash or baptise statues of the Buddha[11].

nrakta E. Asia - China, Japan. ksacta Humid rocks[11]. Sparse forests or thickets in valleys, stream banks and mountain slopes at elevations of 400 - 1800 metres in Anhui, Fujian, Jiangxi and Zhejiang provinces, China[266].

propta Seed - we have no information for this species but suggest surface-sowing the seed in a greenhouse in early spring. Do not allow the compost to dry out. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out into their permanent positions in late spring. Cuttings of half-ripe wood, 5 - 8cm taken at a node

slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134]. Special Features:North American native, Naturalizing, All or parts of this plant are poisonous, Attracts butterflies, Suitable for dried flowers, Attractive flowers or blooms.

### 8.2.259 Tropaeolum leptophyllum

7 tlin 10 cvuc 2 kcak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcup hwicli hyishrasilut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Tropaeolum leptophyllum is a PERENNIAL CLIMBER growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked[1. 2, 46, 61, 105]. Large[200]. The tubers are only used in times of scarcity, when better flavoured food is not available[2].

nrakta S. America - Chile, Bolivia. ksacta Not known

propta Seed - sow early spring in a greenhouse. Prick the seedlings out into individual pots once they are large enough to handle and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer. after the last expected frosts. Division of the tubers in the autumn or spring. In cold winter areas the tubers can be harvested in the autumn after top-growth has died down and they can then be stored in a cool frost-free position until planting them out in the spring. Cuttings of basal stems in the spring[200]. Pot them up into individual pots and place them in light shade in a frame until they are established. Plant out in early summer

nwatta Requires a lime-free soil[1] and a sunny position[200]. Prefers a soil of turfy loam and peat or sandy peat and leafmould[1]. Succeeds in soils of low and medium fertility[200]. The dormant plant is hardy to about -15°c[200]. A climbing plant, it supports itself by twisting its leaf stalks around other plants etc[219]. Closely related to T. polyphyllum, differing in its tubers and climbing habit[200]. The caterpillars of the cabbage white butterfly can be a nuisance and often cause considerable damage to the leaves[219].

#### 8.2.260 Cistus creticus

Rock Rose. Cretan rockrose 7 tlin 10 cvuc 2 kcak 0 tcan 2 dwat 1 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Cistus creticus is an evergreen Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. It is noted for attracting wildlife. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves are used as a tea substitute[2, 89]. The oleo-resin obtained from the leaves and stems is used as a commercial food flavouring in baked goods, ice cream, chewing gum etc[183, 238].

tcanta ResinThe glandular hairs on the leaves yield the oleo-resin 'ladanum', used medicinally and in soaps, perfumery, fumigation etc[4, 11, 46, 61, 64, 89, 100]. This resin is an acceptable substitute for ambergris (which is obtained from the sperm whale) and so is important in perfume manufacture[238]. The resin is collected by dragging a type of rake through the plant, the resin adhering to the teeth of the rake, or by boiling the twigs and skimming off the

resin[64, 89]. Most resin is produced at the hottest time of the year[46]. There is a mauve-flowered variety of this species that is the most prolific producer of the resin[245].

dwatta Emmenagogue Expectorant StimulantThis plant is an aromatic, expectorant, stimulant herb that controls bleeding and has antibiotic effects[4, 238]. It is used internally in the treatment of catarrh and diarrhoea[4, 238] and as an emmenagogue[4]. The leaves are harvested in late spring and early summer and can be dried for later use, or the resin extracted from them[238]

nrakta Europe - Mediterranean. ksacta Amongst scrub and in bushy places on rocks, dry hills etc to 1000 metres[89]. propta Seed - gather when ripe and store dry[78]. Sur-

face sow in late winter in a greenhouse[164]. The seed usually germinates in 1 - 4 weeks at 20°c[164]. Prick out the seedlings as soon as they are large enough to handle into individual pots. Grow them on in the greenhouse for their first winter and plant them out the in the following spring or early summer, after the last expected frosts[164]. The seed stores for at least 3 years[K]. Cuttings of softish to half-ripe wood. 8cm long with a heel or at a node, June/August in a frame. Roots are formed within 3 weeks[78]. High percentage[78]. Cuttings of almost mature wood, 8 - 12cm with a heel or at a node, September/October in a frame. High percentage[78]. Lift and pot up in the spring, plant out when a good root system has formed[78]. Layering in spring.

nwatta Requires a sunny position in a dry or moist welldrained light sandy soil[11, 182]. Withstands drought once it is established[11, 184]. Tolerates maritime exposure[188, Kl. Plants are hardy to about -15°c[184], but they require protection in severe winters[11]. Plants are somewhat hardier when grown in poor soils[182]. This is usually a short-lived plant in cultivation, it probably exhausts itself by its very free-flowering habit[K]. Plants often self-sow when growing in a suitable position[166]. Dislikes pruning or root disturbance[11, 200]. Plants should be pot grown and then planted out in their final positions whilst still small. Individual flowers only last one day but there is a long succession of them[11, 200]. A polymorphic species, some forms do not yield much gum[11]. Hybridizes freely with other members of this genus. This species is notably resistant to honey fungus[88, 200]. The flowers are very attractive to bees[108]. The leaves, which exude a balsamic resin, are especially fragrant on warm sunny days[245].

#### 8.2.261 Chenopodium ambrosioides

Mexican Tea

1401

7 tlin 10 cyuc 2 kcak 3 tcan 3 dwat 1 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Chenopodium ambrosioides is a AN-NUAL/PERENNIAL growing to 1 m (3ft 3in) by 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil.

pcista The essential oil in the seed and flowering plant is highly toxic. In excess it can cause dizziness, vomiting, convulsions and even death[222, 238]. The plant can also cause dermatitis or other allergic reactions[222]. The leaves and seeds of all members of this genus are more or less edible. However, many of the species in this genus contain saponins, though usually in quantities too small to do any harm. Although toxic, saponing are poorly absorbed by the body and most pass straight through without any problem. They are also broken down to a large extent in the cooking process. Saponins are found in many foods, such as some beans. Saponins are much more toxic to some creatures. such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K]. The plants also contain some oxalic acid, which in large quantities can lock up some of the nutrients in the food. However, even considering this, they are very nutritious vegetables in reasonable quantities. Cooking the plant will reduce its content of oxalic acid. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Leaves SeedEdible Uses: TeaLeaves - cooked[2]. The tender leaves are sometimes used as a potherb[183]. Used as a condiment in soups etc[46, 61, 105], they are said to reduce flatulence if eaten with beans[183]. The leaves have a rank taste due to the presence of resinous dots and sticky hairs[85]. The raw leaves should only be eaten in small quantities, see the notes above on toxicity. Seed - cooked[105, 161]. The seed is small and fiddly, it should be soaked in water overnight and thoroughly rinsed before it is used in order to remove any saponins. An infusion of the leaves is a tea substitute[183].

tcanta Dye InsecticideThe plant is used as a fumigant against mosquitoes and is also added to fertilizers to inhibit insect larvae[238]. Gold/green dyes can be obtained from the whole plant[168].

dwatta Analgesic Antiasthmatic Antifungal Carminative Dysentery Stomachic VermifugeMexican tea is a Central American herb that has been used for centuries to expel parasitic worms from the body[254]. The whole plant is analgesic, antiasthmatic, carminative, stomachic and vermifuge[1, 4, 21, 57, 145, 147, 171]. An infusion can be used as a digestive remedy, being taken to settle a wide range of problems such colic and stomach pains[254]. Externally, it has been used as a wash for haemorrhoids, as a poultice to detoxify snake bites and other poisons and is thought to have woundhealing properties[254]. Use with caution and preferably under the supervision of a qualified practitioner[21, 238]. This remedy should not be prescribed for pregnant women[238]. See also the notes above on toxicity. Until fairly recently, this was one of the most commonly used vermifuges, though it has now been largely replaced by synthetic drugs[222]. The seed, or an essential oil expressed from the seed, was used[213]. It is very effective against most parasites, including the amoeba that causes dysentery, but is less effective against tapeworm[213, 238]. Fasting should not precede its use and there have occasionally been cases of poisoning caused by this treatment[213]. The oil is used externally to treat athlete's foot and insect bites[238]. One report says that it is an essential oil that is utilised[240]. This is obtained from the seed or the flowering stems, it is at its highest concentration in the flowering stems before seed is set, these contain around 0.7% essential oil of which almost 50% is the active vermifuge ascaridol[240]. The essential oil is of similar quality from plants cultivated in warm climates and those in cool climates [240]. The leaves are added in small quantities as a flavouring for various cooked bean dishes because their carminative activity can reduce flatulence[222].

nrakta Tropical America. Naturalized in S. Europe[50]. ksacta Mainly found on dry wasteland and cultivated ground[204, 268].

propta Seed - whilst it can be sown in situ in mid to late spring, we have had better results by sowing the seed in a cold frame in early spring. Put a few seeds in each pot and thin to the best plant if necessary. Germination rates are usually very good and the seedlings should appear within a few days of sowing the seed. Plant out in late spring, after the last expected frosts.

nwatta An easily grown plant, succeeding in most soils but disliking shade[1, 200]. It prefers a moderately fertile soil[200]. Tolerates a pH in the range 5.2 to 8.3. Plants are annuals or short-lived perennials[238]. They are not very hardy when grown outdoors in Britain and so are best grown as an annual [238]. Plants have often self-sown freely in our Cornish trial grounds, but the seed often germinates in the autumn and then does not manage to survive the winter[238]. This species is sometimes grown as a medicinal and culinary plant, especially in its native Mexico. The sub-species C. ambrosioides anthelminticum is more active medicinally and is the form most often cultivated for its vermicidal activity[238]. The bruised leaves emit an unpleasant foetid odour[245]. In garden design, as well as the above-ground architecture of a plant, root structure considerations help in choosing plants that work together for their optimal soil requirements including nutrients and water. The root pattern is fleshy. Thick or swollen - fibrous or tap root [2-1].

### 8.2.262 Cyperus aristatus

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1.5 m hkuc htut cyutli tcuphja7n hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cyperus aristatus is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. The seeds ripen from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet soil.

kcakta Edible Parts: RootEdible Uses: Tuber - raw or cooked[46, 161, 177]. A starchy flavour[61].

tcanta WeavingThe leaves are used for weaving hats, matting etc[178].

nrakta N. America to S. America. Naturalized in N. Italy[50]. ksacta Wet places in valleys and lowland all over N. America[60]. A cosmopolitan plant, it is not found at high latitudes[60].

propta Seed - surface sow in the spring and keep the compost moist[164]. The seed usually germinates in 2-6 weeks at  $18^{\circ}$ c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow on for their first winter in a greenhouse and plant them out in late spring after the last expected frosts. Division in spring or autumn. This is more a matter of harvesting the tubers and replanting them. If this is done in the autumn, then it is best to store the tubers in a cool frost-free place overwinter and plant them out in the spring.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though judging by its native range it could succeed outdoors in many parts of this country. There is some confusion over the correct name of this species, we have shown C. squarrosus as a synonym but it could be the correct name, whilst some botanists say that C. inflexus is the correct name[235]. The dried plant is fragrant[235]. The following notes are based on the general needs of the genus. Prefers a moist sandy loam[95, 117].

### 8.2.263 Fritillaria imperialis

Crown Imperial, Imperial fritillary, Crown Imperial Fritillary 7 tlin 9 cyuc 2 kcak 0 tcan 1 dwat 1 m hkuc

hmimhtut cyutli hgatkyuctcup hwicli jlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Fritillaria imperialis is a BULB growing to 1 m (3ft 3in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in flower in April, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista The bulb is poisonous raw[4, 114], it contains low concentrations of a toxic alkaloid[163, 240].

kcakta Edible Parts: RootEdible Uses: Bulb -cooked[114]. A minor source of starch[4, 105, 177]. Some caution is advised since there are reports of toxicity.

dwatta Diuretic Emollient Galactogogue ResolventThe bulb is diuretic, emollient and resolvent[240]. It is also a cardiac poison[240]. It has been used as an expectorant and also to encourage increased breast milk production[254]. The fresh plant contains the toxic alkaloid 'imperialine' [240].

nrakta W. Asia - W. Himalayas, Turkey and Iran. ksacta Cliffs, rocky slopes and amongst scrub, 1000 - 3000 metres in Turkey[90]. On humus rich soils, usually in gullies and shaded sides of large rocks, 1800 - 2600 metres in Kashmir[145].

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them

dwatta Antibacterial Cancer DysenteryBerberine, universally present in rhizomes of Berberis species, has marked antibacterial effects. Since it is not appreciably absorbed by the body, it is used orally in the treatment of various enteric infections, especially bacterial dysentery[218]. It should not be used with Glycyrrhiza species (Liquorice) because this nullifies the effects of the berberine[218]. Berberine has also shown antitumour activity[218].

nrakta Southern S. America - S. Chile. ksacta Not known propta Seed - best sown as soon as it is ripe in a cold frame, when it should germinate in late winter or early spring[78]. Seed from over-ripe fruit will take longer to germinate[78], whilst stored seed may require cold stratification and should be sown in a cold frame as early in the year as possible[80]. The seedlings are subject to damping off, so should be kept well ventilated[113]. When the seedlings are large enough to handle, prick them out into individual pots and grow them on in a cold frame. If growth is sufficient, it can be possible to plant them out into their permanent positions in the autumn, but generally it is best to leave them in the cold frame for the winter and plant them out in late spring or early summer of the following year. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current season's growth, preferably with a heel, October/November in a frame[78]. Suckers, removed in late autumn/early winter and planted out in situ or potted up and planted out in late spring[200].

nwatta Prefers a warm moist loamy soil and light shade but it is by no means fastidious, succeeding in thin, dry and shallow soils[11, 200]. Grows well in heavy clay soils. Plants are possibly hardy to about -15°c[184]. Plants can be pruned back quite severely, they resprout well from the base[200]. Hybridizes freely with other members of this genus[1]. Plants produce suckers[11].

#### 8.2.368 Bromus tectorum

Cheat Grass, Downy Brome 7 tlin 10 cyuc 1 kcak 1 tcan 1 dwat 1 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli priklwishsom hpa7tmwatli xre7t hjonli

drutta Bromus tectorum is a ANNUAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista The awns of the plant can cause mechanical injury to grazing animals[274].

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed -cooked[257]. A famine food, the small seed can be cooked into a gruel in times of food shortage[257]. A coffee is made from the roasted seed[177].

tcanta Bedding MiscellanyThe leaves have been used as a bedding[257]. B. tectorum is the most abundant forage species on many intermountain area rangelands of the USA [1d].

dwatta MiscellanyA paste made from the seeds is applied as a poultice to the chest to relieve chest pains[272].

nrakta S. Europe - Mediterranean. Naturalized in N. America. ksacta Roadsides and waste places, also in thatched roofs in Eastern N. America[43].

propta Seed - sow spring or autumn in situ and only just cover. Germination should take place within 2 weeks.

nwatta Succeeds in ordinary well-drained garden soil in a sunny position[138, 200].

### 8.2.369 Nicandra physaloides

Shoo Fl

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Nicandra physaloides is a ANNUAL growing to 1.2 m (4ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September.

The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Although no mention of toxicity has been seen for this species, it belongs to a family that contains many species of poisonous plants so some caution is advised. It is normally the leaves and the unripe fruits that are most likely to be suspect, this family also includes many food plants such as potatoes, tomatoes, peppers etc.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit[177]. No more details are given. The fruit is a berry about 15mm in diameter[200]. Young leaves - boiled[177]. Some caution is advised, see the notes above on toxicity.

tcanta RepellentThe plant is thought to repel flies[188]

dwatta Analgesic Anthelmintic Antibacterial Antiin-flammatory Diuretic Febrifuge MydriaticThe plant is directic[240]. There is no evidence to suggest that the plant is purgative, though an alkaloid with mydriatic action is present[240]. The seeds are used in Tibetan medicine, they are said to have an acrid taste and a cooling, very poisonous potency[241]. Analgesic, anthelmintic, antibacterial, anti-inflammatory and febrifuge, regular use increases bodily vigour[241]. They are used in the treatment of contagious disorders, toothache, intestinal pain from worms and impotence[241]. A decoction of the seeds is used in the treatment of fevers[272].

nrakta S. America - Peru. Introduced and casual in Britain. ksacta Naturalized in waste places and near dwellings in much of N. America[204].

propta Seed - sow in situ in late spring, preferably after the last expected frosts[200]. Young seedlings can be transplanted. The seed can remain dormant for several decades[200].

nwatta Succeeds in ordinary garden soil[1], but prefers a rich well-drained soil in a sunny position[200]. Plants withstand poor weather conditions well and do not usually require staking[200]. Plants are fast-growing[188] and often self-sow freely[200]. Individual flowers only live for one day, but the plant produces a succession of flowers from summer to early autumn[188].

#### 8.2.370 Alstroemeria aurea

Peruvian Lily

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Alstroemeria aurea is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf from February to August, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil and can tolerate drought. The plant can tolerate maritime exposure.

pcista Some people are sensitive to this plant and skin contact with the sap can cause them to get dermatitis[65].

kcakta Edible Parts: RootEdible Uses: Although no reports have been seen for this species, the root of many members of this genus are edible and a source of starch that is very nutritious. It is most likely that this species can be used in the same way.

nrakta S. America - S. Chile ksacta Moist wood-

propta Seed - best sown in individual pots in a cold frame as soon as it is ripe although seedlings can be transplanted successfully if they are moved with care whilst small. Presoak stored seed for 12 hrs in warm water, warm stratify for 4 weeks at 25°c and then reduce the temperature to 10°c. Excising a small bit of the seed near the embryo after the seed has been warm stratified helps to speed up the germination process[164]. Plant out about 20cm deep into their permanent positions in late summer or autumn[200]. Division in April or October with care since the plant resents root disturbance[133]. Ensure each portion has a growth bud[111].

htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Zygophyllum fabago is a PERENNIAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not selffertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: Edible Uses: CondimentThe flower buds are pickled and used as a caper substitute[2, 103, 105,

nrakta S.E. Europe. N. Africa to W. Asia - Svria to Afghanistan. ksacta Dry places[50].

propta Seed - sow spring in a greenhouse. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Basal cuttings in late spring. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a sunny position in a dry very welldrained soil[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.365 Polygonum equisetiforme

7 tlin 10 cvuc 1 kcak 0 tcan 0 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Polygonum equisetiforme is an evergreen Perennial growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

pcista Although no specific mention has been made for this species, there have been reports that some members of this genus can cause photosensitivity in susceptible people. Many species also contain oxalic acid (the distinctive lemony flavour of sorrel) - whilst not toxic this substance can bind up other minerals making them unavailable to the body and leading to mineral deficiency. Having said that, a number of common foods such as sorrel and rhubarb contain oxalic acid and the leaves of most members of this genus are nutritious and beneficial to eat in moderate quantities. Cooking the leaves will reduce their content of oxalic acid. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Edible Uses: TeaThe plant is used as a flavouring for tea[183]

tcanta Plants can be grown as a ground cover when spaced about 60cm apart each way[208].

nrakta Europe - Mediterranean. ksacta Chiefly ruderale[50]. Gardens, bluffs, ditches, weed-infested and slightly saline places, pastures and wormwood steppes in irrigated areas[74]

propta Seed - sow spring in a cold frame. Germination is usually free and easy. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer if they have reached sufficient size. If not, overwinter them in a cold frame and plant them out the following spring after the last expected frosts. Division in spring or autumn. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Succeeds in an ordinary garden soil[1] but prefers a moisture retentive not too fertile soil in sun or part shade[200]. Repays generous treatment[1]. Somewhat tender in Britain, it is apt to be cut back in severe winters and should be given a position in a warm sunny corner[1]. It probably tolerates temperatures down to between -5 and -10°c[200]. Plants seem to be immune to the predations of

#### 8.2.366 Datura guercifolia

Oak Leaf Datura, Chinese thorn-apple

7 tlin 10 cyuc 1 kcak 0 tcan 3 dwat 1.5 m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli xre7t hionli

drutta Datura quercifolia is a ANNUAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista All members of this genus contain narcotics and are very poisonous, even in small doses[200].

kcakta Edible Parts: FruitEdible Uses: DrinkFruit ground up and mixed with clay[161] ( the clay probably has a neutralizing effect on the toxins). A very toxic plant, its use cannot be recommended. The fruit is about 7cm long and 6cm wide[200]. A stupefying beverage is made from the leaves and roots[161].

tcanta Unlike Datura inoxia Datura quercifolia does not have much ornamental value.

dwatta NarcoticThe whole plant is narcotic[200]. It has been used in the past to deaden pain, treat insomnia etc, but any use of this plant should only be carried out under the supervision of a qualified practitioner since the difference between the medicinal dose and a toxic dose is very small.

nrakta South-western N. America - Arizona to Mexico. ksacta Roadsides, 1200 - 1800 metres in Arizona.

propta Sow the seed in individual pots in early spring in a greenhouse[200]. Put 3 or 4 seeds in each pot and thin if necessary to the best plant. The seed usually germinates in 3 - 6 weeks at 15°c. Plant out in late spring or early summer, after the last expected frosts. Especially in areas with hot summers, it is worthwhile trying a sowing outdoors in situ in mid to late spring.

nwatta Prefers a rich light sandy soil[1] and an open sunny position[200]. Grows best in a fertile calcareous soil[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This species is extremely susceptible to the various viruses that afflict the potato family (Solanaceae), it can act as a centre of infection so should not be grown near potatoes or tomatoes[200]. Closely related to D. stramonium[200].

#### 8.2.367 Berberis heterophylla

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Berberis heterophylla is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[177]. The fruits are about 6mm long[200].

tcanta DyeA yellow dye is obtained from the root.

on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta Landscape Uses:Border, Container, Massing, Seashore, Specimen, Woodland garden. Easily grown in a moderately fertile soil[90]. Prefers a heavy soil without any disturbance, not even hoeing[1, 42]. Requires a well-drained soil and a sunny position[42, 90, 200] or the shade of deciduous trees or shrubs[90]. Succeeds in drier soils and is drought tolerant once established[190]. Plants succeed in most fertile soils, avoiding pure chalk, heavy clay and boggy sites[233]. The dormant bulbs are very hardy and will withstand soil temperatures down to at least -10°c[214]. A very ornamental plant, there are some named varieties[233]. The flowers smell of wet fur and garlic[245]. Bulbs should be planted 10 - 12 cm deep in July[1] on their side with sharp sand beneath them to ensure that they do not rot[42, 200]. Special Features: Attractive foliage.

### 8.2.264 Mahonia gracilis

Mexican Barberry

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1.5 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Mahonia gracilis is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from February to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: The fruit of all members of the genus is edible either raw or cooked, though we do not know the quality of this species[K]. The ovoid fruit is produced in racemes and is up to 12mm long[200].

nrakta South-western N. America - Mexico, ksacta Dry ravines in open pine forests in limestone soils[260].

propta Seed -

nwatta Unlike most members of this genus, this species requires a dry, well-drained soil in a shady position[260]. It requires a position sheltered from strong or cold winds[202]. Plants are only hardy in the milder areas of the country, tolerating temperatures down to about -5°c when fully dormant[260]. The young growth in spring can be damaged by late frosts. Hybridizes freely with other members of this genus. Plants in this genus are resistant to honey fungus[88].

#### 8.2.265 Ephedra fragilis

7 tlin 10 cyuc 2 kcak 0 tcan 4 dwat 1.8 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Ephedra fragilis is an evergreen Shrub growing to 1.8 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH; mildly acid. neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. Sweet. The fruit is about 10mm in diameter[200].

dwatta AntiasthmaticMembers of this genus contain various medicinally active alkaloids (but notably ephedrine) and they are widely used in preparations for the treatment of asthma and catarrh[148, 238]. The whole plant can be used at much lower concentrations than the isolated constituents - unlike using the isolated ephedrine, using the whole plant rarely gives rise to side-effects[254]. The plant also has antiviral effects, particularly against influenza[238]. The stems are a pungent, bitter, warm herb that dilates the bronchial

vessels whilst stimulating the heart and central nervous system[148, 238]. The stems are also diaphoretic, diuretic, febrifuge, hypertensive, nervine, pectoral, tonic, vasoconstrictor and vasodilator[165, 176, 238]. They are used internally in the treatment of asthma, hay fever and allergic complaints[238]. They are also combined with a number of other herbs and used in treating a wide range of complaints[238]. This herb should be used with great caution, preferably under the supervision of a qualified practitioner[238]. It should not be prescribed to patients who are taking monoamine oxidase inhibitors, or suffering from high blood pressure, hyperthyroidism or glaucoma[238]. Ephedrine is seen as a performance-boosting herb and, as such, is a forbidden substance in many sporting events such as athletics[K]. The stems can be harvested at any time of the year and are dried for later use[238].

nrakta Europe - E. Mediterranean. ksacta Rocky hills and stone walls[148].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. It can also be sown in spring in a greenhouse in a sandy compost[K]. Prick out the seedlings into individual pots as soon as they are large enough to handle and grow them on for at least their first winter in a greenhouse. Plant out in the spring or early summer after the last expected frosts and give some protection in their first winter[K]. Division in spring or autumn[238]. Layering.

nwatta Requires a well-drained loamy soil and a sunny position[11]. Established plants are drought resistant and are also lime tolerant[200]. Plants are not very hardy in Britain, tolerating a few degrees of frost[200]. The report on medicinal uses refers specifically to E. fragilis campylopoda. (C.A.Meyer.) Ascherson. and Graebner. This plant is growing outdoors at Kew, probably planted in 1968, and seems to be perfectly hardy[K]. It is said to come from N. Asia which is rather confusing since the report on medicinal uses is dealing with native plants of Greece[K]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.266 Disporum cantoniense

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 1 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Disporum cantoniense is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Tender leaves and young shoots - cooked. Used as a vegetable[272].

dwatta FebrifugeThe juice of the roots is used in the treatment of fevers[272]

nrakta E. Asia - Himalayas to China. ksacta Cool shady places at elevations of 1100 - 2900 metres in Nepal[272]. Forests and thickets at elevations of 700 - 3000 metres[266].

propta Seed - best sown in a cold frame as soon as it is ripe[175]. Use a lime-free compost and keep it moist[175]. Stored seed requires 6 weeks cold stratification and should be sown as early in the year as possible[175]. Germination usually takes place within 3 - 6 months or more at 15°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[200].

nwatta Best grown in partial shade in a moist peaty or woodland soil[1, 175]. Plants spread rapidly[188] by means of creeping rhizomes when they are grown in a leafy

#### 8.2.267 Nicotiana tabacum

Tobacco, Cultivated tobacco 7 tlin 10 cyuc 2 kcak 3 tcan 2 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Nicotiana tabacum is a ANNUAL growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant are poisonous[4, 19, 65, 76]. They contain a volatile oil called nicotine, this is a virulent poison that produces nausea, vomiting, sweating, palpitations and nausea[232].

kcakta Edible Parts: Leaves OilEdible Uses: Egg OilA protein can be extracted from the leaves. It is an odour less, tasteless white powder and can be added to cereal grains, vegetables, soft drinks and other foods[183]. It can be whipped like egg whites, liquefied or gelled and can take on the flavour and texture of a variety of foods[183]. It is 99.5% protein, contains no salt, fat or cholesterol[183]. It is currently (1991) being tested as a low calorie substitute for mayonnaise and whipped cream[183].

tcanta Insecticide Oil RepellentAll parts of the plant contain nicotine, this has been extracted and used as an insecticide[20, 37, 46]. The dried leaves can also be used, they remain effective for 6 months after drying[169]. The juice of the leaves can be rubbed on the body as an insect repellent[213]. The leaves have been dried and chewed as an intoxicant. The dried leaves are also used as snuff or smoked. This is the main species that is used to make cigarettes and cigars. A drying oil is obtained from the seed[57, 171]. Dynamic accumulator.

dwatta Antispasmodic Diuretic Emetic Expectorant Homeopathy Irritant Narcotic Sedative SialagogueTobacco has a long history of use by medical herbalists as a relaxant, though since it is a highly additive drug it is seldom employed internally or externally at present[4, 254]. The leaves are antispasmodic, discutient, diuretic, emetic, expectorant, irritant, narcotic, sedative and sialagogue[4, 192, 213]. They are used externally in the treatment of rheumatic swelling, skin diseases and scorpion stings[240]. The plant should be used with great caution[4], when taken internally it is an addictive narcotic[222]. The active ingredients can also be absorbed through the skin[4]. Wet tobacco leaves can be applied to stings in order to relieve the pain[213]. They are also a certain cure for painful piles[4]. A homeopathic remedy is made from the dried leaves[232]. It is used in the treatment of nausea and travel sickness[232].

nrakta S. America. Naturalized in C. and S. Europe. ks-acta Not known in a truly wild situation.

propta Seed - surface sow in a warm greenhouse about 10 weeks before the last expected spring frosts. The seed usually germinates in 10-20 days at  $20^{\circ}c$ . Keep the soil moist and pot up as soon as the plants are big enough to handle, planting them out after the last expected frosts.

nwatta Prefers a well-drained deep rich moist soil in a sunny position[1, 200]. Plants are not very hardy in Britain, but they can be grown as biennials in areas where winter temperatures do not fall below about -5°c[200]. A polymorphic species[50]. Tobacco is very widely cultivated for its leaves, there are many named varieties[183]. As well as being used as an insecticide, the leaves are used to make cigarettes, cigars, snuff and for chewing. There are many long-term health problems associated with these uses, especially from cancer, lung, circulatory and heart diseases. The plant accumulates potassium[18]. The plant has sweetly scented flowers that release most of their scent in the evening and attract moths[30]. Plant requires more than 14 hours daylight per day in order to induce flowering[169].

#### 8.2.268 Dasylirion wheeleri

Sotol, Common sotol, Bear Grass, Common Sotol, Desert Spoon

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 1.5 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli nyanhien hionli

drutta Dasylirion wheeleri is an evergreen Tree growing to 1.5 m (5ft) at a slow rate. See above for USDA hardi-

ness. It is hardy to UK zone 9. It is in leaf all year, in flower from August to September. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Insects. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: StemEdible Uses: DrinkThe central part of the plant can be cooked and eaten[183]. The crown of the plant was baked by the native North American Indians then dried, pounded into a powder and made into cakes[257]. They would also peel the baked crown, crush it, mix it with water then ferment it and use it as a beverage[257]. The flowering stems can be roasted, boiled or eaten raw[257]. The trunk is rich in sugar, the pith can be used to make the alcoholic beverage 'sotol'[183].

tcanta Basketry Thatching WeavingThe leaves are used in thatching, basket making, weaving into hats, mats etc[257].

nrakta South-western N. America - Arizona to Texas and Mexico. ksacta Open, rocky slopes at elevations of 1200 - 1900 metres in Arizona, New Mexico, Texas and Mexico [270]

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Landscape Uses:Specimen. Requires a very well-drained soil in a sheltered sunny position[200]. This species is not very cold hardy, and is said to require a minimum winter temperature of 10°c[200], However, plants can survive outdoors in the very mildest areas of Britain if given some protection such as a south facing wall and a suitable soil[K]. Plants are sometimes used in sub-tropical bedding schemes in Britain. Special Features:Attractive foliage, North American native. Attractive flowers or blooms.

### 8.2.269 Callicarpa americana

American Beautyberry, Beautyberry, French Mulberry, American Beautyberry

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 1.8 m hkuc

hmimhtut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Callicarpa americana is a deciduous Shrub growing to 1.8 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from June to July. The species is hermaphrodite (has both male and female organs). Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[105, 177]. Juicy, sweet, fleshy, slightly aromatic[123]. The fruit is about 6mm in diameter[200].

dwatta Diuretic Dysentery MalariaA decoction of the root bark has been used as a diuretic[257]. The leaves are a cure for dropsy[61]. A tea made from the roots is used in the treatment of dysentery and stomach aches[222, 257]. A tea made from the roots and berries is used in the treatment of colic[222, 257]. Some native North American Indian tribes used the leaves and roots in sweat baths for the treatment of malaria, rheumatism and fevers[222, 257].

nrakta South-eastern N. America - Florida to Texas and north to Oklahoma and Arkansas. ksacta Rich woods and thickets[43].

propta Seed - sow February in a greenhouse[78]. Only just cover the seed[138]. Germination usually takes place within 1 - 3 months at 18°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10cm long, July/August in a frame. High percentage[78]. Cuttings of mature wood of the current season's growth with a heel[78] taken in early spring[200].

for the treatment of hysteria, convulsions, colic, uterine diseases and obstructions of the bile duct[61, 272]. They are given to children as a blood purifier[240]. The seeds are cathartic and emetic[240, 272]. An infusion of the dried flowers is useful in the treatment of diarrhoea[240]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - Himalayas from Pakistan to W. Nepal. ksacta Forest and scrub, often gregarious, 1800 - 2500 metres[51, 187]

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250]. nwatta Requires a deep rich soil, preferably neutral or

slightly alkaline[1], doing guite well in sun or light shade[1]. 200]. It is best grown amongst shrubs[200], doing better when given some shade[233]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Many gardeners have difficulties growing this plant in their gardens, though it thrives in the outdoor beds at the Royal Botanical Gardens, Edinburgh[250]. Probably giving it the protection of shrubs or a woodland edge is likely to be most successful[250]. Plants are hardy to about -20°c[187]. A very ornamental[1] and long-lived plant, specimens can survive in the garden for at least 50 years[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from

### 8.2.362 Hedychium spicatum

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hedychium spicatum is a PERENNIAL growing to 1.5 m (5ft) by 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit cooked[177]. Eaten in savoury dishes with lentils[183].

tcanta Essential IncenseThe rootstock yields 4% essential oil[240]. This oil, which has a scent somewhat like hyacinths, is so powerful that a single drop will render clothes highly perfumed for a considerable period[245]. The dried root is burnt as an incense[245].

dwatta Carminative Digestive Emmenagogue Expectorant Stimulant Stomachic Tonic VasodilatorThe rootstock is

carminative, emmenagogue, expectorant, stimulant, stomachic and tonic[240, 243]. It is useful in the treatment of liver complaints, and is also used in treating fevers, vomiting, diarrhoea, inflammation, pains and snake bite[240, 243, 272]. The root is used in Tibetan medicine, it is said to have an acrid taste and heating potency[241]. It is digestive, stomachic and vasodilator[241]. It is used in the treatment of indigestion and poor circulation due to thickening of the blood[241].

nrakta E. Asia - Himalayas. ksacta Forest clearings, shrubberies, 1800 - 2800 metres[90] from Himachal Pradesh to Arunachal Pradesh.

propta Seed - best sown as soon as it is ripe in a warm greenhouse at  $18^{\circ}$ (2001. Prick out the seedlings into individual pots when they are large enough to handle and grow them on for at least their first winter in the greenhouse. Plant out in late spring after the last expected frosts. Division as growth commences in the spring[2001. Dig up the clump and divide it with a sharp spade or knife, making sure that each division has a growing shoot. Larger clumps can be planted out direct into their permanent positions, but it is best to pot up the smaller divisions and grow them on in a greenhouse until they are established. Plant them out in the summer or late in the following spring.

nwatta Requires a rich moist soil and a sunny position[233]. They can be grown in a sunny border as a summer sub-tropical bedding plant[[1]. Plants are not very coldhardy, tolerating temperatures down to about -2°c. They can be grown at the foot of a south-facing wall if given a good mulch in the winter[1, 200]. Plants succeed outdoors in Tresco Gardens, Isles of Scilly, This species succeeds outdoors in most parts of S. England, especially if the rhizomes are mulched with dry leaves in the autumn[90]. Plants have been known to withstand temperatures down to -16°c in Germany[214]. Plants seem to be immune to the predations of rabbits[233]. The tubers should only just be covered with soil[233]. The flowers are sweetly scented, the scent being most pronounced towards evening[245]. Both the bruised and the dried root are very aromatic with a fragrant, somewhat pungent smell that is similar to orris root but more powerful[245].

### 8.2.363 Arthropodium cirrhatum

Dools lile

7 tlin 10 cvuc 1 kcak 0 tcan 0 dwat 1 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Arthropodium cirrhatum is an evergreen Perennial growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Rhizome - cooked[173, 177].

nrakta New Zealand ksacta Rocky cliffs near the sea, often in colonies, on North and South Islands north of latitude  $42^{\circ} \ 30' \ s[44]$ 

propta Seed - sow late winter in a cold greenhouse. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in a greenhouse. Plant out in late spring or early summer, after the last expected frosts. Division in spring.

nwatta Prefers a well-drained sandy peaty loam in a warm, sheltered sunny position[200]. Grows best in a rich leafy soil[260]. Plants are not very cold-hardy, tolerating temperatures down to about -3°c[260]. They can succeed outdoors in the milder areas of Britain, but they are best grown in a cold greenhouse in this country[200]. A polymorphic species[200]. This plant was possibly formerly cultivated for its edible root by the Maoris, the root grows larger under cultivation[173].

### 8.2.364 Zygophyllum fabago

Syrian Bean Caper

1437

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1.2 m hkuc

drutta Coprosma virescens is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but with little flavour[225]. The white fruit is about 5mm in diameter[225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Lowland to lower montane forest and shrubland, North and South Islands[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[X]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the mildest areas of Britain[200]. Another report says that it is proving to be hardy in an Essex garden[225]. Hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

### 8.2.359 Oenanthe pimpinelloides

Meadow Parsley, Corkyfruit waterdropwort 7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc

htut cyuli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Oenanthe pimpinelloides is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist or wet

pcista Many species in this genus are very poisonous, one report has been found so far saying that this species is also poisonous[76]. It is said to contain the alleged 'psychotroph' myristicine[218].

kcakta Edible Parts: RootEdible Uses: Root[2, 105]. Starchy with a flavour somewhat like filberts, is much esteemed in some areas[4, 183]. Some caution is advised since many members of this genus are very poisonous, see the notes above on toxicity.

nrakta Europe, including Britain, from Belgium south and east to Spain and W. Asia ksacta Meadows and damp grassy places[17].

propta Seed - sow spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in spring or autumn. Very easy, large divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer.

nwatta Requires a moist or wet fertile soil in a sunny position. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and  $-10^{\circ}$ c[200].

### 8.2.360 Paris polyphylla

Herb Paris

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 1 m hkuc pcimhmim cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli dyatxre7t hjonli

drutta Paris polyphylla is a PERENNIAL growing to 1 m (3ft 3in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

pcista Poisonous[4].

kcakta Edible Parts: SeedEdible Uses: Seed[105]. A sweet flavour, but mawkish[2].

dwatta Analgesic Anthelmintic Antiphlogistic Antispasmodic Antitussive Depurative Febrifuge NarcoticThe roots
are analgesic, antiphlogistic, antipyretic, antispasmodic, antitussive, depurative, febrifuge and narcotic[4, 147, 176,
218]. They posses anthelmintic properties[243]. A decoction of the roots is used in the treatment of poisonous snake
bites, boils and ulcers, diphtheria and epidemic Japanese B
encephalitis[147]. A paste of the roots is used as a poultice to
treat cuts and wounds[272]. The juice of the roots has been
used as an anthelmintic[272]. The roots have shown antibacterial action against Bacillus dysenteriae, B. typhi, B. paratyphi, E. coli, Staphylococcus aureus, haemolytic streptococci,
Meningococci etc[176]. The whole plant is febrifuge[218].

nrakta E. Asia - China to the Himalayas. ksacta Broad-leaved and mixed woodlands to 3000 metres in the Himalayas[51, 200]. Forests, bamboo forests, thickets, grassy or rocky slopes and streamsides, 100 - 3500 metres in western China[266].

propta Seed - best sown as soon as it is ripe in late summer in light shade in a greenhouse. Sow stored seed in a greenhouse as soon as it is received. The seed is very slow to germinate. It produces a primary root about 7 months after sowing, this pulls the seed deeper into the soil. Leaves are produced about 4 months later [137]. Sow the seed thinly in fairly deep pots so that the seedlings can be grown on for their first two years without disturbance. Once they have germinated, give them a regular weak liquid feed to ensure that they do not suffer from nutrient deficiency. Once the plants are dormant at the end of their second year of growth, divide them up and put one plant in each pot. Grow them on for at least another year in a shady part of the greenhouse before planting them out into their permanent positions. Division

nwatta Easily grown in a moist humus-rich soil in wood-land conditions, succeeding in full or partial shade[90, 200, 233]. Prefers a light sandy loam[42]. This species is hardy to about -15°c according to one report[200], though another says that plants only succeed outdoors in southern and western Britain[42]. Overcollection of this plant from the wild for medicinal purposes is a cause of conservation concern[272]. A very variable species, with a large number of subspecies recognised[266]. Plants are very slow to flower from seed[137]. The individual flowers are very long-lived, lasting for up to 3 months[200, 233].

#### 8.2.361 Paeonia emodi

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Paeonia emodi is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in March. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked[105, 146].

dwatta Antispasmodic Blood purifier Cathartic Cholagogue Emetic Uterine tonicThe tubers are a useful medicine nwatta Landscape Uses:Border, Cascades, Erosion control, Foundation, Pest tolerant, Massing, Standard. Requires a sunny position or light dappled shade[1, 200]. Prefers a highly fertile well-drained loamy soil[200]. This species is hardy to about -18°c according to one report[200] whilst another says that it is only really hardy in the milder parts of Britain, though some forms should prove to be hardier[1]. Requires cross-pollination for good fruit production[182]. Plants in this genus are notably resistant to honey fungus[200]. Special Features: Attracts birds, North American native, Fragrant foliage, Naturalizing, Attracts butterflies, Inconspicuous flowers or blooms.

### 8.2.270 Ophrys tenthredinifera

Sawfly Orchid

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Ophrys tenthredinifera is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe - Mediterranean. ksacta Calcareous soils in open places in scrub to 1200 metres[230].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, how ever[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants pre-

fer a shady position[188]. Orchids are, in general, shallowrooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials [230]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

#### 8.2.271 Coprosma brunnea

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma brunnea is an evergreen Shrub growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable PH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw[128]. Sweet, but with little flavour[225]. The fruit is white or blue and up to 8mm long x 6mm wide[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153]. An excellent medium-height ground cover[200].

nrakta New Zealand. ksacta Lowland to higher montane river beds, open grassland and rubbley places on North, South and Stewart Islands[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils, so long as they are well-drained[225]. Very tolerant of maritime exposure[200]. Somewhat intolerant of frost[200], this species is hardy at Kew but it prefers milder winters[11]. It does not succeed in the colder areas of the country[11]. Fruits are freely produced in Ireland[11]. Does well on a sunny ledge in the rock garden[11, 182]. Hybridizes freely with other members of this genus[200, 225], especially C. petriei[225]. There are several named forms, selected for their ornamental value[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

### 8.2.272 Commelina elliptica

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Commelina elliptica is a PERENNIAL growing to 0.1 m (0ft 4in). See above for USDA hardiness. It is

hardy to UK zone 8. It is in flower from July to September, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: The following use is for the closely related C. tuberosa, but is also probably appropriate for this species[K]. Tubers - cooked. Rich in starch[105, 177], but with a fairly bland flavour.

nrakta South-western N. America - mountains of Mexico and south to Peru and Bolivia. ksacta Not known

propta Seed - sow March in a greenhouse. The seed usually germinates in 4 - 5 weeks at 20°c[164]. When they are large enough to handle, prick the seedlings out into individual pots plant them out in late spring or early summer, after the last expected frosts. Division in early spring. Make sure that each portion has at least one growing bud[111, K]. Cuttings during the growing season. Very easy[200].

nwatta Prefers a light well-drained loam with added leafmold[42]. Succeeds in an ordinary, reasonably moist soil in a sunny position with some shelter[164]. Plants are hardy to about -10°c if the roots are protected from freezing[187]. The roots are best dug up in the autumn and stored like dahlias in a cool frost free place[200]. When grown in a light well-drained soil and mulched well, the roots usually survive the winter outdoors[1]. This species is closely related to C. tuberosa[200].

### 8.2.273 Oxalis corymbosa

Lilac Oxalis, Pink woodsorrel 7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Oxalis corymbosa is a PERENNIAL growing to 0.2 m (Oft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist

pcista The leaves contain oxalic acid, which gives them their sharp flavour. Perfectly all right in small quantities, the leaves should not be eaten in large amounts since oxalic acid can bind up the body's supply of calcium leading to nutritional deficiency. The quantity of oxalic acid will be reduced if the leaves are cooked. People with a tendency to rheumatism, arthritis, gout, kidney stones or hyperacidity should take especial caution if including this plant in their diet since it can aggravate their condition[238].

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Leaves and leafstalks - raw or cooked[144]. Use in moderation, see notes at top of sheet. Flowers - raw. A pleasant acid flavour, they make an ornamental addition to a mixed salad[K]. Root - raw. Sweet, crisp and succulent[144, 177].

nrakta S. America. Naturalized in Britain. ksacta A weed of disturbed ground and gardens in Britain, especially near London[17].

propta Seed - best sown as soon as ripe in a cold frame. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in late spring or early summer. Division in spring. Larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early

nwatta Easily grown in a sandy soil in a warm dry position[1]. Plants are not very hardy in Britain according to one report which lists this plant as succeeding in climatic zone 9 and thus only tolerating occasional light frosts[200]. However, it is naturalized in parts of Britain, especially near London[17]. It is growing well in our Cornwall site, where it has proved to be hardy since 1994[K].

#### 8.2.274 Achyranthes bidentata

7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Achyranthes bidentata is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist

pcista One report suggests that the root is poisonous[179].

kcakta Edible Parts: Leaves SeedEdible Uses: Seed cooked. A good substitute for cereal grains in bread-making, they have often been used for this purpose in famine years 2, 177, 238]. The light brown oblong seed is about 1mm long[266]. Leaves - cooked[177, 178]. Used as a vegetable in the same manner as spinach[179].

tcanta Insecticide TeethTwo insect-moulting hormones are found in the roots[174]. Can this have a practical application as an insecticide? The stem of the plant is used as a toothbrush that is said to be good for the teeth and is also a treatment for pyorrhoea[272].

dwatta Anodyne Antiasthmatic Antiinflammatory Antirheumatic Bitter Digestive Digretic Emmenagogue Odontalgic VasodilatorThe roots, leaves and stems are widely used in Chinese herbal medicine[238]. The roots contain triterpenoid saponins, sitosterol and sigmasterol[283]. They are anodyne, antiinflammatory, antirheumatic, bitter, digestive, diuretic, emmenagogue and vasodilator[238, 283]. They act predominantly on the lower half of the body and are used in the treatment of aching back and knees and asthenia of the lower limbs[176, 238, 254]. Research suggests that they can cause dilation of the cervix and so this herb should not be used when pregnant[238]. The herb is taken internally to treat hypertension, back pains, urine in the blood, menstrual pain, bleeding etc[238, 283]. It lowers blood cholesterol levrels and so is used in the treatment of atherosclerosis[283]. The root juice is used in Nepal in the treatment of toothache[272]. This juice is also used in the treatment of indigestion and is considered to be a good treatment for asthma[272]. The stem of the plant is used as a toothbrush that is said to be good for the teeth and is also a treatment for pyorrhoea[272]. The plant can be used fresh or dried. The leaves and stems are harvested in the summer and are usually crushed for their juice or used in tinctures[238]. The roots are harvested from 1 or 2 year old plants in the autumn or winter and usually dried and ground into a powder or used in decoctions[238].

nrakta E. Asia - China, Japan, India. ksacta Forest edges, the sides of streams and shrubberies[254]. Moist shady places at elevations of 1200 - 3000 metres in Nepal[272].

propta Seed - sow late spring in a greenhouse. Germination should be fairly rapid, prick out the seedlings into individual pots of fairly rich soil when they are large enough to handle. It is probably wise to grow this plant on in the greenhouse for its first winter, planting it out into its permanent position in late spring after the last expected frosts.

nwatta Prefers a rich, sandy, slightly acid soil in partial shade[238]. This species is probably not hardy in the colder areas of the country, it tolerates temperatures down to at least -5°c[238]. When grown in a rich soil the roots can be up to 1.2 metres long[238]. Widely cultivated in China, especially in Henan Province, as a medicinal plant[238] and as a food plant[179].

#### 8.2.275 Commelina tuberosa

Commelina

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Commelina tuberosa is a PERENNIAL growing to 0.1 m (Oft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September, and the seeds ripen from August to October. The species neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: SeedEdible Uses: Seed - used as a flour[105]. A famine food, they are only used when all else fails[177]

tcanta Dye Hedge HedgePlants can be used for informal hedging in areas that are frost free or almost so[200]. A brown dye is obtained from the bark[46, 61].

nrakta E. Asia - Japan. ksacta Thickets near the seashore, C. and S. Japan[58].

propta Seed - best sown as soon as it is ripe in a shady position in a warm greenhouse [78]. Stored seed should be sown in February/March in a warm greenhouse[78]. Germination is variable [78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5cm with a heel, September/October in a frame. Fair percentage[78, 113]. Layering[200].

nwatta Requires a well-drained moisture retentive fertile loam or peaty soil in a warm sheltered sunny position[11, 200]. Prefers a position in light shade[202]. An easily grown plant but it is intolerant of dry cold[184]. Judging by its habitat, it should be fairly tolerant of maritime exposure[58]. Plants are tolerant of sea spray[245]. Tolerating temperatures down to about -15°c[200], it is normally hardy at Kew[1]. A polymorphic species[58], there are some named varieties selected for their ornamental value [200]. The plant bears honey-scented hawthorn-like blossoms[245]. Plants do not require pruning[182]. They are of slow to moderate growth rate[202]. Plants resent root disturbance and so are best grown in pots and then planted out into their permanent positions as soon as possible[200].

#### 8.2.356 Ferula communis

Giant Fennel

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 2.5 m hkuc htut cyutli hgatkyuctcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Ferula communis is a PERENNIAL growing to 2.5 m (8ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. The plant is selffertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought

kcakta Edible Parts: LeavesEdible Uses: Gum-Leaves[183]. No further details are given.

tcanta Furniture Gum Miscellany TinderA gum 'Gum Ammoniac' is obtained by notching the root [46, 61, 64, 100]. It is used as an incense[4], it also has medicinal value[1]. The stems are used in furniture making[89]. The dried pith is used as a tinder, it burns very slowly inside the stem and can thus be carried from one place to another[89, 100, 148].

dwatta MiscellanyOne report says that the root yields a gum with medicinal properties but no details are given[1].

nrakta Europe - Mediterranean, ksacta Dry hills, walls, waste ground and limestone[89], often in soils that are damp in the spring[187]

propta Seed - best sown as soon as the seed is ripe in a greenhouse in autumn[1]. Otherwise sow in April in a greenhouse. Prick out the seedlings into individual pots as soon as they are large enough to handle. Plant them out into their permanent positions whilst still small because the plants dislike root disturbance[1]. Give the plants a protective mulch for at least their first winter outdoors. Division in autumn. This may be inadvisable due to the plants dislike of root dis-

nwatta Succeeds in most soils[1] including dry ones according to one report[190] whilst others say that it requires a deep moist fertile soil in a sunny position[111, 200]. Established plants are drought resistant[190]. This species is hardy to about -10°c, possibly lower if the rootstock is mulched in the winter[187]. A very ornamental plant[1], though the flowers have a most unpleasant rancid smell[245].

Plants are often monoecious[187]. Plants are intolerant of root disturbance due to their long taproot[200]. They should be planted into their final positions as soon as possible. The sub-species brevifolia is the form used for its gum[1, 46, 61,

### 8.2.357 Edgeworthia papyrifera

Paperbush, Oriental Paperbush

7 tlin 10 cyuc 1 kcak 4 tcan 0 dwat 2.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Edgeworthia papyrifera is a deciduous Shrub growing to 2.5 m (8ft) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from February to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist

kcakta It is used to make edible rice paper.

tcanta Paper StringA high-class paper is made from the bark[1, 11, 58, 61, 200]. The bark fibres are used[61]. The stems are harvested in spring or early summer, the leaves are removed and the stems steamed until the fibres can be stripped. The outer bark is removed from the inner by peeling or scraping. The fibres are cooked for 2 hours with soda ash and then beaten with mallets or put through a blender. The paper is off white in colour[189]. The stems are extremely supple and can be tied in knots[11, 182]. It is used to make edible rice paper. Carbon Farming Solutions - Industrial Crop: fiber (Crops grown for non-food uses. Industrial crops provide resources in three main categories: materials, chemicals, and energy. Traditional materials include lumber and thatch, paper and cardboard, and textiles) [1-1].

nrakta E. Asia - China. ksacta Forests and streamsides, at elevations of 300 - 1600 metres in Ichang Province[109,

propta Seed - best sown as soon as it is ripe in a cold frame. Place the pot in a plastic bag to keep it moist[175]. The seed might germinate in the spring, though it could take another 12 months. Stored seed usually requires 8 -12 weeks warm stratification at 20°c followed by 12 - 14 weeks at 3°c[175]. Germination can still take 12 months or more at 15°c[175]. Prick out the seedlings into individual pots as soon as they are large enough to handle, and grow on in a greenhouse for at least a year before planting out in late spring or early summer[175]. Consider giving the plants some protection from the cold for their first winter outdoors. Cuttings in spring. Cuttings of half-ripe wood, July/August in a frame[200]

nwatta Industrial Crop: Fiber Management: Coppice-Climate: warm temperate to subtropical. Humidity: humid. Succeeds in any soil in sun or part shade[175, 184, 200], growing well in light woodland[200]. Prefers a welldrained soil with plenty of moisture in the growing season[1, 200]. Plants are hardy to about -15°c according to one report[184], whilst others say that it is only hardy in the milder areas of Britain[1, 11]. It succeeds on a wall at Kew[K] and as a free-standing shrub in Cornwall[11]. The flowers are damaged by frost, so the plant is best grown on a south or west-facing wall[188]. Plants resent root disturbance and should be put into their permanent positions as soon as possible[188]. Cultivated in Japan for the paper that can be made from the bark[11, 200]. The stems are harvested every second year[61]. This species is very closely related to and scarcely distinct from E. gardneri and E. chrysantha[200]. The flowers diffuse a pronounced clove-like perfume and will scent the air to some distance on a calm day[245]. Carbon Farming Solutions - Cultivation: regional crop: Management: coppice (Describes the non-destructive management systems that are used in cultivation) [1-1].

### 8.2.358 Coprosma virescens

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Lowland to lower montane forest and shrubland, North, South and Stewart Islands[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Another report says that plants are reasonably hardy in Britain[225]. A polymorphic species[44], it hybridizes freely with other members of this genus[200, 225]. Plants are tolerant of heavy clipping or pruning[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

#### 8.2.353 Ericameria nauseosa

Rubber Rabbithrush

7 tlin 9 cyuc 1 kcak 3 tcan 2 dwat 2 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli hjonli

drutta Ericameria nauseosa is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: Edible Portion: Chewing gum, tea. A gum obtained from the root is used for chewing[46, 61, 95, 257].

tcanta The plant is a source of latex, used in making rubber[46, 61, 95]. There is no commercially viable method of extracting it as yet[212]. This species has been identified as one of the more promising species from western N. America for the production of biocrude (hydrocarbon and hydrocarbon-like chemical fraction of plants which may be extracted by organic solvents and upgraded to liquid fuels and chemical feedstocks). Finding the cyclohexane extract to be 15.1%, the ethanol extract 20.8%, McLaughlin and Hoffmann (1982) calculated 13.2 kBTU/lb, in the extractables, a biomass yield of ca 4.5 MT/ha or 12.5 bbls, at a per barrel cost of 50.00or13.10/million BTU[269]. The leaves have been used as a sanitary towel, especially after childbirth[257]. A green dye is obtained from the bark[168]. A yellow-gold dye is obtained from the flowers[95, 168]. The growing plant repels insects[99]. The cottony fruiting heads are used as a stuffing material for pillows etc[99]. Along with associated species, like big sage and western wheat grass, rubber rabbitbrush is a significant source of food for browsing wildlife on winter ranges. An ornamental xeriscaping shrub. Carbon Farming - Industrial Crop: hydrocarbon.

dwatta A decoction of the twigs has been used in the treatment of toothaches, coughs and chest pains[257]. An infusion of the flowering stems has been used in the treatment of colds and TB[257]. An infusion of the leaves and stems has been used to treat colds, diarrhoea, stomach cramps etc[257] l. It has also been used externally as a wash for sores and skin eruptions, especially smallpox[257]. The plant shows slight bactericidal activity[269 ]. In small doses, the extracts lowered the blood pressure briefly in rabbits. In large doses, the fall in blood pressure was pronounced, accompanied by circulatory and respiratory failure[269].

nrakta Western N. America - Canada to California. ksacta It is a temperate plant. Dry sandy, gravelly, or heavy

clayey and alkali soils in open places in sagebrush, juniperpinyon and ponderosa-pine zones at low elevations and occasionally found at higher elevations[60, 269].

propta Seed - we have no information for this species but suggest sowing the seed in spring in a greenhouse and only just covering the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, mid summer in sand in a frame[200].

nwatta Experimental Crop Industrial Crop: Hydrocarbon Management: CoppiceThis species thrives on poor soils and so is an indication that the land is poor, has been allowed to erode, has been overgrazed or in other ways neglected[212]. It is also reported to tolerate alkaline conditions, drought, heavy clays and poor soils[269]. The following notes are based on the general needs of the genus. Requires a sunny position and prefers a well-drained sandy soil[1, 11]. Plants do not require a rich soil[11]. They tolerate alkaline soils[200 ]. The sub-species C. nauseosus ssp., consimilis, is characteristic of sites with highly saline soils[269]. Climate: boreal to warm temperate. Humidity: semi-arid. Carbon Farming - Cultivation: experimental. Management: coppice.

#### 8.2.354 Osteomeles schwerinae

7 tlin 10 cvuc 1 kcak 0 tcan 0 dwat 2 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Osteomeles schwerinae is an evergreen Shruh growing to 2 m (6ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[105]. The white fruit has a sweet flavour[2]. The fruit is about 8mm in diameter[200]

nrakta E. Asia - W. China in Yunnan and W. Sichuan. ksacta By streams and in hot dry river valleys, 350 - 2000 metres[109, 200]. Among shrubs, slopes, fields, roadsides and mixed forests at elevations of 1500 - 3000 metres[266].

propta The seed requires a period of cold stratification and can be sown in late autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Pot up in the autumn and overwinter in a greenhouse. Fair to good percentage[78]. Layering.

nwatta Succeeds a sheltered position in full sun in any fertile well-drained soil[166, 182, 188]. Plants usually require protection outside the mildest areas of Britain[11], they are hardy to about -5°c, though the sub-species O. schwerinii microphylla. Rehder, and Wils, is hardier to about -10°c[184]. This sub-species is often mistakenly sold under the name O. subrotunda[219]. They can be grown on a sunny wall[11]. Seed is seldom set in Britain[219].

#### 8.2.355 Rhaphiolepis umbellata

Japanese Hawthorn

1434

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 2.5 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Rhaphiolepis umbellata is an evergreen Shrub growing to 2.5 m (8ft) by 2.5 m (8ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid,

is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Tubers - cooked. Rich in starch[105, 177], but with a fairly bland flavour.

nrakta Southern N. America - Mexico. ksacta Not known

propta Seed - sow March in a greenhouse. The seed usually germinates in 4 - 5 weeks at 20°c[164]. When they are large enough to handle, prick the seedlings out into individual pots plant them out in late spring or early summer, after the last expected frosts. Division in early spring. Make sure that each portion has at least one growing bud[111, K]. Cuttings during the growing season. Very easy[200].

nwatta Prefers a light well-drained loam with added leafmold[42]. Succeeds in an ordinary, reasonably moist soil in a sunny position with some shelter [164]. Plants are hardy to about -10°c if the roots are protected from freezing[187]. It is probably best to dig up the roots in autumn and stored them like dahlias in a cool frost free place[200]. When grown in a light well-drained soil and mulched well, the roots usually survive the winter outdoors[1]. A very ornamental plant[1].

### 8.2.276 Origanum dictamnus

Dittany Of Crete, Hop Marjoram

7 tlin 9 cvuc 2 kcak 0 tcan 1 dwat 0.2 m hkuc htut cyutli kyuctcup hwicli hrasilutnyik hpa7tli flatprikl-

wisslip hpa7tmwatli xre7t hjonli

drutta Origanum dictamnus is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.4 m (1ft 4in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil

kcakta Edible Parts: LeavesEdible Uses: Condiment TeaThe leaves are used for flavouring salads and vermouth[183, 238]. A pleasant aromatic flavour, especially when mixed with parsley, thyme, garlic, salt and pepper[183]. The flowering tops are dried and brewed into a herb tea[183, 238].

dwatta Antirheumatic Oxytoxic Stomachic VulneraryThe flowering plant has been used as an antirheumatic, oxytocic. stomachic and vulnerary[148], though these uses appear to be obsolete in modern herbalism[238]..

nrakta S. Europe - Crete. ksacta Shady rocks in dry places in high mountains[50, 148].

propta Seed - sow early spring in a greenhouse at 10 -13°c and only just cover the seed. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. The seed can also be sown in situ in late spring. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal cuttings of young barren shoots in June. Very easy. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Landscape Uses:Border, Container. Requires a rather dry, warm, well-drained soil, but is not fussy as to soil type, thriving on chalk[1]. Prefers slightly alkaline conditions[1]. This species is not fully hardy in Britain according to one report[1] whilst another says that it is hardy to zone 7[200], which means that it can succeed outdoors in most parts of the country. It is, however, very susceptible to winter wet and so is more commonly grown under cover in this country[238]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attractive foliage, Fragrant foliage, Suitable for dried flowers.

### 8.2.277 Abronia fragrans

Snowball Sand Verbena

7 tlin 10 cvuc 2 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli

drutta Abronia fragrans is a PERENNIAL growing to 0.6 m (2ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: Root cooked[46]. Dried then ground into a powder and mixed with corn[61, 105, 161]. Use of the root was said by some North American Indian tribes to give one a good appetite and make

dwatta Cathartic Diaphoretic EmeticThe plant is cathartic, diaphoretic and emetic[257]. The roots and flowers were used by the North American Indians to treat stomach cramps and as a general panacea or 'life' medicine[257]. A cold infusion was used as a lotion for sores or sore mouths and also to bathe perspiring feet[257].

nrakta South-western N. America - South Dakota to Nebraska, Colorado, Texas and Mexico ksacta Dry sandy soils, scrub and grasslands at elevations of 400 - 2000 metres[60. 235, 2701,

propta Seed - sow autumn or early spring very shallowly in pots of sandy soil in a greenhouse[133]. Germination can be very slow unless you peel off the outer skin and pre-soak the seed for 24 hours in warm water[200, 245]. The seed usually germinates in 1 - 2 months at 15°c[133]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Seedlings are prone to damp off and so should be kept wellventilated[200]. Plant out in late spring, after the last expected frosts. Cuttings in spring, rooted in sand[200].

nwatta Prefers a light well-drained sandy soil in full sun[200]. This species is not very hardy in Britain, though it should succeed outdoors in the southern part of the country, especially if given a warm sheltered site [200]. The flowers are produced in terminal clusters, they only open in the coolness of the evening, diffusing a vanilla-like perfume[245]. Seed is rarely ripened on plants growing in Britain[1].

### 8.2.278 Helichrysum italicum

1407

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Helichrysum italicum is an evergreen Shrub growing to 0.6 m (2ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Edible Uses: Condiment TeaLeaves used as a flavouring in salads and cooked foods[183, 238, 244]. They have a slight flavour of curry, though they do not impart this very well to other foods[K]. An essential oil (from the leaves?) is used as a flavouring to enhance fruit flavours in sweets, ice cream, baked goods, soft drinks and chewing gum[183]. A tea is made from the flower heads[183].

tcanta Hedge HedgePlants can be grown as a low hedge, the subspecies H. italicum serotinum(Boiss.)P.Fourn. is normally used[29]. It responds well to trimming.

nrakta S. Europe, ksacta Arid hills, rocks and cliffs[190] propta Seed - sow February/March in a greenhouse. The seed usually germinates in 2 - 3 weeks at 20°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5cm with a heel, June/July in a frame. Roots in 4 weeks. Good percentage[78].

nwatta Requires a light well-drained soil in a sunny sheltered position[1, 200]. Intolerant of excessive moisture[1]. Established plants are drought resistant[190]. Plants have proved to be fairly wind tolerant in an exposed site in Cornwall (Kl. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°c[200]. Plants can be pruned back to the old wood in spring in order to maintain the shape of the plant and promote lots of new growth[238]. The whole plant smells of curry, especially after rain[238]. The flowering stems are often dried and used as 'everlasting flowers'[238]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 8.2.279 Fritillaria thunbergii

he Bei Mu

7 tlin 10 cyuc 2 kcak 0 tcan 3 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Fritillaria thunbergii is a BULB growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Bulb-fried or candied[177]. The bulb is up to 3cm in diameter[266]. Young plants and buds - cooked[177].

dwatta Antitussive Expectorant FebrifugeThe bulbs are antidote, antitussive, astringent, expectorant, galactogogue and purgative[147, 174, 176, 218]. They contain fritimine which diminishes excitability of respiratory centres, paralyses voluntary movement and counters effects of opium[61]. The bulbs are thought to act specifically on tumours and swellings of the throat, neck and chest, and they are taken in the treatment of thyroid gland nodules, scrofula, abscesses and boils and breast cancer[254]. The bulb is used internally in the treatment of coughs, bronchitis, pneumonia, feverish illnesses, abscesses etc[238]. The bulbs also have a folk history of use against cancer of the breast and lungs in China[218, 238]. This remedy should only be used under the supervision of a qualified practitioner, excessive doses can cause breathing difficulties and heart failure[238]. The bulbs are harvested in the winter whilst they are dormant and are dried for later use[238].

nrakta E. Asia - E. China. ksacta Bamboo forests, shady and moist places from near sea level to 600 metres[163, 266].

propta Seed - best sown as soon as ripe in a cold frame, it should germinate in the spring[1]. Protect from frost[134]. Stored seed should be sown as soon as possible and can take a year or more to germinate[134]. Sow the seed quite thinly to avoid the need to prick out the seedlings. Once they have germinated, give them an occasional liquid feed to ensure that they do not suffer mineral deficiency. Once they die down at the end of their second growing season, divide up the small bulbs, planting 2 - 3 to an 8cm deep pot. Grow them on for at least another year in light shade in the greenhouse before planting them out whilst dormant. Division of offsets in August[1]. The larger bulbs can be planted out direct into their permanent positions, but it is best to pot up the smaller bulbs and grow them on in a cold frame for a year before planting them out in the autumn. Bulb scales[163].

nwatta Best grown in a moist peaty soil in the open garden[90]. Easily grown in a moderately fertile soil in sun or semi-shade[200]. Succeeds in drier soils and is drought tolerant when established[190]. The dormant bulbs are fairly hardy and will withstand soil temperatures down to at least 5°c[214]. The scaly bulbs are best planted on their sides or surrounded in sand to prevent water collecting in their hollow crowns[238]. This species is cultivated as a medicinal plant in Europe and Asia[163]. Plants take 3 - 5 years to flower from seed.

#### 8.2.280 Salvia carduacea

Thistle Sage

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.7 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia carduacea is a ANNUAL/PERENNIAL growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: DrinkSeed - raw or cooked. It can be roasted, then ground into a powder and used with other seeds as a mush[161, 177, 183, 257]. The seeds can be added to wheat to improve the flavour[257]. It can also be used as a cooling beverage[161, 177, 183].

nrakta South-western N. America - California. ksacta Sandy and gravelly places below 1350 metres[71]. Open grassy places[260].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Plants can be killed by excessive winter wet[200]. This species is not very cold-hardy in Britain, tolerating short periods when temperatures fall to about -3°c[260]. An autumn-germination plant in the wild, it might succeed outdoors in the milder areas of the country but is usually either grown as a spring-sown annual in Britain or grown in an alpine greenhouse[1, 200]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 8.2.281 Gaillardia pinnatifida

Blanket Flower, Red dome blanketflower 7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gaillardia pinnatifida is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: The dried seeds can be ground into a powder then kneaded into seed butter and spread on bread[257].

dwatta Antirheumatic DiureticThe plant is used as a diuretic, taken to give relief from painful urination[216, 257]. An infusion of the leaves is taken internally, and a poultice applied externally, in the treatment of gout[257].

nrakta Southern N. America. ksacta Open grasslands[228].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division, with care[200]. Root cuttlings in the winter[200].

nwatta Requires a position in full sun, succeeding in any moderately fertile well-drained soil[200]. Performs well in poor soils and copes well with hot dry conditions[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Some winter protection, especially in areas experiencing heavy snows, is recommended. Covering the plants with brush wood should be enough[200]. Plants are so prolific and long blooming that they often exhaust themselves and are then short-lived[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

nrakta E. Asia - China to the Himalayas. ksacta Scrub and dry valleys, 1500 - 3000 metres in the Himalayas[184]. Also found in forests in Srinagar[145].

propta Seed - best sown as soon as it is ripe in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy. Cuttings of mature wood in November Layering

nwatta Succeeds in a good well-drained loam in a sunny position[1, 200]. Tolerates light shade[202]. Tolerates most soil types, including dry soils once it is established[202]. This species is not very cold hardy, tolerating temperatures down to about -10°c[184]. It requires some protection such as a warm wall when grown outdoors in Britain[200]. There are some named varieties selected for their ornamental value[188]. The flowers are slightly scented[245]. Plants produce suckers and these can sometimes be invasive[202]. Pruning can be carried out in early to mid spring. Removing one third of the oldest growth down to ground level rejuvenates the plant and encourages greater flowering[202]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.349 Eriodictyon trichocalyx

Hairy Yerba Santa

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 2 m hkuc

htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Eriodictyon trichocalyx is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: TeaThe fresh or dried leaves have been used as a tea[257]. The leaves have been used as a wayside nibble to quench the thirst[257].

tcanta Fire retardant Soil stabilizationPlanted as a firebreak and also for erosion control in California[200].

dwatta Antiasthmatic Antirheumatic Blood purifier FebrifugeThe leaves are blood purifier and febrifuge[257]. A poultice of the freshly pounded leaves has been applied to relieve the pain of rheumatic joints[257]. A decoction of the leaves has been taken internally to treat TB, sore throats, rheumatism, asthma, catarrh, fevers, coudhs and colds[257].

nrakta South-western N. America - California to Mexico. ksacta Drv hills[200].

propta Seed - sow spring in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts

nwatta Requires a position in full sun in a well-drained sandy soil[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -5°c[200]. It is probably best grown against a sunny wall.

#### 8.2.350 Osteomeles subrotunda

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 2 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Osteomeles subrotunda is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in July, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. The fruit is 6 - 12mm in diameter[266]. No more details are given.

nrakta E. Asia - China, Japan. ksacta Hot dry river valleys[200]. Mixed forests, among shrubs at mountain summits, roadsides at elevations of 200 - 500 metres[266].

propta The seed requires a period of cold stratification and can be sown in late autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5-8cm with a heel, July/August in a frame. Pot up in the autumn and overwinter in a greenhouse. Fair to good percentage[78]. Layering.

nwatta Succeeds a sheltered position in full sun in any well-drained soil[166, 182]. Plants usually require protection outside the mildest areas of Britain[11], they are hardy to about -5°c[184]. They can be grown on a sunny wall in colder parts of the country[1]. Plants sold under this name are often O. schwerniae microphylla[219].

drutta Meconopsis napaulensis is a PERENNIAL growing to 2 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in June, and the seeds ripen in August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn edible oil is extracted from the seed[105, 177, 183].

dwatta NarcoticThe root is used as a narcotic[240].

nrakta E. Asia - Himalayas to China, Nepal and Szechwan. ksacta Open slopes and grazed ground, 3000 - 4500 metres[51]

propta Seed - best sown in a cold frame as soon as it is ripe in late summer. Spring sown seed is slower to germinate[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the

nwatta Grows best in a woodland soil in partial shade[1, 201]. The soil should be lime-free, moist, well-drained and moderately rich[200]. Dislikes full sun and windy positions[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. A very ornamental plant[1]. Monocarpic, the plants living for a number of years before flowering but then dying once they flower[200]. A fine plant for growing in open woodland[1]. Plants are subject to 'crown rot' when they are growing in damp conditions[1].

### 8.2.352 Coprosma rhamnoides

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 2 m hkuc

1433

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma rhamnoides is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but with little flavour[225]. The dark red fruit is about 4mm in diameter[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta WoodWood - hard, durable. Used for bridges, shingles  ${\sf etc[46, 61]}$ . When burned, it gives off a delicious  ${\sf aroma[245]}$ .

dwatta Antihalitosis Antiphlogistic Astringent Depurative Sedative StomachicThe leaves and young shoots are antihalitosis, antiphlogistic, astringent, depurative, sedative and stomachic

nrakta New Zealand. ksacta Lowland to montane shrubland, especially on margins, North and South Islands[44].

propta Seed - sow spring in a greenhouse and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold for their first winter or two outdoors. The seed remains viable for many years. Cuttings of half-ripe wood, 5 - 8 cm with a heel, early August in a frame. Over-winter in the greenhouse for its first year and plant out after the last expected frosts. Good percentage[78]. Cuttings of almost mature wood, 4 - 5 cm with a heel, October/November in a frame. Good percentage[78].

nwatta Succeeds in almost any neutral or acid soil of good or reasonable quality, preferring a light sandy loam and full sun[200]. Grows best in an acid sandy soil[260]. Prefers a position sheltered from hot or cold drying winds[200]. This species is not very cold-hardy, tolerating temperatures down to about -5°c, though there are montane forms that might be hardier[260]. It only succeeds outdoors in the milder areas of Britain[200]. Resentful of root disturbance, plants should be pot grown and planted out in their final positions as soon as possible[200]. The flowers have a delicate sweet perfume[245]. Plants do not regenerate from old wood[200]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.346 Heimia salicifolia

Erva De Vida, Shrubby yellowcrest 7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Heimia salicifolia is a deciduous Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: DrinkAn intoxicating and euphoric drink is made by crushing the wilted leaves in water and leaving the liquid in a sunny position for three days to ferment[192]. In larger quantities this can induce hallucinations and produces a vision that is typically overcast in yellow[192].

dwatta Antispasmodic Hallucinogenic SedativeThe leaves are antispasmodic, hallucinogenic and sedative[192]. An infusion serves to stabilize the blood pressure and relieve anxiety[192].

nrakta Southern N. America from Texas to Mexico and south to Central America. ksacta Along the sides of streams [192].

propta Seed - we have no information for this species but suggest sowing the seed in spring in a greenhouse. Prick out the seedlings into individual pots once they are large enough to handle. Grow the young plants on for at least their first winter in a greenhouse and plant out in late spring or early summer. Mulch the roots well in the autumn to protect them from the cold. Cuttings of half-ripe wood, July/August in a frame[2001.

nwatta Easily grown in any well-drained soil in full sun[200]. Especially in the colder areas of the country this plant is best grown against a sunny south or south-west facing wall and given a good mulch of bracken in the winter[200]. The rootstock is fairly hardy in most of Britain, whilst the top growth tolerates temperatures down to about 10 to -15°c[200]. If cut back by severe weather the plant usually grows again from the base[200]. Flowers are produced on the current seasons growth[200]. Plants growing by the side of a greenhouse at Cambridge Botanical Gardens flower freely[11]. This species is closely related to H. myrtifolia,

differing mainly in having larger flowers[11]. Any pruning is best carried out in early spring by removing excess growth at the base of the plant[200].

### 8.2.347 Leptospermum polygalifolium

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 3 m hkuc

htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Leptospermum polygalifolium is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid and neutral soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Edible Uses: TeaThe leaves are a tea substitute[46, 61, 177].

tcanta WoodWood - tough, close grained. Used for poles, stakes, fuel etc[154].

nrakta Australia - Tasmania, Victoria. ksacta Montane area, especially on fairly poor soils[154, 156]. Heaths and dry sclerophyll forests, usually on sandstones and deep sandy soils[265].

propta Seed - sow spring in a greenhouse and only just cover the seed. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold for their first winter or two outdoors. The seed remains viable for many years. Cuttings of half-ripe wood, 5 - 8 cm with a heel, early August in a frame. Over-winter in the greenhouse for its first year. Good percentage[78]. Cuttings of almost mature wood, 4 - 5 cm with a heel, October/November in a frame. Good percentage[78].

nwatta Succeed in almost any neutral or acid soil of good or reasonable quality, preferring a light sandy loam and full sun[200]. Prefers a position sheltered from hot or cold drying winds[200]. Only succeeds outdoors in the mild areas of Britain, tolerating temperatures down to about - 10°c[200]. Grows well in coastal areas so long as it is not too exposed[188]. Resents root disturbance[200]. Plants do not regenerate from old wood[200]. Closely related to L. lanigerum[11]. A good bee plant[108]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.348 Jasminum humile

Yellow Jasmine

1432

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Jasminum humile is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe leaves are used as a condiment[177, 183]. A tea is made from the leaves and bark[183].

tcanta Parasiticide WoodWood - even-grained, moderately hard[146].

dwatta Astringent Cardiotonic Decongestant Parasiticide Stomachic TonicThe flowers are astringent and a tonic for the heart and bowels[240]. A paste made frm the flowers is considered effective in the treatment of intestinal problems[272]. The juice of the root is used in the treatment of ringworm[240, 272]. The milky juice of the plant is used for destroying the unhealthy lining walls of chronic sinuses and fistulas[240].

### 8.2.282 Coprosma acerosa

Sand Coprosma

7 tlin 10 cvuc 2 kcak 0 tcan 0 dwat 0.5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli nyanhjen hjonli

drutta Coprosma acerosa is an evergreen Shrub growing to 0.5 m (1ft 8in) by 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit -raw[177]. Sweet and juicy[173], but with little flavour[225]. The fruit is usually pale blue and up to 8mm long x 6mm wide[200, 225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Coastal sand dunes[44] and elevations up to 1200 metres[11], on North, South and Chatham Islands[225]

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[X]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. An easily grown plant, it succeeds in most soils, so long as they are well-drained[225]. Judging by its habitat this plant should be tolerant of maritime exposure[K]. Somewhat intolerant of frost[200], this species is hardy at Kew but it prefers milder winters[11]. It does not succeed in the colder areas of the country[11]. Fruits are freely produced in Ireland[11]. Does well on a sunny ledge in the rock garden[11, 182]. A widely spreading mat-forming prostrate plant, though it will eventually build up to a height of 60cm[225]. Hybridizes freely with other members of this genus[200, 225], especially C. petriei[225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is required.

#### 8.2.283 Mirabilis jalapa

Marvel Of Peru, Miracle Flower of Peru, Four O'Clock 7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Mirabilis jalapa is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to October, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

pcista The seeds and the roots are reported to cause digestive disturbances[274].

kcakta Edible Parts: LeavesEdible Uses: Colouring CondimentTender young leaves - cooked as a vegetable[105, 183, 272]. An emergency food, only eaten when all else fails[177]. An edible crimson dye is obtained from the flowers[46, 61, 105, 177]. It is used for colouring cakes and jellies[183]. The seed is crushed and used as a pepper substitute[105, 177, 183].

tcanta Cosmetic DyeThe powdered seed is used as a cosmetic[46, 61].

dwatta Diuretic Purgative VulneraryThe root is aphrodisiac, diuretic and purgative. It is used in the treatment of dropsy[46, 61, 154, 218, 240]. A paste of the root is applied as a poultice to treat scabies and muscular swellings[272]. The juice of the root is used in the treatment of diarrhoea, indigestion and fevers[272]. The powdered root, mixed with corn flour (Zea mays) is baked and used in the treatment of menstrual disorders[272]. The leaves are diuretic[272]. They are used to reduce inflammation[240]. A decoction of them is used to treat abscesses[218]. The leaf juice is used to treat wounds[218].

nrakta S. America - Peru. Naturalized in France and possibly other places in Europe. ksacta Not known

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer, after the last expected frosts. The seed remains viable for several years[196]. Division in spring as the plant comes into growth[200].

nwatta Landscape Uses:Border, Container, Specimen. Succeeds in almost any ordinary garden soil[1]. Prefers a fertile well-drained soil in full sun or part day shade[200] This species is not very hardy in Britain. The top growth is cut back by frost but the tuber survives the winter outdoors if the temperature does not fall much below -5°c, a good mulch would be beneficial[200]. Tubers can be lifted and stored over winter in a cool frost free place in the same way that dahlia tubers are stored[1, 200]. The marvel of Peru is usually grown as a half-hardy annual in temperate zones, it flowers freely in its first year[200]. Plants also self-sow freely in warmer areas (these seedlings can be easily transplanted) and they can become a weed in such situations due to their deep rooting habit[200]. This species was cultivated as a medicinal plant by the Aztecs prior to the Spanish congust[274]. The flowers are sweetly scented and do not open until the afternoon[233]. The young growth is particularly susceptible to aphis infestation[200]. Members of this genus are rarely if ever troubled by browsing deer[233]. Special Features: Attracts birds. Not North American native. Naturalizing. Fragrant flowers.

### 8.2.284 Carpobrotus aequilaterus

Sea Fig

1409

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.2 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatprikl-

wishsom hpa7tmwatli xre7t hjonli drutta Carpobrotus aequilaterus is an evergreen Perennial growing to 0.2 m (0ft 8in) by 2 m (6ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils, prefers well-

drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit -

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit raw[257]. They are said to remotely suggest the flavour of strawberry[183]. Leaves - baked[183]. We find them too mucilaginous to be enjoyable[K].

tcanta Fire retardant Soil stabilizationPlanted in maritime areas to prevent soil erosion in sandy soils and on steep banks[200, 265]. The plant is moderately fire-resistant and can be used in barrier plantings to prevent the spread of forest fires[200].

nrakta Southern N. America - California, Mexico. Australia - New South Wales, Tasmania, Victoria. ksacta Naturalised in California where it grows along the coastal strand and in coastal sage scrub at elevations up to 100 metres [276].

propta Seed - surface sow March to June in a greenhouse. Lower night-time temperatures are beneficial. The seed usually germinates in 7 - 10 days at 23°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected

frosts. Cuttings at any time during the growing season. Allow the cutting to dry in the sun for a day or two then pot up in a very sandy mix. Very easy[K].

nwatta Requires a well-drained sandy soil in a sunny position[1, 200]. Plants can be grown on dry walls or in the flower border[166]. Established plants are very drought resistant[200]. Very resistant to wind and salt spray[166]. Moderately fire-retardant[200]. Plants are not very frost resistant, tolerating temperatures down to between -5 and -10°c, and only succeeding outdoors in the milder areas of the country[200]. A vigorous prostrate plant, rooting as it spreads. The flowers only open in the afternoon[200].

### 8.2.285 Gaultheria trichophylla

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.1 m hkuc hmimhtut cyutli tcup hwicli hrasjlut hpa7tli frusflatprik hpa7tmwatli xre7t hionli

drutta Gaultheria trichophylla is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[51, 272]. The blue ovoid fruit is about  $10\ x\ 6mm[200]$ .

tcanta A useful ground cover for shady places.

nrakta E. Asia - W. Himalayas to China. ksacta A creeping shrub in alpine pastures[145], growing on rocks and banks up to elevations of 4500 metres[51]. Montane grasslands, mountain slopes and rocky places[266].

propta The seed requires a period of cold stratification. Pre-chill for 4 - 10 weeks and then surface sow in a limefree compost in a shady part of the greenhouse and keep the compost moist[78]. The seed usually germinates well, usually within 1 - 2 months at 20°c, but the seedlings are liable to damp off. It is important to water them with care and to ensure that they get plenty of ventilation. Watering them with a garlic infusion can also help to prevent damping of Kl. Prick out the seedlings into individual pots when they are about 25mm tall and grow them on in light shade in the greenhouse for at least their first winter[K]. Plant them out in late spring or early summer. The seedlings are susceptible to spring frosts so might need some protection for their first few years outdoors. The leaves remain very small for the first few years[11]. Cuttings of half-ripe wood 3 - 6cm long, July/August in a frame in a shady position. They form roots in late summer or spring[78]. A good percentage usually take. Division in spring when new growth is about 7cm tall. Divided plants can be rather slow to get established[182]. We have found that it is best to pot up the clumps and grow them on in a shady position in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a moist but not boggy humus rich soil in sun or semi-shade[11]. A peat and moisture loving species, it requires a lime-free soil[11]. Prefers a fairly light open position so long as the soil is kept moist[11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This species does not always fruit well in Britain[11]. The plant can make a good nesting place for mice, these mice then eat the bark of the stems in winter causing die-back. The bruised leaves release a hot, aromatic fragrance[245]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.286 Cnicus benedictus

Blessed Thistle

7 tlin 10 cyuc 2 kcak 2 tcan 3 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cnicus benedictus is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to September, and the seeds ripen from July to October. The species is hermaphrodite (has both

male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista May cause allergic reaction if sensitive to the Asteraceae/Compositae family. Possible eye irritation. Excess of 5g per cup of tea may cause stomach irritation and vomiting. Possible cross-reactivity with mugwort and echinacea (also bitter weed, blanket flower, chrysanthemum, colt's foot, dandelion and marigold. Increases stomach acid secretion so caution needed with gastric ulcers and heartburn. Possible increase in bleeding - care needed with anticoagulants or blood thining agents [301].

kcakta Edible Parts: Flowers Leaves Oil RootEdible Uses: Condiment OilYoung leaves - raw[4, 268]. Flower heads, harvested before the flowers open, have been used as a globe artichoke (Cynara cardunculus) substitute[268]. The flower heads are rather small and using them in this way is very fiddly[K]. Root - boiled as a pot herb[268]. The herb is used as a flavouring[105, 183] (the part that is used is not specified).

tcanta OilA good quality oil is obtained from the seed[4, 61]. It has been used in emergencies when other oils were not available[222].

dwatta Appetizer Astringent Bitter Cholagogue Contraceptive Diaphoretic Diuretic Emetic Emmenagogue Galactogogue Homeopathy Stimulant Stomachic Tonic VDThe blessed thistle was widely cultivated in the middle ages, when it was seen as a cure-all for all manner of diseases including the plague[238]. Although less widely used nowadays, it is still seen to have a wide range of applications though it is mainly employed as an ingredient in herbal tonics[268]. The whole plant is astringent, bitter, cholagogue. diaphoretic, diuretic, strongly emetic in large doses, emmenagogue, galactogogue, stimulant, stomachic and tonic[4, 7, 9, 21, 165, 207, 222, 268]. A warm infusion of the plant is said to be one of the most effective means of improving the milk supply of a nursing mother[4]. An infusion of the whole plant has also been used as a contraceptive [213] and is often used in the treatment of liver and gall bladder problems[9]. The plant is also used internally in the treatment of anorexia, poor appetite associated with depression, dyspepsia, flatulent colic etc[238]. The whole plant was infused overnight in cold water and the liquid drunk three times daily in the treatment of VD. Men were required to run after each dose in order to encourage sweating. The treatment often caused nausea and vomiting[213] - excessive doses of the plant cause vomiting[7]. The plant is used externally in the treatment of wounds and ulcers[238]. The plant is harvested in the summer as it comes into flower and is dried for later use[4]. A homeopathic remedy is made from the plant[9]. It is used in the treatment of the liver and gall bladder[9]. The German Commission E Monographs, a therapeutic guide to herbal medicine, approve Cnicus benedictus for dyspepsia (indigestion) and loss of appetite (see [302] for critics of commission

nrakta S. Europe to W. Asia. An infrequent casual in Britain[17]. ksacta Dry sunny places in arable, stony and waste ground[7, 9, 165].

propta Seed - sow in situ in the spring or early autumn[111]. The seed usually germinates in 2 - 6 weeks at 10°c[164].

nwatta Easily grown in ordinary garden soil[1]. Prefers a dry soil and a sunny position[7]. Grows best in a well manured soil[268]. A very ornamental plant, it is often cultivated in Europe as a medicinal herb and for its oil yielding seed[9,61]

### 8.2.287 Brassica tournefortii

Wild Turnip-Rape, Asian mustard

1410

7 tlin 11 cyuc 2 kcak 1 tcan 0 dwat 0.6 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Brassica tournefortii is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 7. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic

germination. Stored seed should be soaked overnight and then stratified for 1- 2 weeks at  $3^{\circ} c [134]$ . The seed usually germinates in 1- 3 months or more at  $20^{\circ} c [134]$ . When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Once they are  $20 \, \mathrm{cm}$  or more tall, plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of mature wood of the current season's growth, 15-  $20 \, \mathrm{cm}$  long outdoors at any time between September to February though October and November are best[78]. Very easy, even small branches will root[1]. Layering in autumn. Takes 12 months[78].

nwatta Landscape Uses: Border, Container, Foundation, Massing, Specimen, Woodland garden, A very tolerant and easily grown plant[1], it thrives in most soils and even in the total shade of trees[11, 182, 200] though for good fruit production a position with at least moderate sun should be chosen[11]. Tolerates dry soils and drought[184, 200]. Grows well in heavy clay soils. Tolerates salt winds[200] Very tolerant of atmospheric pollution[11]. Plants are hardy to about -15°c[184, 200]. Often grown in the ornamental garden, there are many named varieties[182]. The foliage can be scorched in very long hot summers if the plant is in an open position[200]. Very tolerant of pruning, plants can be cut right back into the old wood if required[184, 200]. Plants in this genus are notably resistant to honey fungus[200]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

### 8.2.343 Nicotiana glauca

Tree Tobacco

7 tlin 10 cyuc 1 kcak 3 tcan 2 dwat 3 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Nicotiana glauca is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from August to October, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant are poisonous[200].

kcakta The leaves have been made into a drink[257]. Some care should be exercised here. The tea will contain nicotine, and this can be toxic to the body. There is some evidence that Nicotiana glauca may have led to accidental poisoning when it was mistaken for other plants. We would recommend that ingestion is not considered. Please see the warning in Known Hazards.

tcanta InsecticideAll parts of the plant contain nicotine, this has been extracted and used as an insecticide[46, 61]. Dynamic accumulator.

dwatta Antirheumatic Poultice SkinA poultice of the leaves can be applied to cuts, bruises, swellings and other wounds[257]. The plant has been used as a poultice for removing the pus from scrofulous sores or boils[257]. A poultice of the leaves has been applied to inflamed throat glands[257]. An infusion of the leaves has been used as a steam bath in the treatment of theumatism[257]

nrakta S. America - S. Bolivia to N. Argentina. Naturalized in the Mediterranean. ksacta Rocks, walls and roadsides in the Mediterranean[50].

propta Seed - surface sow in a warm greenhouse about 10 weeks before the last expected spring frosts. The seed usually germinates in 10 - 20 days at  $20^{\circ}\mathrm{c}$ . Keep the soil moist and pot up as soon as the plants are big enough to handle, planting them out after the last expected frosts.

nwatta Industrial Crop: Pesticide Regional CropPrefers a well-drained deep rich moist soil in a sunny position[1, 200]. This species is hardy to about -5°c[200]. Plants can survive the winter outdoors in the milder parts of Britain, though they usually act as herbaceous perennials in such conditions[200]. Plants require more than 14 hours daylight per day in order to induce flowering[169].

#### 8.2.344 Buddleia asiatica

Bai Bei Feng

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Buddleia asiatica is an evergreen Shrub growing to 3 m (9ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to April. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

kcakta Edible Parts: Edible Uses: DrinkThe dried and powdered root is used in the preparation of a fermented liquor[183].

tcanta WoodWood - tough, moderately hard. It could be used for making walking sticks[158].

dwatta Abortifacient SkinThe plant has been used as an abortifacient and also in the treatment of skin complaints[240, 243]. The juice f the plant is applied as a wash to treat skin diseases[272].

nrakta E. Asia - India to the Philippines. ksacta Second growth forest, sandy river banks, grass, savannah, landslips and deserted village sites[146, 260].

propta Seed - cold stratify for 4 weeks at 4°c[138] and surface sow the seed in February/March in a greenhouse[78, 113] (the pre-chilling might not be required for this species). Germination usually takes place within 3 - 4 weeks at 21°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early sumer, after the last expected frosts. Seedlings are inclined to damp off and so should be watered with care and kept well-ventilated[78]. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Use short side-shoots[78]. Very high percentage[113]. Cuttings of mature wood of the current season's growth, 15 - 20cm long, October/November in a frame[2001]

nwatta Requires a sunny position, succeeding in most reasonably good soils so long as they are well-drained[1, 11. 182, 2001. Prefers a rich loamy soil[11]. Plants are very tolerant of alkaline soils[200]. Of doubtful hardiness in most of Britain, it is likely to be damaged or killed by temperatures lower than 0°c[260]. However, one report says that it succeeds outdoors in southern Cornwall[1] whilst other reports say that it might be hardy on a south or south-west facing wall in the mildest areas of this country[11, 166, 182, 188] So long as the plant is well mulched it resprouts freely from the base if cut back by severe weather[200]. A very ornamental plant[1], the cut flowers last well in water[200]. Hybridizes freely with other members of this genus[200]. Any pruning is best done after flowering[200]. An excellent plant for bees and butterflies Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.345 Leptospermum ericoides

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hionli

drutta Leptospermum ericoides is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: Edible Uses: TeaA refreshing tea can be made from the young shoot tips[173, 183].

pcista There is a report that the fresh plant contains the toxin hydrogen cyanide [243]. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death.

kcakta Edible Parts: Edible Uses: TeaThe leaves are used as a tea substitute[177, 183]. Some caution is advised, see the notes above on toxicity.

nrakta E. Asia - China to the Himalayas. ksacta Scrub and forest in the mountains, 1200 - 2700 metres from Uttar Pradesh to S.W. China and Burma[51, 184]. Dense forests or thickets in valleys or on mountain slopes[266].

propta Seed - surface sow in a greenhouse in spring[113]. Cover the pot with paper until the seed germinates[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 8cm long, July/August in a frame. Overwinter in a greenhouse and plant out in late spring[78]. Cuttings of mature wood in late autumn in a frame[200]. Mound layering in spring. Takes 12 months[78]. Leaf-bud cuttings of the current seasons growth in a frame[200].

nwatta Landscape Uses:Specimen. Succeeds in most good soils, including chalk[184]. This species is one of the most chalk-tolerant members of the genus[200]. Tolerates most soils[200], thriving in a well-drained loamy soil[1], but resenting dryness at the roots[11, 200]. Succeeds in full sun or semi-shade[200], but if it is grown in a low rainfall area then it requires shade at the hottest part of the day[11]. Does well on very acid soils with a pH around 4.5[200]. The colour of the flowers reflects the pH of the soil the plant is growing in, the flowers are pink in a neutral to alkaline soil and blue in an acid soil. Grows well in an open woodland garden[200]. Although fairly tolerant of soil type, this species is not very easy to grow well, it is best given a dryish soil, it resents winter wet[11]. Dormant plants are hardy to about -15°c[184]. They are somewhat tender when young, and the young growth of older plants is also susceptible to damage by late frosts[11]. Plants resent being pruned[202]. This species is notably susceptible to honey fungus[200]. Special Features: Suitable for cut flowers, Suitable for dried flowers, Blooms are very showy.

### 8.2.341 Ilex cornuta

Horned Holly, Chinese holly 7 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta llex cornuta is an evergreen Shrub growing to 4 m (13ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower in April, and the seeds ripen from October to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

kcakta Edible Parts: FruitEdible Uses: The fruit is thinskinned with a sweet taste[178]. Is this report suggesting that it is edible?[K].The fruit is about 8 - 10mm in diameter[200].

dwatta Abortifacient Carminative Contraceptive Febrifuge TonicThe whole plant is abortifacient, carminative, contraceptive, febrifuge and tonic[147, 178]. It particularly strengthens the back and knees[147]. The leaf is made into a tea which is said to be contraceptive if used by women and is also used for termination pregnancies[218]. The stem bark is tonic[218]. The whole plant is used in the treatment of

arthritis, recurring fever in pulmonary tuberculosis, tubercular lymph nodes, joint pained and lumbago[147, 218].

nrakta E. Asia - E. China, Korea. ksacta Ravines and hills, 150 - 600 metres[184]. Wild places and alongside mountain paths in full sunshine[147].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Landscape Uses:Border, Espalier, Pest tolerant, Screen, Standard, Specimen, Street tree. Succeeds in most soils that are not water-logged[200]. Plants are hardy to about -15°c[184]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. A number of named forms have been developed for their ornamental value[182]. Dioecious. Male and female plants must be grown if seed is required. Special Features:Not North American native, Inconspicuous flowers or blooms

### 8.2.342 Aucuba japonica

Spotted Laurel, Japanese laurel, Japanese Gold Dust Tree 7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 3 m hkuc

pcimhmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyikfrip hpa7tli frusflatpriklwisslip hpa7tmwatli nyanhien hionli

drutta Aucuba japonica is an evergreen Shrub growing to 3 m (9ft) by 2.5 m (8ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from March to April, and the seeds ripen from October to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

kcakta Edible Parts: LeavesEdible Uses: Leaves - cooked. An emergency food[177]. It would have to be quite an emergency to convince me to eat them[K].

tcanta Hedge HedgeMakes a good hedge but its large leaves mean that it is quite labour intensive to maintain if a neatly clipped appearance is desired[29]. Unless you are happy with the large leaves being cut in half, it means that you have to trim the hedge with secateurs[29]. The plant will eventually make large weed-excluding shrubs and are suitable for covering large areas of ground, there are some dwarf forms that can be grown for ground cover[208]. 'Nana Rotundifolia' has been mentioned and will form a hummock of growth about 1 metre across[208].

dwatta PoulticeThe leaves are pounded and applied to burns, swellings, chilblains etc[218].

nrakta E. Asia - China, Japan. ksacta Woods in lowland and mountains all over Japan[58]. In rich forest soils of moist valleys, dense forests, thickets, by streams and near shaded moist rocks in China[266].

propta Seed - best sown as soon as it is ripe in a cold frame[134]. Wash off the pulpy coating since this can inhibit

(mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Leaves OilEdible Uses: OilLeaves and young shoots - cooked[177, 183]. An edible oil is obtained from the seed[177, 183].

nrakta Europe - E. Mediterranean to W. Asia. ksacta Dunes, roadsides and fields in the maritime belt[74].

propta Seed - sow spring in situ.

nwatta We have very little information on this species and do not know if it will be hardy in Britain, though it should be possible to grow it as a spring-sown annual. The following notes are based on the general needs of the genus. Succeeds in full sun in a well-drained fertile preferably alkaline soil[200]. Grows well in the heavier soils.

#### 8.2.288 Geranium tuberosum

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Geranium tuberosum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf from October to July, in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Edible tubers[177]. Up to 15mm wide[200].

nrakta Europe - Mediterranean. ksacta Cultivated ground, fields, vineyards and meadows[89].

propta Seed - sow spring in a cold frame or as soon as it is ripe in the summer. Division in late summer or early autumn. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Succeeds in any moderately fertile retentive soil in a sunny position[200]. Tolerates a wide range of soil types[200]. Established plants are drought resistant[190]. This species is not hardy in all parts of Britain, it tolerates temperatures down to between -5 and -10°c[200]. Plants come into growth in the autumn and die down in midsummer[190]. Plants spread by means of underground tubers and can be invasive[190]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. At least one named variety has been selected for its ornamental value[200]. 'Charlesii' has a low spreading habit[200].

#### 8.2.289 Tulbaghia alliacea

Society Garlic

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Tulbaghia alliacea is a CORM growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK cone 8. It is in flower from June to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves RootEdible Uses: Bulb - cooked[183]. Leaves and stems - they can be cooked like spinach or chopped fine and used as a relish[183]. Flowers. They are regarded as a delicacy by the native Zulu women[183].

nrakta S. Africa - Cape province. ksacta Sandy flats[245]. Clay or gravelly flats[282].

propta Seed - best sown as soon as it is ripe in the greenhouse[200]. Sow stored seed in early spring in the greenhouse[200]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in the greenhouse for at least their first winter. If planting them outdoors, this is best done in late summer when the plants are dormant. Division of the dormant plants in late summer.

nwatta Requires a well-drained soil in a sunny sheltered position[200]. This species is hardy in the mildest areas of

Britain, tolerating temperatures down to about -5°c[200]. However, it is in leaf during the winter and so is best grown with some protection such as a cold greenhouse or conservatory[200]. Plants grow from a cluster of small bulbs attached to a basal plate that is sometimes regarded as a rhizome[200]. The flowers are very fragrant at night[200]. Another report says that they have an unpleasant smell[245]. The whole plant has a powerful aroma of garlic[200, 245].

### 8.2.290 Atriplex truncata

Wedgescale Saltbush

7 tlin 10 cvuc 2 kcak 4 tcan 0 dwat 0.9 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwissliphsom hpa7tmwatli hjonli

drutta Atriplex truncata is a ANNUAL growing to 0.9 m (3ft) by 0.9 m (3ft in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September, and the seeds ripen from August to October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista No member of this genus contains any toxins, all have more or less edible leaves. However, if grown with artificial fertilizers, they may concentrate harmful amounts of nitrates in their leaves.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves and young plants - cooked. A salty flavour. Seed -cooked[161, 177, 257]. Used in piñole or ground into a meal and used as a thickener in making bread or mixed with flour in making bread.

tcanta FodderA good fodder crop.

nrakta Western N. America - southern British Columbia to California. ksacta Saline saltgrass-greasewoodrabbitbrush communities, and other pans or palustrine or lacustrine habitats at elevations of 400 - 2700 metres[270].

propta Seed - sow April/May in situ[134]. Germination is usually rapid.

nwatta Fodder: Bank Management: Coppice Management: Fodder Regional CropWe have very little information on this species and do not know if it will be hardy in Britain, though it should be possible to grow it as a spring-sown annual. The following notes are based on the general needs of the genus. Succeeds in full sun in any well-drained but not too fertile soil[200]. Most species in this genus tolerate saline and very alkaline soils[200].

#### 8.2.291 Abronia latifolia

Sand Verbena, Coastal sand verbena 7 tlin 10 cyuc 2 keak 0 tcan 0 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Abronia latifolia is a PERENNIAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: RootEdible Uses: Root - large and sweet[46, 61, 118]. An emergency food, used when all else fails[177]. Long and stout[183], it can be more than 60cm in length[2]. The root was usually harvested in the autumn[257].

nrakta South-western N. America - California to Vancouver Island. ksacta Coastal sand dunes and sea beaches[60]. Sandy soils, coastal scrub, lees of dunes adjacent to strand from sea level to 50 metres[270]

propta Seed - sow autumn or early spring very shallowly in pots of sandy soil in a greenhouse[133]. Germination can be very slow unless you peel off the outer skin and pre-soak the seed for 24 hours in warm water[200, 245]. The seed usually germinates in 1 - 2 months at  $15^{\circ}$ (133]. When large

enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Seedlings are prone to damp off and so should be kept wellventilated[200]. Plant out in late spring, after the last expected frosts. Cuttings in spring, rooted in sand[200].

nwatta Prefers a light well-drained sandy soil in full sun[200]. This species is not very hardy in Britain, though it should succeed outdoors in the southern part of the country, especially if given a warm sheltered site[200]. Seed is rarely ripened on plants growing in Britain[1].

### 8.2.292 Ophiopogon japonicus

Snake's Beard, Dwarf lilyturf, Mondo Grass, Monkey Grass,

7 tlin 11 cvuc 2 kcak 0 tcan 3 dwat 0.3 m hkuc

hmimhtut cyutli tcuphja7nhs6s hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ophiopogon japonicus is an evergreen Perennial growing to 0.3 m (1ft) by 1 m (3ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil and can grow in water.

kcakta Edible Parts: RootEdible Uses: Root[61]. A bitterness should be removed according to some reports[105, 177] whilst another says that it is sweet and aromatic[178]. Mucilaginous[179, 218]. The root contains about 1.6% protein, 0.5% fat, 80% carbohydrate, 2.3% ash[179].

tcanta Soil stabilizationA good carpeting plant[1, 200] that spreads quite freely[208], it is commonly planted as a ground cover or as a low-maintenance grass substitute[187, 208]. It is particularly valuable for preventing soil erosion[200]. Plants should be spaced about 45cm apart each wav[208]

dwatta Antipyretic Antiscrophulatic Antitussive Aphrodisiac Cancer Emollient Expectorant Nutritive Pectoral Sedative Sialagogue Stomachic TonicThe root is antitussive, aphrodisiac, expectorant, pectoral, sedative, sialogogue, stomachic and tonic[147, 174, 176, 218, 238]. It is said to have anticancer activity[218]. It is used internally in the treatment of dry coughs, fevers, thirst, dry constipation, insomnia, anxiety and palpitations[238]. It is also frequently used in polyherbal treatments of diabetes mellitus[218]. The roots have an antibacterial action, inhibiting the growth of Staphylococcus, E. coli, Bacillus subtilis, B. typhi etc[176]. The roots are harvested in the spring and dried for later use[238]. The plant is antipyretic, antiscrofulatic, antitussive, emollient, expectorant and tonic[218]. Lowers blood pressure[176]. Nodules on the fibrous roots are used as a nutritive tonic in the treatment of TB[174].

nrakta E. Asia - China, Japan, Korea. ksacta Damp ground[174] in shady places in lowland and foothills[58]. Forests, dense scrub in ravines, moist and shady places on slopes and along streams, cliffs at elevations of 200 - 2800 m in China[266].

propta Seed - best sown as soon as it is ripe in a sandy compost in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring[188].

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Rock garden, Seashore, Specimen, Woodland garden. Prefers a sandy soil[1]. Succeeds in any moderately fertile well-drained soil and also as a submerged aquatic plant, though it does not flower in such a situation[200]. Succeeds in a sunny position if the soil remains moist all year round, otherwise it should be grown in semi-shade[200]. Plants may require winter protection according to one report[1], whilst another says that they are hardy to about -20°c[200]. Plants only succeed outdoors in the milder areas of the country[208]. This species is cultivated as a medicinal plant in China[178]. Special Features:Not North American native, Invasive, Naturalizing, Inconspicuous flowers or blooms.

### 8.2.293 Asclepias eriocarpa

Woollypod Milkweed

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.9 m hkuc hmimhtut cyutli kyuctcup hwicli hyishras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asclepias eriocarpa is a PERENNIAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, insects, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist

pcista Although no specific reports have been seen for this species, many, if not all, members of this genus contain toxic resinoids, alkaloids and cardiac glycosides[274]. They are usually avoided by grazing animals[274]. The plant is said to be poisonous to sheep[1].

kcakta Edible Parts: Edible Uses: GumA gum obtained from the latex in the stems can be used for chewing[46, 61, 92. 161. 1771. It is usually boiled in water first until it coagulates and is sometimes mixed with oil[257].

tcanta Fibre Gum LatexA fibre from the stems is used for ropes, clothing etc[46, 61, 92, 95, 257]. The fresh stems are soaked in water or the dried and decaying stems basted with boiling water, in order to remove the fibre [257]. Rubber can be made from latex in the stems and leaves[46, 61, 92, 161, 177]. The leaves contain up to 2.4% latex[112].

dwatta Antiasthmatic Skin Sternutatory WartsA decoction of the plant, and a salve made from it, is used in the treatment of colds[257]. The milky sap is applied on a regular basis to corns in order to gradually remove them[257]. It is also applied to cuts, sores and warts[257]. The powdered dried roots are inhaled to cause sneezing[257]. Smoke from the burning dried plant is inhaled as a treatment for asthma[257]

nrakta South-western N. America - California ksacta Dry barren places below 2000 metres[71].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn or in late winter[134, 169]. We have also had good results from sowing the seed in the greenhouse in early spring[K], though stored seed might need 2 - 3 weeks cold stratification[134]. Germination usually takes place in 1 - 3 months at 18°c[134]. As soon as the seedlings are large enough to handle, prick them out into individual pots and grow them on in the greenhouse for their first winter. Plant out when they are in active growth in late spring or early summer and give them some protection from slugs until they are growing away strongly. Division in spring. With great care since the plant resents root disturbance. Pot the divisions up and place them in a lightly shaded position in the greenhouse until they are growing away strongly, then plant them out in the summer, giving them some protection from slugs until they are established.. Basal cuttings in late spring. Use shoots about 10cm long with as much of their white underground stem as possible. Pot them up individually and place them in a lightly shaded position in a greenhouse until they are rooting and growing actively. If the plants grow sufficiently, they can be put into their permanent positions in the summer, otherwise keep them in the greenhouse until the following spring and when they are in active growth plant them out into their permanent positions. Give them some protection from slugs until they are established.

nwatta Prefers a well-drained light rich or peaty soil in full sun[1, 200]. Succeeds in poor soils. This species is not very hardy in Britain, the plants may need root protection in severe winters[1] but if this is applied as a mulch then it should be removed before new growth begins in the spring because plants are particularly at risk from slugs[K]. Many members of this genus seem to be particularly prone to damage by slugs. The young growth in spring is especially vulnerable, but older growth is also attacked and even well-established plants have been destroyed in wet years[K]. Plants resent root disturbance and are best planted into their final positions whilst small[134]. The flower of many members of this genus can trap insects between its anther cells, the struggles of the insect in escaping ensure the pollination of the plant[207].

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or 8.2.339 Pyracantha koidzumii cooked[158, 177, 272]. The fruit is up to 12mm in diameter[200].

tcanta Fibre ParasiticideA strong fibre is obtained from the stem bark[272]. It is used for making twine and rope[146, 158]. Wood is used mainly for fuel[272].

dwatta ParasiticideThe juice of the leaves is applied to areas of the skin affected by scabies[272].

nrakta E. Asia - China to the Himalayas. ksacta Mainly found on old cultivated land to 2100 metres in the Himalayas[146]. Along the banks of streams at elevations of 500 - 2200 metres in Nepal[272].

propta Seed - sow late winter to mid-summer in a greenhouse and only just cover the seed. Germination usually takes place within 1 - 2 months at 20°c[175]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Softwood cuttings in early summer[1].

nwatta Prefers a fertile well-drained loam with some shelter at the hottest part of the day[200]. Plants tolerate occasional lows to about -5°c[260]. This species is probably not. very hardy in Britain and will probably require greenhouse protection, though it might be possible to grow it outdoors in the mildest areas of the country, especially if it is given the protection of a warm wall. A very variable species[266]. Dioecious, male and female plants must be grown if seed and fruit is required.

### 8.2.338 Baccharis viminea

Mule's Fat

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 4 m hkuc

htut cyutli kyuctcup hwicli hyishrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Baccharis viminea is an evergreen Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young shoots cooked[257]. Roasted and eaten as a famine food when little else is available[257].

tcanta Hair Soil stabilizationAn effective ground-cover plant for sunny banks[200]. The plant has an extensive root system and is very useful for stabilizing sand dunes etc[200]. The leaves have been used as a tonic wash for the scalp and hair to prevent baldness[257]. A charcoal made from the stems has been used to make gunpowder[257].

dwatta Ophthalmic Skin StingsA decoction of the leaves and stems has been used as a female hygienic agent[257]. An infusion of the leaves has been used as an eyewash and has also been applied to bruises, wounds or insect stings[257].

nrakta South-western N. America - California to Mexico. ksacta Dry stream beds, ditch banks etc, usually below 450 metres[71].

propta Seed - no pre-treatment is required[113]. Surface sow in pots a cold frame in the spring, do not let the compost dry out. Germination usually takes place within 1 -2 weeks[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood. July/August in a frame. Very easy[K]. Cuttings of mature wood of the current seasons growth, November in a frame. Easy[K].

nwatta Succeeds in almost any soil, from heavy clays to pure sands, if it is growing in a sunny position[11, 200]. Very tolerant of poor dry soils[200]. This species is not hardy in the colder areas of the country, it requires an almost frostfree climate and tolerates temperatures down to between -5 and -10°c[200]. Plants respond well to trimming[200]. Dioecious. Male and female plants must be grown if seed is required.

Formosa firethorn

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Pyracantha koidzumii is an evergreen Shrub growing to 4 m (13ft 1in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to July, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, it belongs to a genus where most, if not all members of the genus produce hydrogen cyanide, a poison that gives almonds their characteristic flavour. This toxin is found mainly in the leaves and seed and is readily detected by its bitter taste. It is usually present in too small a quantity to do any harm but any very bitter seed or fruit should not be eaten. In small quantities, hydrogen cyanide has been shown to stimulate respiration and improve digestion, it is also claimed to be of benefit in the treatment of cancer. In excess, however, it can cause respiratory failure and even death

kcakta Edible Parts: FruitEdible Uses: Fruit[177]. No more details are given. The fruit is about 7mm in diameter[2001

nrakta E. Asia - Taiwan. ksacta Rocky valley areas. seashores, thickets, among shrubs[266].

propta Seed - best sown as soon as it is ripe in a cold frame[200]. Remove all the fruit flesh since this can inhibit germination[200]. Stored seed requires 3 months cold stratification, sow it as early in the year as possible in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of almost mature wood, 5 -10cm with a heel, mid-August in a cold frame[78]. Pot up in October or the following spring[78].

nwatta Prefers a good well-drained, moisture retentive loamy soil[1, 200]. Succeeds in any soil that is warm and not very heavy[11]. Another report says that it grows well in heavy clay soils. Succeeds in sun or part shade, though it does not fruit so well in a shady position[200]. Tolerates atmospheric pollution and reasonable exposure, though it requires protection from cold winds[200]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. It succeeds outdoors at Kew[11]. Plants are susceptible to scab and fireblight[11]. especially when they are grown on acid sandy soils[182]. Closely related to P. rogersiana[11]. There are a number of named forms selected for their ornamental value[200]. 'Santa Cruz', 'Rosedale' and 'Victory' all have fruits larger than the type species[200].

### 8.2.340 Hydrangea aspera

7 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 4 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli frusflatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Hydrangea aspera is a deciduous Shrub growing to 4 m (13ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in flower from July to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid and very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

nrakta S. Europe to W. Asia. ksacta Hedges, roadsides and thickets, in maquis and garigue on dry sandy hills to 3000 metres[89].

propta Seed - best sown as soon as it is ripe in a cold frame and moved into the greenhouse in February. Fair to good germination[78]. Prick out the seedlings into individual pots when they are large enough to handle and overwinter them in the greenhouse for their first year. Plant them out in early summer. Cuttings of half-ripe wood, July/August in a frame[200]. Root cuttings 4cm long, December in a greenhouse. Fair to good percentage[78]. Layering

nwatta Succeeds in an ordinary well-drained garden soil in full sun[182, 200]. Tolerates light shade[202]. Prefers a limy soil[200]. Grows well in dry soils and, once established, is drought tolerant[184]. Prefers a light sandy soil in a warm sunny position[245]. Hardy to about -15°c[184]. Plants are of slow to moderate growth[202]. The branches are pliable and excessively spiny[11]. Plants can regrow from the base if they are cut back by severe weather[200]. The flowers are slightly perfumed[245]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.335 Nannorrhops ritchiana

Mazari Palm

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Nannorrhops ritchiana is an evergreen Tree growing to 5 m (16ft) by 3 m (9ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Flowers Fruit LeavesEdible Uses: Young leafs and buds[2]. No more details are given. Young inflorescence[2].No more details are given. Fruit[2]. No more details are given.

dwatta Dysentery PurgativeThe leaves are purgative[240]. They are used in the treatment of diarrhoea and dysentery[240]. Yes, both these reports come from the same source, without further explanation[K]. The plant is chiefly used in veterinary medicine[240].

nrakta W. Asía - Iran to Afghanistan and Pakistan. ksacta Open, sparsely vegetated semi-arid desert regions where there is a water table close enough to the surface to provide a continuous supply of moisture[231].

propta Seed - best sown as soon as it is ripe in a warm greenhouse at not less than 24°c[188]. Stored seed is very slow to germinate. Pre-soaking the seed for 24 hours in warm water prior to sowing may shorten the germination time. Plants form a long tap-root some time before forming a shoot and so should be sown in fairly deep pots. Germination of fresh seed usually takes place in 3 - 4 months at 25°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts.

nwatta Little is known about this species cultural requirements, but it probably succeeds in most fertile moist but well-drained soils in a sheltered sunny position[231]. Plants experience very cold winters in their native habitat, though this is accompanied by heavy snow which acts to insulate the plant from the extremes of cold. However, this species should be suitable for cultivation in temperate areas that only experience light frosts[231]. Palms usually have deep penetrating root systems and generally establish best when planted out at a young stage. However, older plants are substantially more cold tolerant than juvenile plants[231]. In areas at the limit of their cold tolerance, therefore, it is prudent to grow the plants in containers for some years, giving them winter protection, and only planting them into their permanent positions when sheer size dictates[231]. Palms can also often be transplanted even when very large. Although the thick fleshy roots are easily damaged and/or desiccated, new

roots are generally freely produced. It is important to stake the plant very firmly to prevent rock, and also to give it plenty of water until re-established - removing many of the leaves can also help[231].

#### 8.2.336 Ligustrum japonicum

Japanese Privet, Japanese Ligustrum, Waxleaf Ligustrum, Texas Privet, Waxleaf Privet

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ligustrum japonicum is an evergreen Shrub growing to 5 m (16ft) by 6 m (19ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no reports of toxicity have been seen for this species, at least one member of this genus is recorded as being mildly toxic and it is quite possible that other members of the genus also contain toxins[65].

kcakta Edible Parts: LeavesEdible Uses: CoffeeThe roasted seed is a coffee substitute[61, 177]. Young shoots - cooked. A famine food, used when all else fails[179]. The shoots contain a glycoside and are probably toxic[K].

tcanta Hedge Hedge WaxA commercial insect wax is produced on the branches as a result of eggs being laid by insects[11]. Another report says that the wax is produced by the plant due to the stimulation of the feeding insects[61, 149]. Yet another report says that the wax is produced by the insects[178]. It is used for candles and as a polish for earthenware pots, book edges etc[178]. The plant can be used as a hedge[11]. It is very amenable to trimming.

dwatta Antibacterial Hypotensive TonicThe fruit is said to be a nutrient tonic[218]. Extracts of the plant show antibacterial, antiulcer and hypotensive activity[218].

nrakta E. Asia - China, Japan, Korea. ksacta Woods and thickets in lowland and hills, C. and S. Japan[58].

propta The seed does not require any pre-treatment and can be sown in the spring in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 10cm with a heel, July/August in a frame. Very easy[78]. Cuttings of mature wood, 20 - 30cm in a sheltered outdoor bed in November/December. High percentage[78].

nwatta Landscape Uses:Border, Container, Pest tolerant, Rock garden, Screen, Standard, Seashore, Specimen. A very tolerant and easily grown plant, it succeeds in any soil that is not impoverished or water-logged[11, 182]. Grows well in heavy clay soils. Succeeds in sun or semi-shade[188]. Closely related to L. lucidum[11, 200]. There are many named varieties selected for their ornamental value[200]. This species is notably resistant to honey fungus[200]. Special Features:Attractive foliage, Not North American native, Naturalizing, Attractive flowers or blooms.

#### 8.2.337 Debregeasia longifolia

Wild Rhe

1428

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Debregeasia longifolia is an evergreen Shrub growing to 5 m (16ft 5in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from July to September, and the seeds ripen from October to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

### 8.2.294 Amaranthus palmeri

Careless Weed

7 tlin 12 cyuc 2 kcak 1 tcan 0 dwat 0.9 m hkuc htut cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Amaranthus palmeri is a ANNUAL growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil and can tolerate drought.

pcista No members of this genus are known to be poisonous, but when grown on nitrogen-rich soils they are known to concentrate nitrates in the leaves. This is especially noticeable on land where chemical fertilizers are used. Nitrates are implicated in stomach cancers, blue babies and some other health problems. It is inadvisable, therefore, to eat this plant if it is grown inorqanically.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves cooked as a spinach[46, 85, 95, 105, 161]. The leaves can also be dried for winter use[257]. Seed - cooked[46, 85, 95, 105, 161]. Very small but easy to harvest and very nutritious. It is usually ground into a powder and then used with cereal flours in making porridge, bread etc[257]. The seed can be cooked whole, and becomes very gelatinous like this, but it is rather difficult to crush all of the small seeds in the mouth and thus some of the seed will pass right through the digestive system without being assimilated[K].

tcanta DyeYellow and green dyes can be obtained from the whole plant[168].

nrakta South-western N. America ksacta Waste places and fields at low elevations, also in interior valleys and deserts in California[71].

propta Seed - sow late spring in situ. An earlier sowing can be made in a greenhouse and the plants put out after the last expected frosts. Germination is usually rapid and good if the soil is warm[133]. A drop in temperature overnight aids germination[133]. Cuttings of growing plants root easily[206].

nwatta We have very little information on this species and do not know how well it will grow in Britain, though it should succeed as a spring-sown annual. The following notes are based on the general needs of the genus. Prefers a well-drained fertile soil in a sunny position[200]. Requires a hot sheltered position if it is to do well[K]. Plants should not be given inorganic fertilizers, see notes above on toxicity. Most if not all members of this genus photosynthesis: by a more efficient method than most plants. Called the 'C4 carbon-fixation pathway', this process is particularly efficient at high temperatures, in bright sunlight and under dry conditions[196].

#### 8.2.295 Centella asiatica

Gotu Kola, Spadeleaf

7 tlin 10 cyuc 2 kcak 0 tcan 5 dwat 0.2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Centella asiatica is an evergreen Perennial growing to 0.2 m (0ft 8in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is polinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

pcista There is a warning that the plant can irritate the skin[238], though it is widely used to treat skin complaints[238].

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked. Used in salads and in curries[238]. Cooked as a vegetable[272]. An aromatic flavour, we have found them to

be rather overpowering in salads when used in any but small quantities[K].

tcanta CosmeticExtracts of the plant are added to cosmetic masks and creams to increase collagen and firm the skin[238]

dwatta Adaptogen Anticonvulsant Antidiarrhoeal Antiinflammatory Antipanic Antirheumatic Cardiac Depurative Diuretic Febrifuge Hypotensive Leprosy Malaria Nervine Sedative Skin TonicGotu kola is an outstandingly important medicinal herb that is widely used in the Orient[238] and is becoming increasingly popular in the West[254]. Its Indian name is 'Brahmi' which means 'bringing knowledge of the Supreme Reality' and it has long been used there medicinally and as an aid to meditation[238]. It is a useful tonic and cleansing herb for skin problems and digestive disorders[254]. In India it is chiefly valued as a revitalizing herb that strengthens nervous function and memory[254]. The whole plant is alterative, cardio-depressant, hypotensive, weakly sedative and tonic[240]. It is a rejuvenating diuretic herb that clears toxins, reduces inflammations and fevers, improves healing and immunity, improves the memory and has a balancing effect on the nervous system[147, 152, 238, 240]. It has been suggested that regular use of the herb can rejuvenate the neryous system and it therefore deserves attention as a possible cure for a wide range of nervous disorders including multiple sclerosis[K]. Recent research has shown that gotu kola reduces scarring, improves circulatory problems in the lower limbs and speeds the healing process[238]. It is used internally in the treatment of wounds, chronic skin conditions (including leprosy), venereal diseases, malaria, varicose veins, ulcers, nervous disorders and senility[238, 240]. Caution should be observed since excess doses cause headaches and transient unconsciousness[238]. Externally, the herb is applied to wounds, haemorrhoids and rheumatic joints[238]. The plant can be harvested at any time of the year and is used fresh or dried[238]. Another report says that the dried herb quickly loses its medicinal properties and so is best used fresh[237].

nrakta E. Asia - India, China and Japan. Australia. ksacta Old stone walls and rocky sunny places in lowland hills and especially by the coast in central and southern Japan[58]. Shady, damp and wet places such as paddy fields, and in grass thickets[147, 238].

propta Seed - sow spring in a greenhouse[238]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a greenhouse for their first winter. Plant them out in late spring or early summer of the following year, after the last expected frosts[K]. Division is simple at any time in the growing season, though the spring is probably best[K]. We find that it is best to pot up the divisions until they are rooting away well, though in selected mild gardens it should be possible to plant the divisions out directly into their permanent positions[K].

nwatta Prefers a moist to wet soil in sun or partial shade[238]. Plants also grow on walls in the wild and so should tolerate drier conditions[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It grows and spreads very well outdoors during the summer in most parts of the country and is very easy to increase by division. It can therefore be grown as a summer crop with divisions being taken during the growing season and overwintered in a greenhouse in case the outdoor plants are killed by winter cold[K].

#### 8.2.296 Ophrys scolopax

Woodcock Orchid

1413

woodcock Orleint 7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli yre7t hionli

drutta Ophrys scolopax is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into

a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta S. Europe. ksacta Grassy places and stony ground.

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

# 8.2.297 Hemiphragma heterophyllum

7tlin10cyuc2kcak0tcan1dwat0.1m hkuc htut cyutli tcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Hemiphragma heterophyllum is a PERENNIAL growing to 0.1 m (0ft 4in) by 1 m (3ft 3in). See above for

USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw. The bright red ripe fruits are eaten fresh[272].

dwatta StypticThe juice of the plant is applied to cuts and wounds[272].

nrakta E. Asia - Western Himalayas. ksacta Dry slopes[272], forest and scrub at elevations of 1800 - 4000 metres[200, 272].

propta Seed - sow spring in a greenhouse[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first winter. Plant them out in late spring or early summer. Division of plants in mid spring[200]. Layering. Plants often produce new roots along the stems at the nodes[272]. Cuttings[272].

nwatta Grows best in a warm, sheltered sunny position in a light well-drained soil[200]. Plants are not very cold hardy, tolerating temperatures down to around -7°c[200]. It succeeds outdoors in the milder areas of Britain but elsewhere needs protection from winter cold[200]. A prostrate perennial, forming spreading carpets of growth[200].

### 8.2.298 Cyathodes fraseri

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.2 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hionli

drutta Cyathodes fraseri is an evergreen Shrub growing to 0.2 m (0ft 8in) by 0.3 m (1ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[2, 11, 128]. Sweet and juicy[1, 153, 173]. Contains up to 24% dry weight of oil[158]. (does this refer to the seed?[K]).

tcanta A most attractive ground cover plant for the winter garden[182].

nrakta Australia and New Zealand. ksacta Coastal dunes, lowland to sub-alpine open grassland and rocky places on North, South and Stewart Islands in New Zealandi 441.

propta Seed - surface sow in an ericaceous soil mix, February/March in a cold frame[164]. Do not exclude light[164]. Germination can take place within 1 - 2 months at 18°c but often takes as long as 3 - 5 years[200]. Scarification will reduce the germination time and 2 or 3 periods of 4 - 6 weeks cold stratification alternated with 4 weeks warm stratification can also help[175]. Perhaps sowing the seed as soon as it is ripe would also be beneficial[K]. The seedlings can be very slow to form roots and need to be potted up with great care[200]. Grow them on in the greenhouse for at least their first 2 growing seasons and, when large enough, plant them out into their permanent positions in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame. Neither easy nor reliable[200]. Air layering[200]. Division of the plants as they come into growth in the spring. We have found it best not to dig up the main clump, but to tease out small divisions from the sides of the plant. Make sure that these are well rooted and pot them up in light shade in a greenhouse. Grow them on for their first summer in the greenhouse and plant them out in late spring, after the last expected frosts.

nwatta Requires a moist well-drained lime-free humus rich soil in a sheltered site in partial or dappled shade[11, 164, 200]. Plants are very susceptible to drought[200]. A good rock garden plant[11]. Slow growing[11]. This plant is not very hardy in Britain though it succeeds outdoors in the milder areas of the country[1]. Plants grow best in areas with moderate winters and cool moist summers[200]. Plants have

is not large enough nor common enough for commercial production, though it is used locally for fencing posts, telegraph poles railroad ties and fuel[82, 229].

nrakta Southern N. America - Missouri to Texas, south to Mexico. ksacta Found at lower elevations, growing mainly on limestone hills or in soils underladen with limestone[229].

propta The seed requires a period of cold stratification. The seed has a hard seedcoat and can be very slow to germinate, requiring a cold period followed by a warm period and then another cold spell, each of 2 - 3 months duration[78, 81]. Soaking the seed for 3 - 6 seconds in boiling water may speed up the germination process[11]. The seed is best sown as soon as it is ripe in a cold frame. Some might germinate in the following spring, though most will take another year. Another possibility is to harvest the seed 'green' (when the embryo has fully formed but before the seedcoat has hardened). The seedlings can be potted up into individual pots when they are large enough to handle. Grow on in pots until large enough, then plant out in early summer. When stored dry, the seed can remain viable for several years[1]. Cuttings of mature wood, 5 - 10cm with a heel, September/October in a cold frame. Plant out in the following autumn[1, 78]. Layering in September/October. Takes 12 months[78].

nwatta Landscape Uses:Screen, Specimen, Street tree. Succeeds in most soils if they are well drained, preferring a neutral or slightly alkaline soil[1, 11, 200]. Established plants are drought tolerant, succeeding in hot dry positions[200]. They require a sheltered position in full sun[81]. This species is only hardy in the milder areas of Britain[81]. A slow-growing plant, though it may live for 200 - 350 years in good conditions[229]. Fruit production is cyclic, a year of heavy crops being followed by 1 - 2 years of light crops[229]. The seed ripens in its first year[229]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Attracts birds, North American native, Fragrant foliage, Inconspicuous flowers or blooms.

### 8.2.332 Illicium anisatum

Star Anise, Chinese Anise, Japanese Anise
7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat 6 m hkuc
hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatprik
hpa7tmwatli xre7t hjonli

drutta Illicium anisatum is an evergreen Shrub growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7 and is not frost tender. It is in leaf all year, in flower from March to May, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable PH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The essential oil obtained from this plant is poisonous[270]. The fruit is poisonous in quantity[19, 177].

kcakta Edible Parts: Edible Uses: CondimentThe fruit is used as a flavouring[2, 132, 177] and is also chewed after meals in order to sweeten the breath[4]. The fruit is about 25mm in diameter[2]. Some caution is advised because it is said to be poisonous in quantity[19, 177].

dwatta Antibacterial Carminative Diuretic Odontalgic Stimulant StomachicDiuretic, odontalgic, stimulant[4, 61]. The fruit is carminative, stimulant and stomachic[21, 240]. It is used primarily to promote digestion and the appetite, and to relieve flatulence[21]. It also makes a good additive to other medicines to improve their taste[21]. The leaves and the seeds are antibacterial[240].

nrakta E. Asia - S. China, Japan, Taiwan. ksacta Thickets and woods in foothills, S. and C. Japan[58].

propta Seed - it does not require pre-treatment and can be sown in early spring in a greenhouse[113]. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts, and give some protection from the cold over the winter for the first year or two. Layering in early spring. Takes 18 months[78]. Cuttings of half-ripe wood, August in a frame[113]. Pot up the cuttings when they start to root and grow them on in the greenhouse for their first winter, planting out after the last expected frosts.

nwatta Landscape Uses:Border, Pest tolerant, Massing, Screen, Woodland garden. Prefers a light, moist well-drained loam and a sheltered position[1, 11]. Prefers a humusrich lime-free soil[182, 200]. Succeeds in sun or semishade[200]. A slow-growing plant[188]. This species is not very cold-hardy, it tolerates temperatures down to about -10°c but normally requires the protection of a wall in most of Britain[184]. It succeeds outdoors in the mildest areas of the country[59]. Star anise is a very ornamental and aromatic plant that is much planted near Buddhist shrines and temples in Japan[184]. The plants have the scent of anise[219]. All parts of the plant are pleasingly aromatic. The leaves release a powerful aromatic odour when touched and the flowers have a spicy odour[245]. Plants seldom grow larger than about 2 metres in Britain, but are often 10 metres tall in their native habitat[58]. Special Features: Attracts birds, Fragrant foliage, Not North American native, Fragrant flowers. Attractive flowers or blooms.

#### 8.2.333 Marah fabaceus

Bigroot, California manroot,

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyif hjonli

drutta Marah fabaceus is a PERENNIAL CLIMBER growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The root is said to be poisonous to fish[257]. We have no reports as to whether or not it is toxic to mammals[K].

kcakta Edible Parts: LeavesEdible Uses: Used as a vegetable [177]. We do not know if the fruit, root or the leaves are used[K].

tcanta HairThe crushed seeds, mixed with oil, have been rubbed on the hair to prevent baldness[257].

nrakta South-western N. America - California. ksacta Banks and slopes below 750 metres in coastal strand and mixed evergreen forests[71].

propta Seed - sow early spring in pots of rich soil in a greenhouse. Germination usually takes place within 1 - 2 weeks at  $20\,^\circ\text{c}$ . Put 2 or 3 seeds in each pot and thin to the best plant. Grow on fast and plant out after the last expected frosts.

nwatta Requires a rich soil and abundant moisture[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. A climbing plant, supporting itself by means of tendrils[219].

### 8.2.334 Paliurus spina

Christ's Thorn, Jeruselem thorn

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 5 m hkuc

hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Paliurus spina-christi is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen from October to December. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or dried for later use. A pleasant sub-acid taste, somewhat resembling dried apples[183]. The woody fruit is up to 30mm in diameter[200]

tcanta Hedge HedgeThe plants are used for hedging they have a loose but bushy habit[11, 200].

dwatta Astringent Diuretic TonicAnticathartic, astrin gent, diuretic and tonic[218].

out before the cutting is inserted in the soil. Fair to good percentage[78]. Layering in summer[188].

nwatta Landscape Uses:Cascades, Erosion control Ground cover, Pest tolerant, Massing. Requires a welldrained moderately retentive soil in full sun or with part-day shade[200]. Requires a good humus-rich soil[11]. Succeeds in moderately alkaline or acid soils[202]. Requires the protection of a wall[11]. Plants are not very hardy outside the milder areas of Britain[166], but they can tolerate temperatures down to about -15°c when grown in a suitable position that makes sure the wood is fully ripened[200]. Young plants are particularly susceptible to cold winds[202]. A twining plant[182]. Plants are self-clinging on walls according to other reports[166, 200]. The plant is of slow to moderate growth[202]. Flowers are produced on short laterals that grow from old wood[200]. The flowers have a sweet refreshing perfume[245]. Special Features: Not North American native, Naturalizing, Fragrant flowers, Inconspicuous flowers or blooms, Flowers are rare.

#### 8.2.329 Photinia glabra

Japanese Photinia, Red Top, Red Leaf Photinia, 7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 6 m hkuc mimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Photinia glabra is an evergreen Shrub growing to 6 m (19ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower in May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - dried[177]. The fruit is about 5mm in diameter[200].

tcanta WoodThe wood is hard and heavy, suitable for making furniture and other small articles[266].

dwatta Anthelmintic DysenteryAnthelmintic. Also used in the treatment of obstinate dysentery, piles and jaundice[178, 218]

nrakta E. Asia - C. and S. Japan. ksacta Hills in Szechwan[178]. Slopes, mixed forests a elevations of 500 - 800 metres[266].

propta Seed - best sown in a cold frame as soon as it is ripe in the autumn. Stored seed will probably require stratification and should be sown as early in the year as possible[78]. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Basal cuttings in a frame[200]. Harvest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer. Cuttings of half-ripe wood, 7 - 10cm with a heel, July/August in a frame[11, 78]. They take about 2 months to root and should be overwintered in a greenhouse, planting out in late spring[78]. Fair to good percentage[78]. Cuttings of almost ripe side shoots, 7 - 12cm with a heel, October/November in a cold frame[78]. Lift the following autumn and plant in their permanent positions[78]. Layering in autumn. Partially sever the layer about 12 months later and lift in the following spring. High percentage[200]

nwatta Landscape Uses:Screen, Standard, Specimen, Street tree. Requires a well-drained fertile soil in a sheltered position in sun or light shade[1, 200]. Prefers a warm soil that is not too heavy or close[11]. Tolerates calcareous soils[11, 200]. Dislikes windy sites[11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°c[200]. Plants are susceptible to fireblight[200]. Plants in this genus are notably resistant to honey fungus[200]. Plants are very tolerant of pruning[202]. There are some named forms selected for their ornamental value[200]. Special Features:Attractive foliage, Not North

American native, Fragrant flowers, Flowers have an unpleasant odor, Attractive flowers or blooms.

### 8.2.330 Daphniphyllum himalense

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 6 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Daphniphyllum himalense is an evergreen Tree growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: The very closely related D. macropodum is said to have edible leaves. Are the leaves of this species also edible cooked?[K]

tcanta WoodWood - soft, close and even grained, very handsome. Used for turnery, carving etc[146, 272]. The wood of the roots is especially handsome, it is deep red in colour[158].

dwatta SkinA paste of the wod is applied as a poultice to boils[272].

nrakta E. Asia - Central and Eastern Himalayas to Northern Burma. ksacta Cool moist forests[200], shady ravines[158] and valleys alongside streams, 1200 - 3000 metres[146].

propta Seed - sow spring in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of moderately ripened wood, 7 - 10cm with a heel or at a junction with old wood, July in individual pots in a frame. The cuttings are slow to root, give them brisk bottom heat[78]. Fair percentage[78]. Layering of current seasons growth, 12cm long in August/September. Takes 12 - 18 months. High percentage[78].

nwatta Succeeds in any good soil, tolerating lime but perhaps not suitable for very chalky soils[11]. A useful plant for moist shady positions[11]. Dislikes cold drying winds[200]. D. macropodum. Miq. is hardy at Kew and tolerates temperatures down to about -20°c[11, 184]. It is very closely related to this species and is perhaps no more than a sub-species of it[11]. This species, however, is less hardy than D. macropodum[182]. The flowers have a pungent aroma[182]. They are produced in racemes on the previous year's wood[11]. Dioecious, male and female plants must be grown if seed is required.

### 8.2.331 Juniperus ashei

Ashe Juniper, Mountain Cedar

1426

7 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Juniperus ashei is an evergreen Tree growing to 6 m (19ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. The cones are about 6 - 8mm in diameter[200], they are thin-skinned sweet, juicy and resinous[82, 229].

tcanta WoodWood - close-grained, hard, durable, slightly fragrant, light and easily worked[82, 229]. The wood

very fine root systems and great care must be taken when transplanting them[157].

### 8.2.299 Liriope graminifolia

Lilvturf

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.3 m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Liriope graminifolia is an evergreen Perennial growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to August, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: RootEdible Uses: Root -cooked[105, 177, 179]. Candied and used medicinally[61]. The root has a fleshy, tuberous part near its tip[266]. Rich in mucilage, the root also contains about 1.6% protein, 0.5% fat, 80% carbohydrate and 2.3% ash[179].

tcanta A good drought tolerant evergreen ground cover plant[200].

dwatta Aphrodisiac Pectoral StimulantThe root is aphrodisiac, pectoral and stimulant[61].

nrakta E. Asia - China, Japan. ksacta Lowland and foothills all over Japan[58]. Forests, thickets, shady places along ravines, grassy and rocky places from near sea level to 2300 metres[266].

propta Seed - we have no information on this species but suggest sowing it in a cold frame or greenhouse as soon as the seed is ripe if possible, if not then sowing the stored seed in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a sandy soil[1]. Succeeds in full sun so long as the soil does not dry out in the summer, otherwise it should be grown in partial shade in any moderately fertile well-drained soil[200]. Not very hardy in Britain, it is best to give the plants some protection in the winter[1]. Members of this genus are rarely if ever troubled by browsing deer[233]. Most plants grown under this name in British gardens are actually L. muscari[200]. The Flora of Japan treats L. graminifolia as two separate species, L. minor. (Maxim.)Makino. and L. platyphylla. F.T.Wang. and Tang. The New RHS Dictionary of Gardening recognizes L. graminifolia as a distinct species and gives L. platyphylla as a synonym of L. muscari whilst allotting specific status to L. minor as a plant closely related to L. muscari. This is the treatment followed here.

### 8.2.300 Asparagus filicinus

Fern Asparagus

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.7 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Asparagus filicinus is a PERENNIAL growing to 0.7 m (2ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June, and the seeds ripen from July to August. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots cooked[158, 177]. Used as a vegetable[272].

1415

dwatta Antipyretic Antitussive Diuretic Expectorant Nervine Stomachic TonicThe dried root is antipyretic, antitussive, diuretic, expectorant, stomachic, nervous stimulant and tonic[218].

nrakta E. Asia - China, India. ksacta Loose humus rich soils in forests, 1700 - 2700 metres in the Himalayas[145]. Forests, thickets, shady and moist places along valleys; 1200 - 3000 metres in western China[266].

propta Seed - pre-soak for 12 hours in warm water and then sow in spring or as soon as the seed is ripe in early aumm in a greenhouse. It usually germinates in 3- 6 weeks at  $25\,^{\circ}\mathrm{c}[134].$  Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a sunny position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Division in early spring as the plant comes into growth.

nwatta Easily grown in any good garden soil[200]. Prefers a rich sandy loam[1]. Plants are hardy to between -10 and -15°c[200]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.301 Arum dioscoridis

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.3 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Arum dioscoridis is a PERENNIAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf from October to July, in flower in May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semishade (light woodland) or no shade. It prefers moist soil.

pcista The plant contains calcium oxylate crystals. These cause an extremely unpleasant sensation similar to needles being stuck into the mouth and tongue if they are eaten, but they are easily neutralized by thoroughly drying or cooking the plant or by steeping it in water[65].

kcakta Edible Parts: RootEdible Uses: Tuber - cooked and used as a vegetable[2, 61, 105, 177]. It must be thoroughly dried or cooked before being eaten, see the notes above on toxicity.

dwatta AbortifacientThe root is abortifacient[61].

nrakta S. Europe and N. Africa - E. Mediterranean. ksacta Hedges and rocky places, often on calcareous soils[90, 200]

propta Seed - best sown in a greenhouse or cold frame as soon as it is ripe[134]. The seed usually germinates in 1 - 6 months at 15°c[134]. Stored seed should be sown in the spring in a greenhouse and can be slow to germinate, sometimes taking a year or more. A period of cold stratification might help to speed up the process. Sow the seed thinly, and allow the seedlings to grow on without disturbance for their first year, giving occasional liquid feeds to ensure that they do not become mineral deficient. When the plants are dormant in the autumn, divide up the small corms, planting 2 - 3 in each pot, and grow them on in light shade in the greenhouse for a further year, planting out when dormant in the autumn. Division of the corms in summer after flowering[200]. Larger corms can be planted out direct into their permanent positions, though it is best to pot up the smaller corms and grow them on for a year in a cold frame before planting them out.

nwatta Prefers a humus rich soil and abundant water in the growing season[1]. Grows well in woodland conditions[1]. Succeeds in sun or shade. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Because it comes into growth in the late autumn it is best grown by a warm wall or in a bulb frame[90] A polymorphic species[200]. The inflorescence is pollinated by flies and it smells of dung and carrion in order to attract the flies[200]. It also has the remarkable ability to heat itself above the ambient air temperature to such a degree that it is quite noticeable to the touch[4]. This probably protects the flowers from damage by frost, or allows it to penetrate frozen ground. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.302 Rubus rolfei

'Emerald Carpet' raspberry

7 tlin 9 cyuc 2 kcak 3 tcan 0 dwat 0.1 m hkuc

pcimhmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flat-priklwis hpa7tmwatli xre7t hjonli

drutta Rubus rolfai is an evergreen Shrub growing to 0.1 m (0ft 4in) by 0.6 m (2ft). It is not frost tender. It is in leaf all year, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[183]. The yellow to orange-reddish fruit is up to 14mm in diameter[266].

tcanta DyeA purple to dull blue dye is obtained from the fruit[168]. A good ground cover plant for a sunny position or deep shade[11]. It makes a firmly matted cover though it requires weeding for the first year or so[197]. Plants are best spaced about 60cm apart each way[208].

nrakta E. Asia - Formosa. ksacta Open places, mixed forests at elevations of 1300 - 3800 metres[266].

propta Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about  $3^\circ c$  and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year. Cuttings of half-ripe wood, July/August in a frame[200]. Division in early spring or just before leaf-fall in the autumn[200].

nwatta Easily grown in a good well-drained loamy soil in sun or semi-shade[1, 11, 200]. Succeeds in deep shade. Plants are evergreen in most climates but they can lose their leaves in severe winters. Occasionally cultivated for its edible fruit, there are some named varieties[183], 'Emerald Carpet' is an ornamental thornless form with orange berries that resemble small raspberries[183]. Plants in this genus are notably susceptible to honey fungus[200]. Rubus pentalobus Hayata is a synonym of Rubus rolfei J.E.Vidal The plant is heat tolerant in zones 9 through 7. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree. shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. An evergreen. A clumping mat former. Forming a dense prostrate carpet with a limited spread [1-2]. The root pattern is suckering with new plants from underground runners away from the plant [1-2].

#### 8.2.303 Cyathodes colensoi

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.3 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Cyathodes colensoi is an evergreen Shrub growing to 0.3 m (1ft) by 0.3 m (1ft) by 0.3 m (1ft) by 0.3 m (1ft) colensor as low rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked. A sweet mealy flesh[153]. Rarely seen on plants growing in Britain[11]. The fruit is about 5mm in diameter[200]. One report says that the fruit contains up to 24% by dry weight of oil[153], does this refer to the seed?[K].

tcanta A most attractive ground cover plant for the winter garden[182].

nrakta New Zealand. ksacta Montane to lower subalpine open grassland to rocky places and fellfield on North and South Islands[44].

propta Seed - surface sow in ericaceous soil, February/March in a cold frame[164]. Do not exclude light[164]. Germination can take place within 1 - 2 months at 18°c but often takes 3 - 5 years[200]. Scarification will reduce the germination time and 2 or 3 periods of 4 - 6 weeks cold stratification alternated with 4 weeks warm stratification can also help[175]. Perhaps sowing the seed as soon as it is ripe would also be beneficial[K]. The seedlings can be very slow to form roots and need to be potted up with great care[200]. Grow them on in a greenhouse for at least two years before planting them out in late spring or early summer. Cuttings of half-ripe wood, July/August in a frame[188]. Neither easy nor reliable[200]. Air layering[200].

nwatta Requires a moist well-drained lime-free humus rich soil in a sheltered site in partial or dappled shade[11, 164, 200]. Plants are very susceptible to drought[200]. A good rock garden plant. Slow growing[11]. This species is fairly hardy in Britain but it can be damaged in very severe winters[11]. Another report says that it is only hardy to about -5°c[200], but plants have been seen growing on a very shady north-facing slope in a rock garden at Kew, which experiences lower temperatures than this[K]. These plants were undamaged after the very cold winter of 1996 - 97 and were flowering freely in April 1997[K]. Plants grow best in areas with moderate winters and cool moist summers[200]. The sweetly scented flowers are produced in axillary clusters[245]. Plants have very fine root systems and great care must be taken when transplanting them[157].

### 8.2.304 Carpobrotus edulis

Hottentot Fig

7 tlin 10 cyuc 2 kcak 2 tcan 2 dwat 0.1 m hkuc

htut cyutli hgatkyuctcup hwicli hyishras hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Carpobrotus edulis is a PERENNIAL growing to 0.1 m (0ft 4in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from May to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

kcakta Edible Parts: Fruit LeavesEdible Uses: Fruit - raw, cooked, dried for later use or made into pickles, chutney etc[1, 2, 3, 5, 7, 183]. There is very little flesh in the fruit and it must be fully ripe otherwise it is very astringent[K]. Mucilaginous and sweetly acid[183]. Leaves - raw or cooked[2, 173]. Succulent, they are eaten in salads and can also be used as a substitute for pickled cucumber[183]. We find them too mucilaginous to be enjoyable[K].

tcanta Fire retardant Soil stabilization TanninUsed in maritime areas to prevent soil erosion in sandy soils[188, 200]. Plants form a dense carpet and make an effective ground cover[208]. Can be grown as a fire barrier in areas subject to forest fires, it is moderately fire retardant[200]. The dried leaves contain about 19.4% tannin and the dry stems 14.2%[223]. Yields of 1700 kilos per hectare of cultivated plants have been achieved[223]. A popular plant for growth as an ornamental or for ground cover [1d].

dwatta Used as a traditional medicinal plant (GRIN, 2008), some anti-cancer properties have been shown by methanolic extracts of C. edulis (Ordway et al., 2003); and also anti-bacterial properties (van de Watt and Pretorius, 2001)[1d].

nrakta S. Africa - Cape Province. Naturalized in Britain[17]. ksacta Sandy and rocky places by the sea[260]. Naturalized on cliffs and banks by the sea in Cornwall and S. Devon[17].

propta Seed - surface sow March to June in a greenhouse. Lower night-time temperatures are beneficial. The seed usually germinates in 7 - 10 days at 23°c[138]. When in Anhui, Fujian, Gansu, Guizhou, Henan, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan and Yunnan [266].

propta Seed - sow March in a warm greenhouse[1]. This note probably refers to the tropical members of the genus, seeds of plants from cooler areas seem to require a period of cold stratification, some species taking 2 or more years to germinate[K]. We sow the seed of temperate species in a cold frame as soon as we receive it, and would sow the seed as soon as it is ripe if we could obtain it then[K]. When the seedlings eventually germinate, prick them out into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first year, though we normally grow them on in pots for 2 years. Plant them out into their permanent positions in early summer. Division in early spring as new growth begins[238]. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer. Cuttings of half-ripe shoots, July in a frame[238].

nwalta Succeeds in most soils in sun or semi-shade[200]. Not very hardy in Britain, it tolerates temperatures down to about -10°c and succeeds outdoors in milder parts of the country[200]. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.326 Metrosideros excelsa

Pohutukawa

7 tlin 10 cvuc 1 kcak 0 tcan 1 dwat 7 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Metrosideros excelsa is an evergreen Tree growing to 7 m (23ft) by 15 m (49ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. The plant can tolerate maritime exposure

kcakta Edible Parts: NectarEdible Uses: An edible nectar is obtained from the flowers[173].

tcanta Hedge Hedge WoodPlants can be used as a hedge, succeeding in exposed maritime positions[166, 200]. Wood - dense, compact, heavy, durable, very strong. Used for ship-making, bearings, machine beds etc/46, 611.

dwatta Astringent DysenteryAstringent. Used in the treatment of dysentery[46, 61].

nrakta New Zealand. ksacta Coastal forests in North and Three Kings Islands[44].

propta Seed - sow spring in a warm greenhouse and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Give the plants some protection from the cold for at least their first winter outdoors. Cuttings of half-ripe wood, 7 - 10cm with a heel, in individual pots in a frame. Good percentage[200].

nwatta Prefers a well-drained but moisture-retentive lime-free soil in a sunny position[182, 200]. Plants are somewhat lime-tolerant but are unsuitable for shallow soils over chalk[200]. Very resistant to maritime exposure[166, 200]. This species is not very hardy in Britain, tolerating temperatures down to about -5°c[184] and succeeding outdoors only in the mildest areas of the country where it makes a small shrub[1, 200]. Plants grow very well on the Isles of Scilly, where they are cut back by cold perhaps once every twenty years. They usually sprout again from their thick branches[260]. A good bee plant[173]. Very ornamental[1]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.327 Adenostoma sparsifolium

Rodehank

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 6 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Adenostoma sparsifolium is an evergreen Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Seeds[257]. No further information is given.

tcanta The bark is fibrous and has been stripped off the plants to make women's skirts[257]. The wood has been used to make fencing posts and as construction material[257]. The wood burns well, giving a high intensity heat[257].

dwatta The plant is cathartic[257]. The plant has been used externally in the treatment of arthritis[257]. An infusion of the leaves has been used in the treatment of colds and chest complaints, and also as a mouth wash to treat toothaches[257]. An infusion of the dried leaves, or the branches, has been used in the treatment of stomach ailments, inducing either bowel movements or vomiting[257]. The crushed twigs have been mixed with oil and used as a salve[257].

nrakta South-western N. America - Southern California. ksacta Grows in chapparal at elevations of 300 - 2500 metres[276].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in early spring. When large enough to handle, prick the seedlings out into individual pots and grow the plants on for at least their first winter in a greenhouse or cold frame, planting them out in late spring or early summer, after the last expected frosts. Cuttings could be tried in August of half-ripe wood, preferably with a heel, in a frame. Lavering.

nwatta Requires a sheltered sunny position in a well-drained soil[182, 200] and protection from cold winds[200]. Plants are not very hardy in Britain and do not withstand exposure to prolonged winter frosts though they succeed out-doors in the milder areas of the country[182, 200]. In colder areas they are best grown against a south or south-west facing wall[200]. The leaves are resinous and catch fire easily[181]. They have a pleasant aroma[200].

#### 8.2.328 Trachelospermum asiaticum

Japanese Star Jasmine, Small Leaf Confederate Jasmine, Asiatic Jasmine

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Trachelospermum asiaticum is an evergreen Climber growing to 6 m (19ft) by 6 m (19ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 9. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young buds - cooked[105, 177]. No more details are given, we do not know if it is the leaf or flower buds that are referred to

tcanta Can be grown as a ground cover plant in a sunny position[188]. One of the most common ground cover plants used in Texas[274].

nrakta E. Asia - Japan, Korea. ksacta Thickets in hills and low mountains, C. and S. Japan[58]. Growing in scrub and climbing up trees in the forest[260].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in early spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 6 - 8cm with a heel, August in a frame. Ensure that the milky sap, which is excreted from the heel when the cutting is taken, has dried

permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11]. plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. This species is not very hardy outdoors in Britain[1], but it succeed in the milder areas of the country, tolerating temperatures down to between -5 and -10°c[200]. This species flowers on the current year's growth[200]. Any pruning is best carried out in spring, hedges are also best trimmed at this time[188]. Plants are tolerant of severe pruning, sprouting freely from old wood[K]. Plants in this genus are notably resistant to honey fungus[200].

### 8.2.323 Dicksonia antarctica

Tree Fern Australian treefern

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 9 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Dicksonia antarctica is an evergreen Fern growing to 9 m (29ft) by 4 m (13ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland). It prefers moist soil.

pcista Although we have found no reports of toxicity for this species, a number of ferns contain carcinogens so some caution is advisable[200]. Many ferns also contain thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people eating an adequate diet that is rich in vitamin B. though large quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172].

kcakta Edible Parts: Leaves StemEdible Uses: The pith in the upper part of the trunk just below the growing point is eaten raw or roasted[46, 61, 154, 193]. It is rich in starch[105, 144] but also contains tannin and is astringent[154]. Descriptions of the taste vary from bitter to sweet, astringent and like a bad turnip[193]. The core of the plant near the growing tip is used[193]. Harvesting the stem kills the plant so this use cannot normally be condoned[193]. The stem contains about 61 kilocalories per 100g[193]. Young leaves - cooked. Harvested just before they unfurl, they are juicy and slimy, tasting like bitter celery[193].

tcanta Soil stabilizationThis species is used in New Zealand to stabilize roadside cuttings[200].

dwatta AstringentAstringent[154].

nrakta Australia - New South Wales, Tasmania, Victoria. ksacta Damp sheltered woodland slopes and moist gullies[144].

propta Spores - can be sown at any time in a warm greenhouse. Surface sow and enclose the pot in a plastic bag in order to keep it moist. Place in light shade. Germinates in 1 - 3 months at 20°c. Prick out small clumps of plants when they are large enough to handle and grow on in a shaded part of the greenhouse for at least the first 2 years. Plant out in late spring after the last expected frosts. The spores can be stored dry for up to 10 years[200].

nwatta Requires a sheltered woodland position and a moist soil[11, 200]. Strongly resents drought or dryness at the roots[200]. A very ornamental plant[1], it is hardy to about -5°c[184, 200], succeeding outdoors in the milder areas of Britain where it thrives and often self-sows in Cornish gardens[49]. One report says that some forms are hardy to at least -7°c[157]. Plants can tolerate snow but are intolerant of severe frosts[11, 200]. Members of this genus are rarely if ever troubled by browsing deer[233]. The 'trunk' of

this plant is merely the decaying remains of earlier growth of the plant and forms a medium through which the roots grow[157]. Plants can be cut down and, if they are kept moist, the top portions can be replanted and will form new roots[157]. The stump, however, will not regenerate since it is simply dead organic matter[157]. It is best to leave old fronds on the plant in order to protect the trunk from cold and desiccation[166].

### 8.2.324 Chilopsis linearis

Desert Willow

7 tlin 11 cyuc 1 kcak 0 tcan 1 dwat 9 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Chilopsis linearis is a deciduous Shrub growing to 9 m (29ft 6in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers SeedpodEdible Uses: The blossoms and seedpods have been used for food[257].

tcanta Basketry Fibre WoodThe young pliable twigs are woven into baskets[227, 274]. The bark is removed and the shoots are used unsplit as rod foundations in coil basketry[257]. The bark has been used to make shirts and nets[257]. Wood - coarse-grained, soft, weak, rather durable in the soil. Used for fence posts and fuel[227].

dwatta PectoralA decoction of the flowers is used for coughs and bronchial disturbances[227].

nrakta South-western N. America - California to Texas south to Mexico, ksacta Gravelly or rocky soils in arid desert washes and desert grasslands 400 - 1600 metres[227 229] Plants attain their greatest size when growing along streams and in low places[229].

propta Seed - we have very little information on this species but would suggest sowing the seed in a greenhouse in the spring. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. It will probably pay to protect the plants for their first winter or two in the open ground. There are about 75,000 seeds per pound, only half of which are viable. About 4.000 plants are usually raised from a pound of seed[227]. Grows readily from cuttings[227].

nwatta Landscape Uses:Border, Pollard, Standard, Specimen. Requires a very warm sunny position in a very well-drained soil[260]. Plants are likely to be intolerant of wet conditions especially in the winter (K). This species is not very hardy outdoors in Britain, tolerating temperatures down to about -3°c[260]. The showy flowers are fragrant[229]. Special Features: Attracts birds, North American native, Fragrant flowers, Blooms are very showy.

#### 8.2.325 Smilax discotis

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 7 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Smilax discotis is a deciduous Climber growing to 7 m (23ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). . The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[177]. The black fruit is up to 8mm in diameter[266]. No more details are given.

nrakta E. Asia - China. ksacta Forests, thickets and shaded places on slopes at elevations of 600 - 2100 metres

they are large enough to handle, prick the seedlings out into USDA hardiness. It is hardy to UK zone 8 and is frost tenindividual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings at any time during the growing season. Allow the cutting to dry in the sun for a day or two then pot up in a very sandy mix. Very easy[K].

nwatta Requires a well-drained sandy soil in a sunny position[1, 200]. Plants can be grown on dry walls or in the flower border[166]. Established plants are very drought resistant[200]. Very resistant to wind and salt spray[166]. Moderately fire-retardant[200]. Plants are not very frost resistant and can be killed by temperatures below about -2°c. They have naturalized themselves on cliffs along the coast of S. Britain but do not succeed inland unless grown in a sunny sheltered position[200]. A vigorous prostrate plant, rooting as it spreads. The flowers only open in the afternoon[200]. Grows on shallow soil [1d].

### 8.2.305 Chlorogalum parviflorum

Smallflower Soapplant

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flat-

priklwis hpa7tmwatli xre7t hjonli drutta Chlorogalum parviflorum is a BULB growing to 0.6 m (2ft) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista The bulb contains saponins. Although fairly toxic, these substances are very poorly absorbed by the body and most of them simply pass straight through. Saponins are found in a number of common foods, including many beans They are destroyed by thorough cooking[K]. Saponins are much more toxic to some creatures, such as fish, and hunting tribes have traditionally put large quantities of them in streams, lakes etc in order to stupefy or kill the fish[K].

kcakta Edible Parts: RootEdible Uses: Bulb cooked[105, 161, 177]. A slow baking will remove any soapiness in the taste. The bulbs can be very large and are up to 7cm in diameter[270].

nrakta South-western N. America - California, ksacta Dry open areas of coastal sage scrub from sea level to 800 metres[270]

propta Seed - sow spring or summer 2mm deep in a peat/sand mix. Germination usually takes place within 1 -6 months at 15°c, but it can be slow and erratic. Sow the seed thinly so that the seedlings do not need to be thinned and grow them on in the pot for their first year of growth. giving an occasional liquid feed o ensure that they do not become mineral deficient. When dormant, pot up 3 young bulbs per pot and grow them on for at least another 2 years before planting them out into their permanent positions in the spring[164]. Division of offsets when the bulb dies down in late summer. Larger offsets can be planted out direct into their permanent positions but it is best to pot up the smaller bulbs and grow them on for at least a year in the greenhouse.

nwatta Succeeds in any reasonably good well-drained soil[1, 42]. Prefers a rich well-drained moisture retentive soil[164]. Tolerates partial shade[164]. Dislikes dry soils according to one report[200] but plants grow in dry soils in the wild[71]. Plants are frost hardy but they come into new growth in the autumn and so need to be grown in a warm sheltered position, especially in colder areas of the coun-

### 8.2.306 Carpobrotus deliciosus

Sweet Hottentot Fig

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwishsom hpa7tmwatli xre7t hionli

drutta Carpobrotus deliciosus is an evergreen Perennial growing to 0.2 m (0ft 8in) by 1 m (3ft 3in). See above for der. It is in leaf all year. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or used as a garnish for fruit salads[183, 200]. The fruit can also be dried and eaten like candy or made into jams and preserves[183]. There is very little flesh in the fruit and it must be fully ripe otherwise it is very astringent[K].

tcanta Fire retardant Soil stabilizationThe plant is moderately fire-retardant and can be planted as a barrier to the spread of forest fires in Mediterranean and similar climates[200]. Planted on sunny banks and sandy soils in order to prevent soil erosion[200].

nrakta S. Africa - Cape Province and Riversdale districts. ksacta Not known

propta Seed - surface sow March to June in a greenhouse. Lower night-time temperatures are beneficial. The seed usually germinates in 7 - 10 days at 23°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer after the last expected frosts. Cuttings at any time during the growing season. Allow the cutting to dry in the sun for a day or two then pot up in a very sandy mix. Very easy[K].

nwatta Requires a well-drained sandy soil in a sunny position[1, 200]. Plants can be grown on dry walls or in the flower border[166]. Established plants are very drought resistant[200]. Very resistant to wind and salt spray[166]. Moderately fire-retardant[200]. Plants are not very frost resistant, they can be damaged by temperatures below about -2°c and only succeed outdoors in the milder areas of the country[200]. A vigorous prostrate plant, rooting as it spreads. The flowers only open in the afternoon[200].

### 8.2.307 Ophrys iricolor

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Ophrys iricolor is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe - Mediterranean. ksacta Chalk and marl soils in Israel.

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able

to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. This species is not hardy in the colder areas of the country it tolerates temperatures down to between -5 and -10°c[200]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

#### 8.2.308 Microcachrys tetragona

7 tlin 10 cyuc 2 kcak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Microcachrys tetragona is an evergreen Shrub growing to 0.2 m (0ft 3in) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw[K]. It is rather small, about the size of a small blackcurrant, and does not have much flavour[K].

nrakta Australia - Tasmania. ksacta Mountains in the alpine and sub-alpine zones[11].

propta Seed - best sown as soon as it is ripe in a cold frame. The seed can be very slow to germinate, stored seed often requiring 12 months stratification[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Bird-sown seedlings, if they can be obtained, are the best way of propagating this plant[200].

nwatta Requires a moist soil and very high humidity with plenty of rain[200]. Succeeds on a north facing slope[11]. This species is fairly hardy in Britain, succeeding outdoors in all but the coldest parts of the country[200]. A slow growing plant[157]. Plants are usually dioecious but monoecious

forms are sometimes found. Female plants can set fruit in the absence of a male but male plants must also be grown if fertile seed is required[11].

#### 8.2.309 Ophrys lutea

Yellow Bee Orchid

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Ophrys lutea is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf from October to June, in flower from March to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Ūses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe - Mediterranean. ksacta Calcareous soils in open places in the maquis and garigue, often in full sun[230].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants prefer a shady position[188]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will

long outdoors in Britain, even though it is the hardiest member of the genus[1]. Another says that it is quite hardy in Britain[11] whilst a third says that it can tolerate temperatures down to about -7°c[200]. A specimen planted at Kew in 1987 was  $2^{1/2}$  metres tall and looking very healthy in August 1999[K]. Trees are relatively slow-growing in the wild[229].

### 8.2.320 Maytenus boaria

Mayten Tree, Mayten

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Maytenus boaria is an evergreen Tree growing to 10 m (32ft) by 8 m (26ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: OilEdible Uses: OilAn edible oil is obtained from the seed. Used for cooking[183].

nrakta S. America - Argentina and Chile. ksacta Pasturelands, avoiding the competition for light from other trees[11].

propta Seed - we have no information for this species but suggest sowing the seed in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200]. Division of suckers in the autumn or spring[188].

nwatta Succeeds in most soils in a sunny position[182] and also in semi-shade[188]. The soil should be well-drained but must not be allowed to dry out[200]. Requires a position sheltered from strong cold winds[188]. Tolerates temperatures down to about to about -10°c[200]. This species has a very wide natural range, so far all the introductions have come from Chile but provenances in Argentina might provide even hardier trees that could succeed in colder areas of the country[11]. Plants succeed outdoors in S. England and have produced self-sown seedlings at Lanarth in Cornwall[11]. Large mature trees are growing in woodland conditions at Hilliers Arboretum in Hampshire[K]. The flowers are usually either male or female, though both sexes are found on the same plant[219]. Occasional hermaphrodite flowers are produced[219]. Cattle are very strongly attracted to the leaves of this plant and will not touch other forage when this species is available[11]. A slow growing tree[200].

### 8.2.321 Ilex cassine

Cassine, Dahoon, Cassine Holly 7 tlin 11 cyuc 1 kcak 0 tcan 1 dwat 10 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta llex cassine is an evergreen Tree growing to 10 m (32ft 10in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in leaf all year, in flower from May to June, and the seeds ripen from October to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

kcakta Edible Parts: Edible Uses: TeaThe dried roasted leaves can be used as a tea substitute[161, 177]. Some caution is advised since it can cause dizziness and have a laxative effect[183].

tcanta Soap WoodThe plant has been used as a soap[257]. No more information is given. Wood - soft, light, close-grained, not strong[82]. It weighs 30lb per cubic foot[235]. Of no commercial importance[229].

dwatta Emetic Hypnotic LaxativeThe leaves are hypnotic and laxative[183, 192]. A strong decoction of the plant was used by some native North American Indian tribes to induce vomiting. This was seen partly as a physical and partly a spiritual cleansing[257].

nrakta South-eastern N. America - Virginia to Florida, west to Texas. ksacta Cold swamps and on their borders in rich moist soils. Occasionally also found on high sandy banks of pine barren streams[82].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Landscape Uses:Pest tolerant, Specimen. Tolerates most soils that are not water-logged[200]. A slow-growing and generally short-lived species in the wild[229]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Flowers are produced on the current year's growth[229]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required. Special Features: Attracts birds, North American native, Wetlands plant, Inconspicuous flowers or blooms.

#### 8.2.322 Tamarix aphylla

Athel Tamaris

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 10 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hjonli

drutta Tamarix aphylla is a deciduous Tree growing to 10 m (32ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: MannaEdible Uses: DrinkA sweet manna-like substance that forms on the twigs is used to adulterate cane sugar[177, 183]. It can also be eaten with porridge etc or mixed with water to make a refreshing drink[183].

tcanta Hedge Hedge TanninVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens[229]. Galls produced on the twigs and flowers (probably as a result of insect activity[K]) contain up to 55% tannin[223]. The wood has been used for fuel[257].

dwatta Astringent BitterThe galls are astringent[240] The bark is astringent and bitter[240].

nrakta W. Asia to N.E. Africa. ksacta Wadis in hot desert areas in salty and non-salty habitats.

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their

tcanta WoodWood - hard, heavy, close-grained, very strong, rather brittle[82, 229, 235]. It weighs 40lb per cubic foot[235]. The wood works well and is suitable for interior uses such as cabinets, but trees with large straight trunks are not sufficiently common to make the tree of commercial interest[229].

dwatta Abortifacient Analgesic Antirheumatic Appetizer Emetic FebrifugeRed bay was widely employed medicinally by the Seminole Indians who used it to treat a variety of complaints, but especially as an emetic and body cleanser[257]. It is little, if at all, used in modern herbalism. The leaves are abortifacient, analgesic, antirheumatic, appetizer, emetic and febrifuge[257]. An infusion can be used to abort a foetus up to the age of four months[257]. An infusion is also used in treating fevers, headaches, diarrhoea, thirst, constipation, appetite loss and blocked urination[257]. A strong decoction is emetic and was used as a body purification when treating a wide range of complaints[257]. A decoction of the leaves is used externally as a wash on rheumatic joints and painful limbs[257].

nrakta South-eastern N. America - Virginia to Florida, west to Texas. ksacta Sandy to rich moist soils of low woodlands, coastal forests, along the sides of bogs, streams and swamps[229]. Sometimes found in dry sandy areas in Florida[229].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in early spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for their first 2 winters. Plant them out into their permanent positions in early summer and give some protection from winter cold for their first winter or two outdoors.

nwatta Landscape Uses:Pest tolerant, Seashore, Specimen. Street tree. We have found no cultivation details for this species in Britain, though the tree is likely to require a welldrained light to medium soil in a sunny sheltered position[K]. It is only likely to be hardy in the mildest areas of the country[11]. Special Features: Attracts birds, Attractive foliage, North American native, Fragrant foliage, Attracts butterflies, Inconspicuous flowers or blooms. The plant is heat tolerant in zones 12 through 8. (Plant Hardiness Zones show how well plants withstand cold winter temperatures. Plant Heat Zones show when plants would start suffering from the heat. The Plant Heat Zone map is based on the number of "heat days" experienced in a given area where the temperature climbs to over 86 degrees F (30°C). At this temperature, many plants begin to suffer physiological damage. Heat Zones range from 1 (no heat days) to 12 (210 or more heat days). For example Heat Zone. 11-1 indicates that the plant is heat tolerant. in zones 11 through 1.) For polyculture design as well as the above-ground architecture (form - tree, shrub etc. and size shown above) information on the habit and root pattern is also useful and given here if available. The plant growth habit is a standard with a non-suckering single trunk [1-2]. An evergreen

### 8.2.318 Firmiana simplex

Chinese Parasol Tree, Chinese parasoltree, Japanese Varnish Tree, Chinese Parasol Tree

7 tlin 10 cvuc 1 kcak 0 tcan 1 dwat 15 m hkuc

hmimhtut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Firmiana simplex is a deciduous Tree growing to 15 m (49ft) by 10 m (32ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 9. It is in flower in July. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: SeedEdible Uses: Seed roasted[105, 177]. An oily texture[178].

tcanta Fibre Hair WoodA fibre is obtained by retting the bark[46, 61]. It is used for coarse cordage[109] and cloth[178]. A hair wash is made from the leaves and fibre[178]. Wood. Used for making furniture and coffins[46. 61. 1781.

dwatta Antiphlogistic Astringent Expectorant Refrigerant SalveAstringent, salve[178]. The seed is antiphlogistic,

1422

expectorant and refrigerant[218]. A decoction of the roots is used to reduce swellings[218]. A lotion of the leaves is used in the treatment of carbuncles, haemorrhoids and sores[218].

nrakta E. Asia - China. ksacta Along the sides of roads at low altitudes[109].

propta Seed - best sown as soon as it is ripe in a warm greenhouse[200]. The stored seed can be sown in the early spring in a greenhouse[1] and usually germinates within 2 months[K]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Consider giving the plants some protection from the cold for at least their first winter out-

nwatta Industrial Crop: Fiber Industrial Crop: Gum Management: Standard Regional CropLandscape Uses: Pest tolerant, Pollard, Specimen. Prefers a good sandy loam[1]. Requires a well-drained but moisture-retentive fertile soil in full sun or light shade[188]. Plants are not very hardy in Britain, they succeed outdoors in the mildest parts of the country[11, 166], though they do not reach tree-size[188]. Trees cast a heavy shade[178]. Special Features:Not North American native, Naturalizing, Attractive flowers or blooms

### 8.2.319 Sapindus drummondii

Western Soapherry

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 12 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hionli

drutta Sapindus drummondii is a deciduous Tree growing to 12 m (39ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf from April to October, in flower from May to June, and the seeds ripen in November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The seed is poisonous[1]. The fruit is poi-

kcakta Edible Parts: FruitEdible Uses: Fruit[105]. No more details from this report but another report says that it is poisonous[149]. The berry-like fruits have a leathery coat that contains poisonous saponins[229]. The fruit is about 15mm in diameter[200] and often hangs on the tree until the

tcanta Buttons Soap WoodA soap is obtained from the fruit by rubbing the fruit in water[1, 11, 95, 103]. Used in Mexico for washing clothes[227]. The fruit can be dried and stored for later use[169]. Buttons and necklaces are made from the seed[149]. Wood - heavy, strong and closegrained[82, 149]. It weighs 51lb per cubic foot[227]. It splits easily into thin strips and is often used in basket making, it is also used as a fuel[61, 82, 227, 229].

dwatta Antirheumatic Febrifuge Kidney PoulticeThe fruit is antirheumatic and febrifuge[149]. It is used in the treatment of kidney diseases [149, 227]. A poultice of the sap has been used to treat wounds[257].

nrakta South-western N. America - Kansas to Northern Mexico. ksacta Limestone bluffs, slopes and by streams[43], in moist clay or dry limestone[82]. Mexican valleys from the upper desert to the woodland zones[181].

propta Seed - requires some cold stratification. Pre-soak the seed for 24 hours in warm water and sow in a cold frame in mid-winter. Move to a greenhouse in early spring. The seed should germinate in late spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in early summer. Cuttings of almost ripe wood, 5 - 8cm with a heel, July/August in a frame. Fairly good percentage[78].

nwatta Succeeds in any well-drained soil in full sun[220]. This species tolerates a wide range of soils, including those that are dry, stony and nutrient deficient[200]. One report says that this species will probably not survive sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 8.2.310 Ophrys bombyliflora

7 tlin 10 cvuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ophrys bombyliflora is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe - Mediterranean. ksacta Not known

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being dormant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil

### 8.2.311 Lesquerella hybrids

Perennial Lesquerella

7 tlin 11 cyuc 2 kcak 4 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Lesquerella hybrids is a PERENNIAL growing to 0.6 m (2ft) by 0.8 m (2ft 7in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Carbon Farming Solutions - Staple Crop: oil (The term staple crop typically refers to a food that is eaten routinely and accounts for a dominant part of people's diets in a particular region of the world) [1-1].

tcanta The seed of some species yields up to 28% oil and 22% protein[269]. Average yields of 1.1 tonnes per hectare have been postulated and in small-scale experiments 1.6 tonnes has been attained[269]. The oil has possibilities in the manufacture of grease thickeners due to the hydroxyacid content. Major amounts of hydroxy-acids occur in the obscure seed oils, among them Lesguerella, but few of them have been subjected to development. According to Osman and Ahmad (1981), the only hydroxylated vegetable oil commercially available is castor oil. Other potential sources include Castalis, Coriaria, Dimorphotheca, Hiptage, and Osteospermum[269].

dwatta None Known

nrakta Origin: SW N. America. ksacta Warm temperate to subtropical

propta See individual species.

Standard New Perennial nwatta Management: Crop Staple Crop: Oil Under DevelopmentClimate: warm temperate to subtropical. Humidity: semi-arid. Carbon Farming Solutions - Cultivation: new crop as annual, perennials under development. Management: standard (Describes the non-destructive management systems that are used in cultivation) [1-1].

### 8.2.312 Asphodelus fistulosus

1419

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.6 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Asphodelus fistulosus is a ANNUAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves RootEdible Uses: Root cooked.[46, 61, 105] The root is fibrous according to one report[100] whilst another says that the swollen root has radi-

cal root fibres[42]. The plant is eaten as a vegetable, records of 'edible bulbs' seem to be erroneous[177].

dwatta Diuretic SkinThe seed is diuretic[240]. It is also applied externally to ulcers and inflamed parts of the body[240]. The seed contains oils rich in linoleic acid and are of value in preventing atherosclerosis[240].

nrakta S. Europe - Mediterranean. W. Asia. ksacta Dry sandy or rocky places[50] in fields, track-sides and uncultivated ground[89].

propta Seed - sow March/April in a greenhouse and only just cover the seed. Germination usually takes place in 1 - 3 months at 15°c[134]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. When the plants are large enough to handle, plant them out into their permanent positions in late spring or early summer. Division in early spring or autumn[111].

nwatta Succeeds in ordinary garden soil, tolerating partials shade[200]. Requires a well-drained soil. Prefers a deep rich sandy loamy soil[1, 42]. Prefers a sunny position in a soil that is not too rich[200]. Grows well on hot dry banks[42]. This species is often a short-lived perennial[270], though it is not very hardy in Britain. This has contributed to the mistaken belief that it is an annual. A covering of bracken overwinter is usually ample protection in most districts[42]. Asphodelus fistulosus has become a noxious weed in California and in other places with Mediterranean climates worldwide[270]. The flowers are sweetly scented[245]. Plants seem to be immune to the predations of rabbits[233].

### 8.2.313 Ophrys vernixia

7 tlin 10 cyuc 2 kcak 0 tcan 2 dwat 0.3 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ophrys vernixia is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Üses: Root - cooked. It is a source of 'salep', a fine white to yellowish-white powder that is obtained by drying the tuber and grinding it into a powder[200]. Salep is said to be very nutritious and is made into a drink or added to other cereals and used in bread etc[183]. One ounce of salep is said to be enough to sustain a person for a day[100, 115]. The salep can also be made into a drink[100].

dwatta Demulcent NutritiveSalep (see above for more details) is very nutritive and demulcent[4]. It has been used as a diet of special value for children and convalescents, being boiled with water, flavoured and prepared in the same way as arrowroot[4]. Rich in mucilage, it forms a soothing and demulcent jelly that is used in the treatment of irritations of the gastro-intestinal canal[4]. One part of salep to fifty parts of water is sufficient to make a jelly[4]. The tuber, from which salep is prepared, should be harvested as the plant dies down after flowering and setting seed[4].

nrakta Europe - Mediterranean. ksacta Not known

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. This species only rarely forms new offsets and so division is seldom feasible, the following methods can be tried, however[230]. Division of the tubers as the flowers fade[230]. This species produces a new tuber towards the end of its growing season. If this is removed from the plant as its flowers are fading, the shock to the plant can stimulate new tubers to be formed. The tuber should be treated as being domant, whilst the remaining plant should be encouraged to continue in growth in order to give it time to produce new tubers[230]. Division can also be carried out when the plant has a fully developed rosette of leaves but before it comes into flower[230]. The entire new growth is removed from the old tuber from which it has arisen and is potted up, the cut being made towards the bottom of the stem but leaving one or two roots still attached to the old tuber. This can often be done without digging up the plant. The old tuber should develop one or two new growths, whilst the new rosette should continue in growth and flower normally[230].

nwatta Plants can be grown in a lawn, but the lawn must not be cut until the plants have set seed[200]. Plants prefer a shady position[188]. Orchids are, in general, shallowrooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. This symbiotic relationship makes them very difficult to cultivate, though they will sometimes appear uninvited in a garden and will then thrive. Transplanting can damage the relationship and plants might also thrive for a few years and then disappear, suggesting that they might be short-lived perennials[230]. The flowers resemble a female insect and also emit a scent similar to female pheremones, they are pollinated by a male insect of that species attempting to copulate with the flower[200]. Tubers should be planted out whilst they are dormant, this is probably best done in the autumn[200]. They should be planted at least 5cm below soil level[200].

### 8.2.314 Eriogonum latifolium

Seaside Buckwheat

1420

hpa7tmwatli xre7t hjonli

7 tlin 10 cyuc 2 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis

drutta Eriogonum latifolium is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: StemEdible Uses: Young stems - raw[105]. Tender[161, 177]. Eaten by children in early summer[257]

dwatta Analgesic Ophthalmic StomachicA decoction of the root, stalk and leaves has been used in the treatment of headaches, stomach aches, coughs and colds[257]. A decoction of the roots has been used as a wash for sore eyes[257].

nrakta South-western N. America - California and Oregon. ksacta Sandy coastal flats, slopes, bluffs, and mesas, coastal scrub and grassland communities, from sea level to 80 metres, occasionally to 200 metres[270].

propta Seed - best sown as soon as it is ripe in the autumn in a sandy compost in a greenhouse. Sow stored seed in early spring in a warm greenhouse[1]. As soon as they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant out in late spring or early summer, after the last expected frosts. Division in early spring[1]. This has to be done with care because the plant resents root disturbance[200]. Try to obtain divisions from around the edges of the plants without digging up the whole clump. Tease the divisions out with as much root on them as possible and pot them up. Grow them on in light shade in the greenhouse until they are rooting well and plant them out in the summer. Cuttings of greenwood with a heel in the summer[200].

nwatta Requires a loose lean gritty well-drained soil in a very sunny position[200]. Succeeds in dry soils. Tolerates exposed positions[200]. Requires some protection from winter wet[1]. This species is not hardy in the colder areas of the

country, it tolerates temperatures down to between -5 and -10°c[200]. Established plants resent root disturbance[200].

### 8.2.315 Quercus falcata

Southern Red Oak, Cherrybark Oak, Spanish Oak, Southern Red Oak

7 tlin 9 cyuc 1 kcak 0 tcan 2 dwat 25 m hkuc

hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Quercus falcata is a deciduous Tree growing to 25 m (82ft 0in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in flower from April to May, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. The plant can tolerates strong winds but not maritime exposure.

kcakta Edible Parts: SeedEdible Uses: CoffeeSeed cooked. The seed is about 12mm long[227], it can be dried, ground into a powder and used as a thickening in stews etc or mixed with cereals for making bread. The seed contains bitter tannins, these can be leached out by thoroughly washing the seed in running water though many minerals will also be lost. Either the whole seed can be used or the seed can be dried and ground it into a powder. It can take several days or even weeks to properly leach whole seeds, one method was to wrap them in a cloth bag and place them in a stream. Leaching the powder is quicker. A simple taste test can tell when the tannin has been leached. The traditional method of preparing the seed was to bury it in boggy ground overwinter. The germinating seed was dug up in the spring when it would have lost most of its astringency. The roasted seed is a coffee substitute.

tcanta Repellent Tannin WoodA mulch of the leaves repels slugs, grubs etc, though fresh leaves should not be used as these can inhibit plant growth[20]. Oak galls are excrescences that are sometimes produced in great numbers on the tree and are caused by the activity of the larvae of different insects. The insects live inside these galls, obtaining their nutrient therein. When the insect pupates and leaves, the gall can be used as a rich source of tannin, that can also be used as a dyestuff[4]. The bark is a good source of tannin[82, 227]. Wood - coarse-grained, durable, heavy, hard, strong[43, 227, 229]. It cracks badly when left in the sun and rots when in contact with the soil[229]. It weighs 43lb per cubic foot[227]. It is not a prime timber, but is used for rough lumber, tools, furniture etc and as fuel[43, 227, 229].

dwatta Antiseptic Astringent Dysentery Febrifuge Salve TonicThe bark is antiseptic, astringent, febrifuge and tonic[82, 227, 257]. An infusion has been used in the treatment of chronic dysentery, indigestion, asthma, lost voice and intermittent fevers[257]. The bark has been chewed as a treatment for mouth sores[257]. An infusion of the bark has been used as a wash on sore, chapped skin[257]. Any galls produced on the tree are strongly astringent and can be used in the treatment of haemorrhages, chronic diarrhoea, dysentery etc[4].

nrakta Eastern N. America - New York to Florida, west to Texas. ksacta Dry sandy or clay upland soils, to 600 metres[229]. It is also occasionally found on moister fertile bottomlands or near streams, where it achieves its greatest size[43, 229].

propta Seed - it quickly loses viability if it is allowed to dry out. It can be stored moist and cool overwinter but is best sown as soon as it is ripe in an outdoor seed bed, though it must be protected from mice, squirrels etc. Small quantities of seed can be sown in deep pots in a cold frame. Plants produce a deep taproot and need to be planted out into their permanent positions as soon as possible, in fact seed sown in situ will produce the best trees[11]. Trees should not be left in a nursery bed for more than 2 growing seasons without being moved or they will transplant very badly.

nwatta Landscape Uses: Aggressive surface roots possible, Specimen, Street tree. Prefers a good deep fertile loam which can be on the stiff side[1, 11]. Young plants tolerate reasonable levels of side shade[200]. Tolerates moderate exposure, surviving well but being somewhat stunted[200]. A

moderately fast-growing tree in its native range, where it lives about 100 - 10 years[229]. It prefers warmer summers than are usually experienced in Britain, trees often grow poorly in this country and fail to properly ripen their wood resulting in frost damage overwinter[200]. Trees commence bearing seed when about 25 years old, production is cyclic with a year of high yields being followed by a few years of low yields[229]. The tree flowers on new growth produced in spring, the seed taking two summers to ripen[229]. Intolerant of root disturbance, trees should be planted in their permanent positions whilst young[11]. Hybridizes freely with other members of the genus[200]. Plants in this genus are notably resistant to honey fungus[200]. Special Features:Attracts birds, North American native, Attracts butterflies, Inconspicuous flowers or blooms.

### 8.2.316 Xylosma japonica

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 25 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Xylosma japonica is an evergreen Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

pcista The leaves contain a glycoside [179]. We are not sure if this means that it is poisonous[K].

kcakta Edible Parts: LeavesEdible Uses: Young shoots - cooked. A famine food, they are only used when all else fails[179]. The leaves contain a glycoside[179], see the notes above on toxicity.

tcanta Hedge HedgeTolerant of clipping, the plant can be grown as a formal hedge especially in areas cooler than its native range where it only develops into a shrub or small tree[200].

dwatta Oxytoxic PoulticeThe ashes of the stem bark are mixed with water and used to treat jaundice scrofula, sores, tumours etc[218]. They are also used to speed parturition[218].

nrakta E. Asia - China, Japan, Korea. ksacta Near seashores, C. and S. Japan[58]. Woodlands in Korea[109].

propta Seed - we have no information for this species but suggest sowing the seed in spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame[200].

mwatta Succeeds in full sun or light shade in most well-drained soils[200]. Tolerant of poor rocky soils[200]. Judging by the plants native habitat in Japan, it probably tolerates maritime exposure[K]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Even in the milder areas of the country it usually only makes a small tree or shrub[11].

### 8.2.317 Persea borbonia

Red Bay Sweethay

1421

7 tlin 11 cyuc 1 kcak 2 tcan 2 dwat 15 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Persea borbonia is an evergreen Tree growing to 15 m (49ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 9. It is in leaf all year, in flower from April to May, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil

kcakta Edible Parts: Edible Uses: CondimentThe fresh or dried leaves can be used as a flavouring in soups etc[229].

or with a heel, July/August in a frame. Good percentage[78].

nwatta Prefers a moist position and some shade[200]. Grows well in a rock garden[200]. Plants are not very hardy in Britain[11], but they succeed outdoors in the milder areas of the country[182].

# 8.2.374 Helenium puberulum

Rosilla

7 tlin 10 cvuc 1 kcak 0 tcan 1 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Helenium puberulum is a ANNUAL/PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Leaves and flowering heads - raw[257].

dwatta Antiscorbutic Poultice Sternutatory TonicAntiscorbutic, tonic. The dried powdered plant has been applied to wounds and has also been rubbed onto the forehead and nose in the treatment of colds[257]. It has been used as a snuff[257]. The plant has also been used in the treatment of venereal disease[257].

nrakta South-western N. America, ksacta Moist meadows, marshes, slough banks etc. below 600 metres in California[71].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer. If you have sufficient seed it would be worthwhile trying a sowing in situ outdoors in mid to late spring.

nwatta Grows well in ordinary garden soil[1, 111], succeeding in most conditions other than boggy soils[233]. It prefers a fertile moisture retentive soil[200] in a sunny position[108, 111]. Dislikes dry soil[200]. An annual or shortlived perennial, this species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants seem to be immune to the predations of rabbits[233]. A good bee and butterfly plant[30].

### 8.2.375 Sasa veitchii

Kuma-Zasa, Kuma bamboo grass

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Sasa veitchii is an evergreen Bamboo growing to 1.5 m (5ft) by 3 m (9ft). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots

tcanta Hedge HedgeA good medium high ground cover plant[200], it is a very good weed suppresser. Plants can be used as a low loose hedge[200].

nrakta E. Asia - Japan. ksacta Woodlands and damp hollows, C. and S. Japan[58, 200].

propta Seed - if possible, surface sow the seed as soon as it is ripe in a greenhouse at about 20°c. Stored seed is best sown as soon as it is received. Do not allow the compost to dry out. Germination usually takes place fairly quickly so long as the seed is of good quality, though it can take 3 -6 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a lightly shaded place in the greenhouse until large enough to plant out, which could be a few years. Plants only flower at intervals of several years and so seed is rarely available. Division in late spring as new growth commences. Take large divisions, trying to cause as little root disturbance to the main

clump as possible. Grow them on in light shade in a greenhouse in pots of a high fertility sandy medium. Mist the foliage regularly until plants are established. Plant them out into their permanent positions when a good root system has developed, which can take a year or more[200]. Divisions of less than 5 - 6 culms rarely succeed[200].

nwatta Requires a good humus rich loam with ample moisture in the growing season[200]. Prefers partial shade, growing well in thin woodland. A very hardy plant, tolerating temperatures down to about -22°c. The leaf margins are damaged by even light frosts, this gives a distinctive white margin to the leaves but does not otherwise damage the plant[195]. This species is notably resistant to honey fungus[200]. Plants only flower at intervals of many years. When they do come into flower most of the plants energies are directed into producing seed and consequently the plant is severely weakened. They sometimes die after flowering. but if left alone they will usually recover though they will look very poorly for a few years. If fed with artificial NPK fertilizers at this time the plants are more likely to die[122]. The rhizome is gently running. The plant is very invasive but fairly easy to control.

#### 8.2.376 Aristolochia debilis

Ma Dou Ling

7 tlin 10 cyuc 1 kcak 0 tcan 3 dwat 1 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aristolochia debilis is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August, and the seeds ripen from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

pcista We have no specific details for this species but most members of this genus have poisonous roots and stems[179]. The plant contains aristolochic acid, this has received rather mixed reports on its toxicity. According to one report aristolochic acid stimulates white blood cell activity and speeds the healing of wounds, but is also carcinogenic and damaging to the kidneys[254]. Another report says that it is an active antitumour agent but is too toxic for clinical use[218]. Another report says that aristolochic acid has anti-cancer properties and can be used in conjunction with chemotherapy and radiotherapy and that it also increases the cellular immunity and phagocytosis function of the phago-

kcakta Edible Parts: LeavesEdible Uses: Leaves cooked[177, 179]. It is said that the leaves of this species are not poisonous[179] but caution is advised.

dwatta Alterative Anodyne Antibacterial Antifungal Antiinflammatory Antitussive Carminative Cytotoxic Diuretic Expectorant Hypotensive Stomachic TonicAlterative, antibacterial, antifungal, diuretic[178]. Stimulates energy circulation[147]. The fruit and its capsule are antiasthmatic, antiseptic, antitussive and expectorant[176, 218]. It is used internally in the treatment of asthma and various other chest complaints, haemorrhoids and hypertension[238]. The root is anodyne and anti-inflammatory[238]. It is used internally in the treatment of snakebite, gastric disorders involving bloating, and is clinically effective against hypertension[218]. It is harvested in the autumn and dried for later use[238]. The whole plant is antitussive, carminative, stimulant and tonic[218]. The root contains aristolochic acid. This has anti-cancer properties and can be used in conjunction with chemotherapy and radiotherapy[176]. Aristolochic acid can also be used in the treatment of acute and serious infections such as TB, hepatitis, liver cirrhosis and infantile pneumonia[176]. It also increases the cellular immunity and phagocytosis function of the phagocytic cells[176]. Aristolochic acid is said to be too toxic for clinical use[218].

nrakta E. Asia - China, Japan ksacta Roadside thickets and meadows in lowland, C. and S. Japan and in China[58.

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Pre-soak stored seed for 48 hours in hand-hot water and surface sow in a greenhouse[134]. Germination usually takes place within  $1 \cdot 3$  months at  $20\,^{\circ} (134].$  Stored seed germinates better if it is given 3 months cold stratification at  $5\,^{\circ} (200].$  When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer after the last expected frosts. Division in autumn[200]. Root cuttings in winter[200].

nwatta Prefers a well-drained loamy soil, rich in organic matter, in sun or semi-shade[134, 200]. Succeeds in ordinary garden soil[134]. This species is not very hardy in Britain, tolerating temperatures down to about -5°c[238]. Most species in this genus have malodorous flowers that are pollinated by flies[200].

# 8.2.377 Helwingia chinensis

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 1.5 m hkuc pcimhmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Helwingia chinensis is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers moist soil.

kcakta Edible Parts: Flowers LeavesEdible Uses: The flowers and leaves might be edible[177].

dwatta SkinA decoction of the leaves and the bark are ingested for treating skin inflammations[218].

nrakta E. Asia - W. China. ksacta Thickets, 1300 - 2300 metres in W. Szechwan [109]. Mixed woods and thickets on slopes, broad-leaved forests, at elevations of 1000 - 2600 metres [266].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in late winter. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Succeeds in ordinary garden soil[1]. Requires a sheltered position beneath a good tree canopy cover[200]. Plants are not very hardy outdoors in Britain, only thriving in milder areas of the country where winter temperatures do not fall below about  $-7^{\circ}$ c[200]. The flowers are produced on the midribs of the leaves[200]. Dioecious, male and female plants must be grown if seed is required.

# 8.2.378 Helwingia japonica

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Helwingia japonica is a deciduous Shrub growing to  $1.5~\mathrm{m}$  (5ft) by  $1.5~\mathrm{m}$  (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to May, and the seeds ripen from August to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: Flowers Leaves Edible Uses: Young leaves - cooked with rice or boiled as a pother [1, 2, 179, 183]. The young flowers and young shoots are also eaten [105, 179, 183].

nrakta E. Asia - China, Japan. ksacta Woods and thickets in hills and low mountains of Japan[58]. Moist rich soil in woods, thickets, valleys, streamsides and roadsides at elevations of 100 - 3400 metres[266].

propta Seed - we have no information on this species but suggest sowing the seed in a greenhouse in late winter. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Succeeds in ordinary garden soil[1]. Requires a sheltered position beneath a good tree canopy cover[200]. Not very hardy in Britain, tolerating temperatures down to about -7°c, it only succeeds outdoors in the milder areas of the country[200]. Cultivated for its leaves in Japan[1]. The flowers are produced on the midribs of the leaves[200]. Dioecious, male and female plants must be grown if seed is required.

#### 8.2.379 Asparagus albus

7tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Asparagus albus is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: StemEdible Uses: Young shoots - cooked[46, 61, 177]. A poor substitute for the cultivated asparagus[2].

nrakta Europe - W. and C. Mediterranean. N. Africa. ksacta High plateaux in hedges and scrub[46, 50].

propta Seed - pre-soak for 12 hours in warm water and then sow in spring or as soon as the seed is ripe in early aumn in a greenhouse. It usually germinates in 3- 6 weeks at  $25^{\circ}c[134]$ . Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a sunny position in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer[K]. Division in early spring as the plant comes into growth.

nwatta Easily grown in any good garden soil[200]. Prefers a rich sandy loam[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. The edible young shoots of this plant are sold in local markets in the Mediterranean area[46, 61]. Unlike most members of this genus, this species has hermanhrodite flowers

# 8.2.380 Bidens aurea

Arizona beggarticks

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 1 m hkuc

htut cyutlı tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Bidens aurea is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from September to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: Edible Uses: TeaThe leaves are possibly used as a tea substitute[177].

nrakta Southern N. America from Mexico south to Guatemala in Central America. ksacta Marshy fields[260].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in the spring. Surface-sow or only just cover the seed and do not allow the compost to dry out. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring.

dwatta Febrifuge Styptic Tonic UrinaryThe roots, stems and leaves are febrifuge, styptic and tonic. Strengthens bones and muscles[147]. A decoction of the root, stems or leaves is used in the treatment of abdominal cramps, amenorrhoea, diarrhoea, myalgia, traumatic injuries and urinary stones[147, 218].

nrakta E. Asia - Japan - Kuroshima, Suwanose, and Uji Islands. ksacta An understory plant, found growing in forests beneath Ardisia crenata and Castanopsis sieboldii[266].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter in the greenhouse. Plant them out in late spring or early summer after the last expected frosts. Division as the plant

comes into growth in the spring[200]. Suckers. Best removed in the autumn and grown on in the greenhouse for the first winter.

nwatta Landscape Uses:Border, Container, Foundation, Ground cover, Massing, Specimen, Woodland garden. Prefers a shady position in a rich well-drained soil[200]. Tolerates poor soils and drought[200]. Almost hardy in Britain[1], plants can withstand temperatures down to about -15°c if they are well sited[200]. A plant growing under shrubs in Worcestershire has survived in the garden for over 30 years[233]. This plant used to be commonly grown as a house plant, it tolerates considerable neglect[200]. Special Features:Attractive foliage, Not North American native, Inconspicuous flowers or blooms.

nwatta Succeeds in any moderately fertile moisture-retentive soil in full sun[200]. Prefers a good well-drained soil[260]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10 $^{\circ}$ c[200].

#### 8.2.381 Tamarix canariensis

Tamarisk, Canary Island tamarisk

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwissliphsom hpa7tmwatli xre7t hionli

drutta Tamarix canariensis is a deciduous Tree at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline and saline soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

kcakta Edible Parts: MannaEdible Uses: A sweet manna-like substance that exudes from the stems is collected and mixed with flour, sugar and almonds, formed into cakes and baked as a sweetmeat[183].

tcanta Hedge HedgeVery tolerant of maritime exposure, it makes a good shelter hedge in coastal gardens.

nrakta Europe - Mediterranean. Canary Isles. ksacta Not known

propta Seed - sow spring in a cold frame and only just cover the seed. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Very easy[200]. Cuttings of mature wood of the current seasons growth, 15 - 25cm long, planted outdoors in late autumn in a nursery bed or straight into their permanent position. High percentage[11, 200].

nwatta An easily grown plant, succeeding in most soils and tolerant of saline conditions[11]. Grows well in heavy clay soils as well as in sands and even shingle[182]. Usually found near the coast, it succeeds inland if given a fairly good deep loam and a sunny position[11, 200]. Tolerant of maritime winds and dry soils when grown near the coast[11], plants require a moister soil and shelter from cold drying winds when they are grown inland in non-saline soils because they use the soil salts that are found in saline soils to help them reduce transpiration[200]. This species is not very hardy outdoors in Britain[1], but it succeed in the milder areas of the country, tolerating temperatures down to between -5 and -10°c[200]. Growth can be restricted by cutting back the plants in spring, hedges are also best trimmed at this time[188]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.382 Celastrus dependens

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Celastrus dependens is a deciduous Climber. See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Édible Parts: Flowers OilEdible Uses: OilThe young flowers are used as a vegetable [183].

tcanta OilThe seed contains 52% oil, and the fruit 30%[240]. This oil is used medicinally (see notes above), we do not know if it has any other applications[K].

dwatta Abortifacient Analgesic Antidote Aphrodisiac Bitter Cancer Diaphoretic Emetic Emmenagogue Laxative Leprosy Stimulant TonicThe plant is used as an antidote to opium[218]. It is also considered to be analgesic, aphrodisiac, diaphoretic, emetic, emmenagogue, stimulant and tonic[218]. The bark is abortifacient[240]. The juice from the

bark is used in the treatment of indigestion[272]. The seed is aphrodisiac, bitter, emetic, laxative and stimulant[240]. It is used in the treatment of rheumatism, leprosy, gout, fevers and paralysis[240, 272]. The oil from the seed is a powerful stimulant. It is used in the treatment of beriberi[240]. Many plants in this genus contain compounds of interest for their antitumour activity[218].

nrakta E. Asia - S.W. China to the Himalayas. ksacta Open moist places to elevations of 300 metres in Nepal[272].

propta Seed - gather when ripe, store in dry sand and sow February in a warm greenhouse[78]. Three months cold stratification leads to a higher germination rate[113]. Remove the aril since this inhibits germination[113]. Germination rates are usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in a greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Layering in August of the current seasons growth. Takes 12 months[78]. Root cuttings, 6mm thick 25mm long in December. Plant horizontally in pots in a frame[78].

nwatta Prefers a deep loamy soil[11]. A gross feeder, it requires a rich soil[11]. This species is not hardy in the toolder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. A rampant climber, it requires ample space and is best grown into an old tree[1, 200]. Fruits best when its top growth is in a sunny position[182]. Plants climb by means of twining and by hooked prickles[182]. They do not normally require pruning[219]. This species is closely related to C. scandens[200]. Dioecious, male and female plants must be grown if seed is required.

## 8.2.383 Albuca major

Slime Lilv

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Albuca major is a BULB growing to 0.5 m (1ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in April. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: StemEdible Uses: The succulent stems are chewed to allay thirst[177]. They are rather mucilaginous[2].

nrakta S. Africa. ksacta Sandy places on flats and lower slopes[73].

propta Seed - we have no details for this species but suggest sowing the seed in a greenhouse in a light well-drained compost as soon as it is ripe if possible, otherwise in spring. Sow the seed thinly so that the young plants can be grown on in the same pot for their first year of growth. Apply a liquid feed from time to time if the seedlings look as though they need nutrients and prick them out at the end of their first growing season. Grow on the plants for at least their next winter in a greenhouse and plant out when the bulbs are dormant in late summer or early autumn. Division of offsets in late summer

nwatta Requires a sheltered position in full sun in a light well-drained soil[200]. Succeeds outdoors in areas where frosts are short-lived and light, to a minimum of  $-5^\circ$ , and in such areas grow well in a wild or informal garden[200]. It is best to give the bulbs some protection in the winter, preferably using a cloche or pane of glass[1]. This species is closely related to A canadensis and included in that species by some botanists[73, 200].

#### 8.2.384 Cheilanthes pteridioides

Ressurection Fern

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Cheilanthes pteridioides is an evergreen Fern growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species

is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although we have found no reports of toxicity for this species, a number of ferns contain carcinogens so some caution is advisable[200]. Many ferns also contain thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people eating an adequate diet that is rich in vitamin B, though large quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172].

kcakta Edible Parts: Edible Uses: TeaThe plant is said to be used as a tea substitute[183].

nrakta S. Europe. ksacta Grows amongst stones[245].

propta Spores - best surface sown as soon as they are ripe in a greenhouse and do not allow the compost to dry out. Placing the pot in a plastic bag helps to maintain a humid atmosphere which promotes germination and growth. Prick out small clumps into pots when they are large enough to handle and keep moist until established. Grow on in a greenhouse for at least the first winter and plant out in late spring.

nwatta Difficult to grow in the garden, requiring part shade (but full sun in the winter in temperate regions), low humidity and infrequent waterings[200]. It requires a very well-drained soil with some lime[200]. One report says that the plant is hardy to zone 8, tolerating temperatures down to about -5° c and therefore succeeding outdoors in the mildest parts of Britain[200]. However, another report says that the plants require a minimum winter temperature of 10°c[245]. The foliage shrivels and appears to be dead during prolonged periods of drought, rehydrating when the rain returns[200]. The bruised, and especially the dried, foliage has a scent of newly mown hay due to the presence of coumarin[245]. Members of this genus are rarely if ever troubled by browsing deer[233].

### 8.2.385 Salvia mellifera

Californian Black Sage

7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat m hkuc

htut cyutİi kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia mellifera is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: SeedEdible Uses: Condiment TeaThe aromatic leaves can be brewed into a tea[183]. The leaves and stems can be used as a food flavouring[183, 257]. The seeds can be dried then ground into a powder and used as a gruel[257].

dwatta Analgesic Cardiac Carminative PectoralThe green leaves are cardiac and carminative[257]. An infusion has been used in the treatment of heart complaints[257]. They can be chewed in the treatment of gas pains[257]. A poultice of the heated leaves can be applied to the ear in the treatment of ear pains, or to the neck in the treatment of sore throats[257]. A decoction of the plant has been used in the treatment of chronic bronchial coughs[257]. The decoction has also been used as a bath in the treatment of paralysis[257].

nrakta South-western N. America - California. ksacta Found in coastal sage scrub and chaparral plant communities[276].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. Soils rich in nitrogen encourage excessive leaf growth at the expense of flowering[11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between 5 and -10°c[200]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.386 Salvia multicaulis

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat m hkuc

htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia multicaulis is an evergreen Shrub growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: Condiment TeaThe plant is used as a condiment for tea or is prepared as a tea in boiling water[183]. The aromatic leaves are a good substitute for common sage (Salvia officinalis) in cooking[187].

nrakta W. Asia - Iran to Turkey. ksacta Dry scrub, steppe and rocky limestone slopes to 2600 metres[187].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained fertile sandy soil in a sunny position[200]. Soils rich in nitrogen encourage excessive leaf growth at the expense of flowering[11]. Hardy to about -25°c[187]. Another report says that the plant only tolerates temperatures down to about -10°c[200]. Plants can be killed by excessive winter wet. A low-growing plant forming mats[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.387 Corema album

Portuguese Crowberry

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli frusflat hpa7tmwatli nyanhjen hjonli

drutta Corema album is an evergreen Shrub growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid soils and can grow in very acid soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit - raw or cooked[200].

nrakta S. W. Europe - Portugal and Spain. ksacta Maritime sands and dunes on the Atlantic littoral.

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed requires 5 months warm stratification followed by 3 months at 5°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Cuttings of mature wood of the current year's growth, November in a frame.

nwatta Requires a light or medium lime-free soil[11, 182], succeeding in full sun or light shade[182]. Plants are growing very well in a sandy peat in a garden near London[11]. This species is not hardy in the colder areas of the

on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at  $20^{\circ}\mathrm{c}$  followed by 12 - 14 weeks at  $3^{\circ}\mathrm{c}$ . Germination may still take another 12 months or more at  $15^{\circ}\mathrm{c}[164]$ . Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame.

nwatta Prefers a cool lime-free well-drained sandy loam and a sunny position[1, 11]. Succeeds in neutral soils[11] and tolerates partial shade[200]. Likes plenty of moisture in the growing season[11]. A good sandy loam and a sunny position suits most members of this genus[11]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Closely related to D. bholua[11]. The flowers are fragrant[272]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188].

# 8.2.481 Garrya elliptica

Coast Silk Tassel, Wavyleaf silktassel 7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 4 m hkuc pcimhmimhtut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhien hjonli

drutta Garrya elliptica is an evergreen Shrub growing to 4 m (13ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from November to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure. It can tolerate atmospheric pollution.

tcanta Dye Hedge Hedge Repellent WoodGrows well by the sea and can be grown as a hedge in the milder parts of Britain[29, 166]. A hedge in a sheltered position at Wisley in 1991 was very healthy[K]. Makes a good wind shelter[166]. Grey to black dyes are obtained from the berries. The colour varies according to the ripeness of the fruit, green fruits are the best[168]. The bark and leaves are very bitter, a possible insect repellent?[K]. Wood - hard, close-grained. It has been used for fine cabinet work, though its small size and rarity limits its commercial usefulness[229].

dwatta Abortifacient Antiperiodic FebrifugeThe leaves are intensely bitter and are used as an antiperiodic and febrifuge. They can be used as a quinine substitute[46, 61, 95]. An infusion has been used to induce menstruation, probably acting as an abortifacient[257].

nrakta South-western N. America - California to Oregon. ksacta Chaparral and forest on dry slopes and ridges below 600 metres[71, 184].

propta Seed - best sown as soon as it is ripe in a cold frame. Very slow, the seed can take 2 or more years to germinate. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10 cm with a heel, August in a frame[200]. Cuttings of mature wood 10 - 12 cm with a heel, December/January in a frame[200].

nwatta Prefers a sunny position succeeding in most well-drained fertile soils[182, 200, 202]. Succeeds in a hot dry position. Succeeds in light shade[202], the plants are also tolerant of quite deep shade[219]. Does not require a rich soil or abundant moisture[11], if the soil is too fertile the flowering will be delayed[200]. Plants are resistant to urban pollution and maritime exposure, but they are subject to wind scorch from cold drying winds in colder areas[184]. This species is hardy to about -15°c[184], it is best on a sunny wall in most parts of the country but does very well as a free standing shrub in Devon and Cornwall[11]. In cold winters and springs the previous year's leaves may fall before the new

leaves are produced[202]. A hedge in a relatively open area at Wisley in Surrey is growing well (1991), as is a plant in a friend's garden in Stockton on Teesside(1998)[K]. All pruning should be carried out in spring before new growth starts but after flowering has ended[1]. Plants are strongly resentful of root disturbance[1, 11], they should be planted into their permanent positions as soon as possible. Dioecious. Male and female plants must be grown if seed is required.

## 8.2.482 Spigelia marilandica

Indian Pink, Woodland pinkroot

7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat m hkuc

hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Spigelia marilandica is a PERENNIAL growing to 0.5 m (1ft 8in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista This plant is poisonous in large quantities[21]. dwatta Anthelmintic NarcoticThe whole plant, but especially the root, is anthelmintic and narcotic[4, 21, 46]. A safe and effective anthelmintic when used in the proper dosage, it is especially effective with tapeworms and roundworm[4]. Its use should always be followed by a saline aperient such as magnesium sulphate otherwise unpleasant side effects will follow[4]. Another report says that it can be used with other herbs such as Foeniculum vulgare or Cassia senna[254]. These will ensure that the root is expelled along with the worms since the root is potentially toxic if it is absorbed through the gut[254]. The root is best used when fresh but can be harvested in the autumn then dried and stored[213]. It should not be stored for longer than 2 years[213]. Use with caution and only under professional supervision[21, 254]. The plant contains the alkaloid spigiline, which is largely responsible for the medicinal action but side effects of an overdose can include increased heart action, vertigo, convulsions and possibly death[222, 274].

nrakta South-eastern N. America - New Jersey to Florida. ksacta Rich dry soils on the edges of woods[4, 43].

propta Seed - requires stratification, pre-chill for 3 weeks prior to sowing. It will usually germinate in 1- 3 months at  $20^{\circ}\mathrm{c}.$  Prick out the seedlings into individual pots once they are large enough to handle and grow on in a cold frame for their first winter. Plant out in late spring or early summer. Division in the spring. Basal cuttings in late spring. Harvest the shoots with plenty of underground stem when they are about 8-  $10\mathrm{cm}$  above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Succeeds in most fertile soils in semi-shade[200]. Tolerates full sun if the soil remains reliably moist in the growing season[200], in a shady position it tolerates considerably drier soils[4]. Plants are hardy to about -15°c[200]. A very ornamental plant[1].

### 8.2.483 Aspidistra elatior

Aspidistra, Cast Iron Plant

7 tlin 11 cyuc 0 kcak 0 tcan 2 dwat 0.6 m hkuc

pcimhmim cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Aspidistra elatior is an evergreen Perennial growing to 0.6 m (2ft) by 0.5 m (1ft 8in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Slugs, snails. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) or semi-shade (light woodland). It prefers dry or moist soil and can tolerate drouotht.

tcanta Aspidistras can be grown as a ground cover in a shady position [188].

frost when they might wait until April. Frost just before flowering or at the time of flowering kills the pollen[185]. New growth takes place from May until the end of September and can be very vigorous, 1.2 metres a year is not uncommon and this can be maintained for 30 years or more[185]. The best trees are found in Devon, Wiltshire, Perthshire and Ireland[185]. The crushed foliage has the scent of candle wax[185]. Special Features: Attracts birds, North American native. Inconspicuous flowers or blooms. Carbon Farming -Climate: warm temperate to subtropical, tropical highlands. Humidity: humid. Cultivation: minor global crop. Management: coppice.

# 8.2.478 Delphinium staphisagria

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc

htut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Delphinium staphisagria is a BIEN-NIAL/PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant contain diterpene alkaloids and are highly toxic[4, 148, 238]. The plant is most toxic when it is young[200]. Ingestion of a lethal dose produces a feeling of excitement, followed by depression and extreme sensitivity of the nerves, followed by paralysis, a slowing of the pulse and finally death by asphyxia[232].

tcanta Insecticide Parasiticide Parasiticide is obtained from the leaves[172]. It is quite toxic and so is for external use only. The seed is used to make a potent insecticide, parasiticide and to destroy vermin[4, 61, 89, 100, 238]. It is used to kill head lice[238].

dwatta Antispasmodic Cathartic Emetic Homeopathy Odontalgic Parasiticide Sialagogue Vermifuge WartsStavesacre is a very poisonous plant that is rarely used in modern herbal medicine[238]. The seed is antispasmodic, cathartic, emetic and vermifuge[4, 44]. The seeds cause a strong salivation if they are chewed and have been used in the treatment of toothache and other painful conditions of the throat and gums[232]. They are so strongly emetic and cathartic, however, that they are rarely used internally[4]. Externally, a decoction is used to treat itchy skin and parasites4]. The seed is very poisonous and should be used with great caution[4]. The plant has been used externally in the treatment of warts, lice and itches[232]. A homeopathic remedy is made from the seeds[232]. This is used in the treatment of a variety of ailments including toothache, injuries and headache[232].

nrakta Europe - Mediterranean. ksacta Field verges and in scrub, on hot dry soils[89]. Often found in poor soils[232]. propta Seed - sow March in a cold frame or April outdoors. Keep moist and in a shady position until germination takes place[175]. Seed can also be sown either in a

cold frame or in situ as soon as it is ripe in mid to late summer[175], though seedlings from the outdoor sowing can be killed in cold winters[K]. The seed has a limited viability so it should be stored in a sealed container at about 3°c[200]. Temperatures above 15°c inhibit germination[175]. The seed usually germinates in 2 - 9 weeks at 15°c[175].

nwatta Succeeds in most soils and situations[4] but prefers a rich well-drained neutral to alkaline soil[4, 200, 238] and is intolerant of winter-wet soils[200]. Requires an open sunny position[188]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. A greedy plant, inhibiting the growth of nearby plants, especially legumes[54].

# 8.2.479 Boenninghausenia albiflora

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc htut cyutli tcup hwicli hrasilut hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Boenninghausenia albiflora is a deciduous Shrub growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil

tcanta Essential Parasiticide RepellentThe plant contains 0.2 - 0.4% essential oils[272]. The dried leaves are used as a flea repellent[272].

dwatta Anodyne Malaria Parasiticide StypticThe leaves are pounded and applied to cuts and wounds as a styptic and to speed the healing process[218, 272]. They are crushed and placed in the nostrils in the treatment of malaria[218]. The external application of the leaves is also used in the treatment of scabies[272]. The leaf juice is dropped into wounds in order to kill germs[272]. Applied externally to the forehead, the juice is said to relieve headaches, whilst the whole plant is placed under the pillow whilst sleeping to relieve headaches[272]. A decoction of the root is used in the treatment of malaria[218].

nrakta E. Asia - Himalayas to Japan. ksacta Forests and shrubberies to 3300 metres in the Himalayas[51]. Generally found in moist places in Nepal at elevations of 500 - 3000 metres[272].

propta Seed - best sown as soon as it is ripe in a greenhouse in the autumn[188]. Sow stored seed in February to May in a greenhouse[138]. Only just cover the seed. Germination usually takes place within 1 - 3 months at 15°c[138]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a

nwatta Requires a warm sheltered position in a welldrained soil that is not too dry[11, 138, 200]. Plants are likely to rot if the soil remains too wet in winter[200]. Succeeds on chalk[11, 182]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants are often cut to the ground in severe winters but they usually regrow from the base[11, 182]. It is best to give the roots a mulch in the winter[11]. A very ornamental but short-lived plant[1]. The leaves are very aromatic[188].

#### 8.2.480 Daphne papyracea

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkuc hmim cyutli tcup hwicli jlutnyik hpa7tli flatpriklwis hna7tmwatli xre7t hionli

drutta Daphne papyracea is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

pcista All parts of the plant are poisonous[76, 200]. Skin contact with the sap can cause dermatitis in some people [65,

tcanta PaperThe inner bark is used in the manufacture of, or as a paper[1, 11, 158, 171]. It is one of the principle sources of Nepalese hand-made paper[272].

dwatta Bitter Febrifuge PurgativeThe plant is bitter, febrifuge and purgative[240, 243]. The reports do not say which part of the plant is used.

nrakta E. Asia - Himalayas from Pakistan to C. Nepal.. ksacta Forests, 1200 - 2800 metres[158]. Shaded places in forested areas at elevations of 1500 - 3200 metres in Nepal[272].

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries

country, it tolerates temperatures down to between -5 and - 8.2.390 Dryopteris sieboldii 10°c[200]. Dioecious, male and female plants must be grown if seed and fruit is required[182].

## 8.2.388 Incarvillea delavayi

Hardy Gloxinia

7 tlin 9 cvuc 1 kcak 0 tcan 0 dwat 0.4 m hkuc

hmimhtut cyutli hgattcup hwicli hrasjlut hpa7tli priklwis hpa7tmwatli xre7t hjonli

drutta Incarvillea delavayi is a PERENNIAL growing to 0.4 m (1ft 4in) by 0.3 m (1ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH; neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil and can tolerate drought.

pcista One report suggests that the plant might be slightly toxic[179].

kcakta Edible Parts: LeavesEdible Uses: Leaves and young shoots - cooked. A famine food, it is only used when all else fails[179]. Some caution is advised, see the notes above on toxicity.

nrakta E. Asia - S.W. China in Yunnan. ksacta Grassy places and scrub around 2000 metres[187]. Pastures and open grassland, 2400 - 3500 metres, but it is now uncommon in its native range[200].

propta Seed - sow autumn or spring in a greenhouse Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow on for at least their first winter in a greenhouse and plant out into their permanent positions in spring after the last expected frosts. Division with care in early spring or autumn.

nwatta Landscape Uses:Alpine garden, Border, Container, Rock garden, Specimen. Easily grown in a deep sandy but rich soil in full sun[187, 200]. Plants grow better if given some shade around midday[200]. Prefers a well-drained calcareous or neutral soil[214] and is drought tolerant when established[190]. Another report says that it dislikes dry summer soils[200]. Dislikes winter wet[200]. Prefers a sheltered position[214]. Plants are hardy to about -15°c, tolerating even lower temperatures if the roots are well mulched, preferably with dry bracken[1, 187, 200]. The crown of the plant requires protection from slugs in the winter[187]. A very ornamental plant, it usually takes about 3 - 4 years to come into flower from seed[214]. This species is often confused in cultivation with I. mairei[214]. Plants are intolerant of root disturbance, it is best to place them in their permanent positions whilst small[200]. The plants will often sulk for several years if they are divided[214]. Special Features: Attractive foliage

## 8.2.389 Digitaria ciliaris

Southern Crab Grass, Southern crabgrass 7 tlin 10 cvuc 1 kcak 2 tcan 0 dwat 0.6 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Digitaria ciliaris is a ANNUAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta One report says the plant is edible but does not specify which part[145]. A wild millet grass with possibly edible seeds [1b].

tcanta FodderFodder/animal feed, Forage. Environmental: Agroforestry, Soil conservation. D. ciliaris cv. Red River is a high-yielding forage and conservation-type cultivar developed and released in 1988 [1d].

nrakta Cosmopolitan in warmer areas of the world. ksacta Waste ground and cultivated fields all over Japan[58]. propta Seed

nwatta A polymorphic species[58].

7 tlin 10 cvuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc hmim cyutli hgattcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli hjonli

drutta Dryopteris sieboldii is a FERN growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland). It prefers moist soil and can tolerate drought.

pcista Although we have found no reports for this species, a number of ferns contain carcinogens so some caution is advisable[200]. The fresh plant contains thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people eating an adequate diet that is rich in vitamin B, though large quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172]. However, there have been reports for other species of ferns suggesting that even cooked fronds can have a long term harmful effect. Some caution is therefore advised

kcakta Edible Parts: RootEdible Uses: Root - dried and ground into a powder[177]. Some caution is advised, see the notes above on toxicity.

nrakta E. Asia - S. China, Japan. ksacta Woods, C. and S. [apan[58]. On the rather dry floor of mountain forests[275].

propta Spores - can be sown at any time of the year in a greenhouse. Surface sow on a sterilised compost and keep moist, possibly by placing the pot in a plastic bag. Germinates in 1 - 3 months at 20°c. Pot up small clumps of the plants when they are large enough to handle and grow on in a shady part of the greenhouse until large enough to plant out. Division in spring. Larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers an acid to neutral soil, succeeding in ordinary fertile soil in a shady position. Prefers a moist soil[188], but plants are drought tolerant when established[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It is best grown in a greenhouse in many parts of Britain[1]. A very ornamental plant[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.391 Sapindus marginatus

Wingleaf soapberry

7 tlin 10 cvuc 1 kcak 0 tcan 0 dwat m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasilutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Sapindus marginatus is a deciduous Tree growing to 15 m (49ft 3in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf from April to October, in flower from May to June, and the seeds ripen in November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista The seed is poisonous[1]. The fruit is poi sonous[149]

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177]. The fruit is eaten by native North American Indians, though most white people find it repulsive[105].

tcanta Soap WoodA soap is obtained from the fruit by rubbing the fruit in water[46]. Used in Mexico for washing clothes[227]. The fruit can be dried and stored for later use[169]. Wood - heavy, strong, close-grained, splits easily[46, 72]. It splits easily into thin strips and is often used in basket making [46].

nrakta South-western N. America - Florida, Georgia and South Carolina, ksacta Hammocks near the coast[72].

propta Seed - requires some cold stratification. Pre-soak the seed for 24 hours in warm water and sow in a cold frame in mid-winter. Move to a greenhouse in early spring. The seed should germinate in late spring. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse for at least their first winter. Plant out in early summer. Cuttings of almost ripe wood, 5 - 8cm with a heel, July/August in a frame. Fairly good percentage[78].

nwatta We have very little information on this species and do not know if it will be hardy outdoors in Britain, though judging by its native range it could succeed outdoors at least in the mildest areas of the country. The following notes are based on the general needs of the genus. Succeeds in any well-drained soil in full sun[220]. This species tolerates a wide range of soils, including those that are dry, stony and nutrient deficient[200]. Trees are relatively slow-growing in the wild[229].

#### 8.2.392 Mirabilis multiflora

Four O'clock Plant, Colorado four o'clock 7 tlin 10 cyuc 1 kcak 0 tcan 2 dwat m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Mirabilis multiflora is a PERENNIAL growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil

kcakta The dried root can be ground into a powder, mixed with cereal flours and used to make a bread[257]. This bread is eaten to reduce the appetite[257].

dwatta Hallucinogenic Poultice StomachicThe root is used in the treatment of stomach complaints[192]. A pinch of the powdered root is said to relieve hunger[207], it can also be used after overeating to relieve the discomfort[257]. A poultice of the powdered root can be applied to swellings[257]. Large quantities of the root are said to cause intoxication[192]. The root was chewed by native North American Medicine men to induce visions whilst making a diagnosis[257].

nrakta Southern N. America - Texas to Colorado and Utah. ksacta Hillsides and mesas, often amongst rocks and shrubs[192]. Gravelly or sandy soils, pinyon-juniper woodlands, ponderosa pine forests at elevations of 300 - 2300 metres[270].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer, after the last expected frosts. The seed remains viable for several years[196]. Division in spring as the plant comes into growth[200].

nwatta Requires a fertile well-drained soil in full sun or part-day shade[200]. Plants flower in their first year from seed and, although they are not very hardy in Britain, tolerating temperatures down to about -10°c when in a suitable situation[260], they can either be grown as half-hardy annuals or the tubers can be harvested in the autumn and stored overwinter in a cool frost-free place in much the same manner as dahlias[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.393 Salvia japonica

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.8 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Salvia japonica is a PERENNIAL growing to 0.8 m (2ft 7in) by 8 m (26ft). See above for USDA hardiness. It hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers dry or moist soil

kcakta Edible Parts: FlowersEdible Uses: Children suck the flowers (for the sweet nectar?)[177, 183]. The leaves are used as a flavouring, they are a sage substitute[179].

tcanta A black dye is obtained from the plant, probably from the flowers[178].

nrakta E. Asia - China, Japan, Korea.. ksacta Woods and thickets in hills and mountains, C. and S. Japan[58].

propta Seed - sow March/April in a greenhouse[200]. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year. Cuttings of half-ripe wood succeed at almost any time in the growing season[200].

nwatta Requires a very well-drained light sandy soil in a sunny position[200]. Prefers a rich soil[1]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants can be killed by excessive winter wet[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

#### 8.2.394 Bulbinella hookeri

Maori Onion

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.7 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlut hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Bulbinella hookeri is a BULB growing to 0.7 m (2ft 4in) by 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: RootEdible Uses: Root - fleshy[173, 187] No further details are given

nrakta New Zealand. ksacta Northern slopes and damp places from lowland to sub-alpine pastures on North and South Islands south to latitude 42° south[44].

propta Seed - best sown in a cold frame as soon as it is ripe. Sow stored seed in a greenhouse as early in the year as possible. The seed usually germinates in 1 - 3 months at 13°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first two winters, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the spring. Best done as the plants come into growth. Pot the divisions up and grow them on in a cold frame until they are established then plant them out in the summer.

nwatta An easily grown plant so long as it is in a moist peaty neutral or slightly acidic soil[42, 200, 233], but it also succeeds on dry hillsides[42, 200]. Shade tolerant[1]. Plants only succeed outdoors in the mildest areas of Britain, they are hardy to about -5°c[187], tolerating light short-lived frosts[200]. A plant is growing in the rock garden at Cambridge Botanical Gardens. It is in an open position but does not receive a lot of direct sunlight[K]. This species is becoming much more common in the wild because it is not eaten by grazing animals nor is it killed by burning[187].

#### 8.2.395 Argemone mexicana

Prickly Poppy, Mexican pricklypoppy 7 tlin 10 cyuc 1 kcak 2 tcan 3 dwat m hkuc htut cyutli hgatkyuctcup hwicli hyishras hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Argemone mexicana is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs). The plant is self-fertile. Suitable for: light (sandy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

plains, valleys and foothills[212]. Open or disturbed sites in Texas, often on calcareous soils[274].

propta Seed - sow spring in a greenhouse and only just cover the seed. Prick the plants out into individual pots as soon as they are large enough to handle, using deep pots to accommodate the tap root. Grow on for the first winter in a greenhouse and plant out into their permanent positions in late spring or early summer[200]. Cuttings of half-ripe wood, July/August in a frame.

nwatta Requires a position in full sun in a deep open well-drained soil[200]. Often found in calcareous soils in the wild[274]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Plants are sub-shrubs and may die back to the base in winter[200]. Plants have deep taproots and resent root disturbance[200]. They should be planted into their permanent positions as soon as possible. Because it is unpalatable to livestock, this plant is often an indicator of overgrazed land[274]. Plants are strongly aromatic[200].

# 8.2.476 Loropetalum chinense

Fringe Flower, Chinese Fringe Bush 7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Loropetalum chinense is an evergreen Tree growing to 2 m (6ft) by 1.2 m (4ft in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 9. It is in leaf all year, in flower from February to April, and the seeds ripen from May to July. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Depurative Dysentery Haemostatic PectoralThe whole plant is depurative, haemostatic and pectoral[147]. A decoction is used in the treatment of coughing in tuberculosis, dysentery, enteritis etc[147, 218]. The leaves can be crushed and pulverised for external application on wounds[147].

nrakta E. Asia - Himalayas to China and Japan. ksacta Rocky hills and dry open woods, often on limestone[184, 260]. Stream banks, hilly slopes and roadsides[147].

propta Seed - sow in a warm greenhouse in late winter or early spring[188]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Give the plants some protection from the cold for at least their first winter outdoors. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame[200]. Fair to good percentage[78]. Layering in the spring[188].

nwatta Landscape Uses:Border, Screen, Standard, Superior hedge, Specimen. Requires a rich well-drained neutral to acid soil in full sun or light shade[188]. Requires a lime-free humus-rich soil[182]. One report says that it succeeds on a sheltered north wall[182] whilst another says that it needs a sunny position[219] and another says it needs warm summers[260]. Prefers a cool root run[182]. This species is not very cold-hardy in Britain, it is also slow growing[184]. It succeeds outdoors in the mildest areas of the country, tolerating temperatures down to about -5°c[184]. Plants do not flower well if the temperature drops below 5°c[200]. The Japanese form of this species might be hardier[11]. Plants grow taller in their native habitat, reaching a height of 3 metres[200]. The flowers emit a delicate sweet perfume[245]. Some named forms have been developed in Japan for their ornamental value[182]. Special Features: Attractive foliage, Not North American native, Fragrant flowers. Attractive flowers or blooms.

#### 8.2.477 Seguoia sempervirens

Coastal Redwood, Redwood, California Redwood, Coast Redwood

7 tlin 10 cyuc 0 kcak 4 tcan 1 dwat 110 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli drutta Sequoia sempervirens is an evergreen Tree growing to 110 m (361ft) by 20 m (65ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in leaf all year, in flower from February to April, and the seeds ripen in October. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

tcanta Basketry Dye Insulation Paper Soil conditioner Stuffing WoodA brown dye is obtained from the bark[168]. The bark and the wood contain tannin, but in too low a concentration for economic utilization[223]. On a 10% moisture basis, the bark contains 4.4% tannin and the wood 2.5%[223]. The sprouts from the burls have been used in making baskets[257]. The plant develops a thick covering of a soft and fibrous bark (you can punch it hard without hurting your hand). This can be harvested without harm to the tree and used as an insulating or stuffing material[171]. A fine bark dust that is produced whilst doing this is a good soil conditioner[171]. This fibrous bark is also used for making paper. Branches can be harvested at any time of the year from logged trees, the bark is cut into useable pieces and soaked in clear water prior to cooking for 6 or more hours with lye. The fibres are beaten for six hours in a ball mill and the paper is a brown colour[189]. Wood - straight-grained. knot-free, light, soft, not strong, very durable in contact with the soil. A high quality and easily worked lumber, it is used for joinery, fence posts, construction etc[1, 11, 46, 61, 82, 171, 2291, Carbon Farming - Industrial Crop: biomass.

dwatta Stimulant TonicA poultice of the heated leaves has been used in the treatment of earaches[257]. The gummy sap has been used as a stimulant and tonic in the treatment of rundown conditions[257].

nrakta South-western N. America - Oregon to California. ksacta Deep well-drained soils on flat land and slopes in the coastal fog belt below 600 metres[71, 229].

propta Seed - sow early spring in a cold frame in light shade. Seed can also be sown as soon as it is ripe in a greenhouse. Germination rates are usually very low[11]. Prick out the seedlings into individual pots once they are large enough to handle and grow them on in a cold frame for their first winter, planting them out into their permanent positions in late spring or early summer. Plants will require some protection from the cold and spring frosts for their first year or two outdoors[78]. If there are sufficient seeds, they can be sown in a lightly shaded outdoor bed in late March[78]. Grow on the plants in the seedbed for two years before planting them out into their permanent positions in late autumn or early spring. Cuttings of half-ripe wood. August/September in a frame. They form roots in winter or early spring[1]. Pot them up into individual pots once the roots are developing nicely and plant them out in the summer if they are growing well Otherwise grow them on for the next winter in a cold frame and plant them out in early summer.

nwatta Industrial Crop: Biomass Management: Coppice Minor Global CropLandscape Uses: Christmas tree, Firewood, Hedge, Aggressive surface roots possible, Screen, Specimen, Woodland garden. Requires a rich moist soil[1], growing best in deep sheltered valleys in cool humid areas[81, 200]. Dislikes chalky soils according to one report[1] whilst another says that it succeeds on chalk[200]. Tolerates poorly drained sites[200]. Tolerates partial shade for many years when young[200]. Strongly dislikes windy sites, especially if the winds are cold[200]. Plants dislike atmospheric pollution, growing poorly in cities[185]. Plants are fully hardy in Britain, though they may lose their leaves in cold winters. This seems to have no detrimental effect on the tree[188]. The giant redwood is probably the tallest growing tree in the world[11, 81], it thrives in Britain, especially in the cooler moister western half of the country[11]. It is fast growing in cultivation[81], reaching 25 metres tall in 20 years in a good site[200], and can be successfully coppiced even when quite old[11, 81, 200]. It is a long-lived tree in the wild, often living 1000 years and with some specimens 2200 years old recorded[229]. Plants are tender when young[11]. If trees larger than 80cm are planted out, they should be coppiced in order to allow the roots to become established[200]. Male cones shed their pollen in February unless delayed by

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis 8.2.474 Abronia villosa hpa7tmwatli xre7t hjonli

drutta Oldenlandia diffusa is a ANNUAL growing to 0.3 m (1ft) by 0.3 m (1ft in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

dwatta Alterative Anodyne Antibacterial Antiinflammatory Antitumor Cardiotonic Depurative Diuretic Febrifuge Sedative UrinarySnake-needle grass is a pleasant-tasting cooling, alterative herb that lowers fever, reduces inflammation, relieves pain and is diuretic and antibacterial[238]. It acts mainly on the liver and also stimulates the immune system[238]. The whole plant is alterative, anodyne, antibacterial, anti-inflammatory, antitumor, cardiotonic, depurative, diuretic, febrifuge and sedative[147, 176, 238]. The plant is harvested in the summer and dried for later use[238]. It is taken internally in the treatment of fevers, coughs, asthma, jaundice, impure blood, urinary tract infections, acute appendicitis, biliousness and cancers of the digestive tract[176]. 238, 240]. Externally, it is used in the treatment of snake bites, boils, abscesses and severe bruising[176, 238].

nrakta E. Asia - China, Japan, Korea and Formosa. ksacta Moist ground and fields[238]. A weed of gardens and fields[147]

propta Seed - sow spring in situ.

nwatta Prefers growing in a damp soil in partial shade[238]. This species is not very hardy outdoors in Britain, tolerating temperatures down to about -5°c[238]. It should be possible to grow it as a spring-sown annual in most parts of the country[K].

## 8.2.473 Grindelia humilis

Hairy Gumweed

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 1.5 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwishsom hpa7tmwatli xre7t hjonli

drutta Grindelia humilis is a PERENNIAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

tcanta DyeYellow and green dyes are obtained from the flowering heads and pods. Aromatic.

dwatta Expectorant Homeopathy Sedative SkinThe dried leaves and flowering tops are antiasthmatic, expectorant and sedative[4]. The principal use of this herb is in the treatment of bronchial catarrh, especially when there is an asthmatic tendency[4]. The active principle is excreted from the kidneys, and this sometimes produces signs of renal irritation[4]. The plant has been used in the treatment of itching skin eruptions caused by contact with poison oak (Rhus spp.)[257]. A homeopathic remedy is prepared from the leaves and flowering stems[4].

nrakta Western N. America. ksacta Coastal salt marshes[71].

propta Seed - sow autumn or spring in a cool greenhouse and only just cover the seed. Prick out the plants into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta Succeeds in any well-drained soil in full sun[200]. Does well on dry sandy banks and in poor soils[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. There is some confusion over the correct name for this species. The report on medicinal uses in [4] relates to G. cuniefolia, a name that has been used by two authors. G. cuniefolia. non Nutt. is said to be a synonym of G. humilis and so the entry has been made here.

Desert Sand Verbena

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 0.1 m hkuc htut cyutli kyuctcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Abronia villosa is a ANNUAL growing to 0.1 m (0ft 4in) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

dwatta The plant is used to induce the flow of urine[257]. A poultice of the mashed roots has been used to treat burns[257].

nrakta South-western N. America - Nevada and Arizona to California, ksacta Found in creosote bush scrub from sea level to elevations of 2500 metres in California[276].

propta Seed - sow autumn or early spring very shallowly in pots of sandy soil in a greenhouse[133]. Germination can be very slow unless you peel off the outer skin and pre-soak the seed for 24 hours in warm water[200, 245]. The seed usually germinates in 1 - 2 months at 15°c[133]. When large enough to handle, prick the seedlings out into individual pots and plant them out in early summer.

nwatta Prefers a light well-drained sandy soil in full sun[200]. This species is not very hardy in Britain, though it should succeed outdoors in the southern part of the country, especially if given a warm sheltered site[200]. Seed is rarely ripened on plants growing in Britain[1].

#### 8.2.475 Gutierrezia sarothrae

Broomweed, Broom snakeweed 7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Gutierrezia sarothrae is a deciduous Shrub growing to 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista In large quantities this plant can be toxic to grazing animals, possibly due to the presence of saponins[212,

tcanta Broom Dye Insecticide Kindling SoapThe twigs are tied to sticks and used as brooms[61, 257, 274]. The dried twigs were used as a kindling for starting fires [274]. A vellow dye can be made from the plant tops[257]. An infusion of the leaves has been used as a pleasant and refreshing bath[257]. The chewed leaf juice has an intoxication effect on bees and can kill them[257].

dwatta Antirheumatic Astringent Cancer Cathartic Diuretic Laxative Pectoral Sedative Skin Stings StomachicBroomweed was widely employed medicinally by several native North American Indian tribes who used it to treat a variety of complaints[257]. It is little, if at all, used in modern herbalism. A decoction of the roots has been used in the treatment of painful urination, diarrhoea and stomach aches[257]. The roots have been placed in boiling water and the steam inhaled in the treatment of respiratory complaints[257]. The flowers are laxative[257]. A decoction of the fresh flowers has been used in the treatment of diarrhoea[257]. The leaves are cathartic, febrifuge and sedative[257]. An infusion has been used in the treatment of coughs and colds[257]. It has also been used as a bath to treat fevers and sores, including those caused by venereal diseases[257]. A poultice of the moistened leaves has been used to treat bruises, wounds, sprains, nose bleeds and insect stings[257]. A protein in the plant is reported to have anti-cancer activity[274]. A strong, black infusion of the plant has been used as a rub on rheumatic joints[257].

nrakta Western N. America - Manitoba to Montana, south to Texas and California. ksacta Dry soils of open areas,

pcista All parts of the plant, including the seed, contain toxic alkaloids[175].

kcakta Edible Parts: Leaves OilEdible Uses: Oil-Leaves[177] No further details are given but caution is advised, see the notes on toxicity at the top of the page.

tcanta Essential OilA semi-drying oil is obtained from the seed, used for lighting, soap etc[46, 61, 103, 171, 272]. A medicinal fixed oil (essential oil?) is obtained from the seed[178]. Biodiesel production may be possible from the seed oil using crystalline manganese carbonate.

dwatta Alterative Analgesic Antispasmodic Antitussive Demulcent Emetic Expectorant Hallucinogenic Purgative Sedative Skin WartsThe whole plant is analgesic, antispasmodic, possibly hallucinogenic and sedative [46, 61, 178, 181, 192, 254]. It contains alkaloids similar to those in the opium poppy (P. somniferum) and so can be used as a mild pain-killer[254]. The fresh vellow, milky, acrid sap contains protein-dissolving substances and has been used in the treatment of warts, cold sores, cutaneous affections, skin diseases, itches etc[207, 243, 254]. It has also been used to treat cataracts[254] and has been taken internally in the treatment of dropsy and jaundice[240, 243]. The root is alterative and has been used in the treatment of chronic skin diseases[240, 243]. The flowers are expectorant and have been used in the treatment of coughs and other chest complaints[254]. The seed is demulcent, emetic, expectorant and laxative[240, 243]. An infusion, in small quantities, is used as a sedative for children, but caution is advised since the oil in the seed is strongly purgative[254]. The seed has also been used as an antidote to snake poisoning[240, 243]. The pounded seeds, mixed with mustard oil, are applied externally to treat itchy skin[272]. The oil from the seed is demulcent and purgative[254, 272]. It has been used externally in the treatment of skin problems [240, 243, 272]. Caution is advised in the use of this oil, prolonged ingestion produces toxic effects resembling those occurring in epidemic dropsy[240].

nrakta South-western N. America. Naturalized in C. and S. Europe[50]. ksacta Dry soils along roadsides and in waste places and fields[72, 192].

propta Seed - sow April in situ[200]. The seed usually germinates in 3 - 4 weeks at 15°c[134].

nwatta Easily grown in a light soil in a sunny position[1, 134, 1661. Does best in a poor well-drained soil[134]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Usually grown as a hardy annual in Britain[1]. It resents being transplanted and should be sown in situ[134].

# 8.2.396 Bouteloua gracilis

Blue Grama

7 tlin 10 cvuc 1 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Bouteloua gracilis is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH; mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Seed - raw or cooked[257]. It can be ground into a powder, mixed with water and eaten as a mush, often with corn meal[257]. It is also used to make bread[257].

tcanta Basketry Broom BrushThe grass is sometimes used in the fill of coiled basketry[216, 257]. The stems can be used as a comb and broom material[257]. The blades can be bundled by a cord and the stiff end used as a hair comb whilst the other end can be used as a broom[257].

dwatta Salve Women's complaintsThe chewed roots have been applied to cuts[257]. A decoction of the whole plant has been used as a post-partum medicine[257].

nrakta Southern N. America - Wisconsin to North Dakota, south to Arizona and Mexico, ksacta Deserts and prairies[216, 235]. Grows in pure stands in mixed prairie associations and disturbed habitats, usually on rocky or clay soils and mainly at elevations of 300-3000 metres[270].

propta Seed - sow spring in a greenhouse. Only just cover the seed. Prick out the seedlings into individual pots

when large enough to handle and grow on for at least the first winter in a greenhouse. Plant out in early summer. Division.

nwatta Easily grown in full sun on any well-drained garden soil[200]. Prefers a near-neutral or lime-free soil[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. All members of this genus use the method of photosynthesis knwn as C4. This allows for the more effective capture of carbon dioxide and thus less water loss through transpiration since the stomata do not have to be open for transpiration. This is an advantage in the arid environments where these plants are usually found[274].

# 8.2.397 Coprosma serrulata

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.6 m hkuc hmimhtut cyutli tcup hwicli hrasilut hpa7tli flatprik hpa7tmwatli nvanhien hionli

drutta Coprosma serrulata is an evergreen Shrub growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: CoffeeFruit - raw or cooked. Sweet, but little flavour[225]. The orange-red fruits are about 8mm in diameter[225]. The roasted seed is an excellent coffee substitute[153].

tcanta DyeA yellow dye is obtained from the wood, it does not require a mordant[153].

nrakta New Zealand. ksacta Montane to lower subalpine forest, shrubland and grassland, from latitude 41° south and southwards on South Island[44].

propta Seed - probably best sown as soon as it is ripe in a greenhouse or cold frame[K]. Sow stored seed in spring in a cold frame[200]. Germination can be slow, often taking more than 12 months even when fresh seed is used[K]. When the seedlings are large enough to handle, prick them out into individual pots. Grow on the plants for at least their first winter in a greenhouse and plant out in late spring or early summer. Give the plants some protection from the cold for their first winter outdoors[K]. Cuttings of mature wood of the current year's growth, autumn in a frame.

nwatta Requires a moist, very well-drained neutral to slightly acid soil in full sun or light shade[200]. Succeeds in most soils, so long as they are well-drained[225]. Somewhat intolerant of frost, this species is only likely to succeed outdoors in the milder areas of Britain[200]. Plants are proving to be hardy in an Essex garden[225]. Hybridizes freely with other members of this genus[200, 225]. Plants are normally dioecious, though in some species the plants produce a few flowers of the opposite sex before the main flowering and a few hermaphrodite flowers are sometimes produced[225]. Male and female plants must usually be grown if seed is re-

#### 8.2.398 Peganum harmala

Syrian Rue, Harmal peganum 7 tlin 10 cyuc 1 kcak 0 tcan 3 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlut hpa7tli flatpriklwishsom hpa7tmwatli xre7t hionli

drutta Peganum harmala is a PERENNIAL growing to 0.6 m (2ft) by 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. The seeds ripen in September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in saline soils. It cannot grow in the shade. It prefers dry or moist

pcista Use with caution. Although the seed is used medicinally and as a condiment, it does contain hallucinogenic and narcotic alkaloids[238]. When taken in excess it causes hallucinations and vomiting[238].

kcakta Edible Parts: Oil OilEdible Uses: Condiment Oil OilSeed - used as a spice and purifying agent[105, 177, 183, 238]. Some caution is advised because the seed has narcotic properties, inducing a sense of euphoria and releasing inhibitions[169]. An edible oil is obtained from the seed[46, 61].

tcanta Dye Incense Miscellany Oil Oil ParasiticideA red dye is obtained from the seed[46, 61]. It is widely used in Western Asia, especially as a colouring for carpets[192]. The ripe seed contains 3.8 - 5.8% of the alkaloids harmine, harmaline, harmalol and peganine[240]. Ineffective as a contact poison, they are active in vapour form where they are effective against algae, in higher concentrations to water animals and lethal to moulds, bacteria and intestinal parasites[240]. The seed is used as an incense[145].

dwatta Abortifacient Alterative Aphrodisiac Digestive Diuretic Emmenagoque Epilepsy Galactogogue Hallucinogenic Miscellany Narcotic Ophthalmic Parasiticide Urinary Uterine tonic VermifugeAlterative[46, 169]. The fruit and seed are digestive, diuretic, hallucinogenic, narcotic and uterine stimulant[192, 238]. They are taken internally in the treatment of stomach complaints, urinary and sexual disorders, epilepsy, menstrual problems, mental and nervous illnesses[238]. The seed has also been used as an anthelmintic in order to rid the body of tapeworms[240]. This remedy should be used with caution and preferably under the guidance of a qualified practitioner since excessive doses cause vomiting and hallucinations[238]. The seeds contain the substance 'harmine' which is being used in research into mental disease, encephalitis and inflammation of the brain[192]. Small quantities stimulate the brain and are said to be therapeutic, but in excess harmine depresses the central nervous system[192]. A crude preparation of the seed is more effective than an extract because of the presence of related indoles[192]. Consumption of the seed in quantity induces a sense of euphoria and releases inhibitions. It has been used in the past as a truth drug[169, 187]. The oil obtained from the seed is said to be aphrodisiac[192]. The oil is also said to have galactogogue, ophthalmic, soporific and vermifuge properties[192]. The seed is used externally in the treatment of haemorrhoids and baldness[238]. The whole plant is said to be abortifacient, aphrodisiac, emmenagogue and galactogogue[240]. A decoction of the leaves is used in the treatment of rheumatism[240]. The root has been used as a parasiticide in order to kill body lice[240]. It is also used internally in the treatment of rheumatism and nervous conditions[254].

nrakta Europe - Mediterranean and Southeast Europe. ksacta Dry steppes, especially where grazing is heavy[187], and dry waste places[50]. It is often found in saline soils[254].

propta Seed - sow late spring in a greenhouse. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in a sunny part of the greenhouse for their first winter. Be careful not to overwater, especially when the plants are dormant. Plant out into their permanent positions in late spring or early summer[K]. Division in late spring[238].

watta Prefers a light well-drained but moisture retentive soil and an open position in full sun[200]. Prefers a dry soil[187] and succeeds in poor soils[238]. Although this species comes from dry desert areas, it responds well to cultivation so long as the soil is very well drained[238]. It can tolerate temperatures down to about -20°c if the soil is dry[187]. There is speculation that this plant was the sacred 'Soma' plant, which was used by the ancients of India and Persia as an hallucinogenic aid to understanding the deeper meaning of life[238].

#### 8.2.399 Epilobium glabellum

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 0.2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Epilobium glabellum is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid,

neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: LeavesEdible Uses: Young leaves and shoots - cooked.

tcanta A useful ground cover plant[188].

dwatta Diuretic UrinaryTreats urinary disorders[154]. nrakta Australia, New Zealand. ksacta Loamy soils, flats and hillsides in eastern Australia[154].

propta Seed - sow early spring in situ or as soon as the seed is ripe. Division in spring or autumn. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Prefers a well-drained but moisture retentive soil in a sunny position or in partial shade[187, 200]. Succeeds in most soils[1]. Possibly hardy to about -15°c[187]. Plants are semi-evergreen[188].

#### 8.2.400 Sedum stoloniferum

Stolon stonecrop, Sedum

7 tlin 9 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Sedum stoloniferum is an evergreen Perennial growing to 0.2 m (0ft 8in) by 0.5 m (1ft 8in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

kcakta Edible Parts: LeavesEdible Uses: Leaves - raw or cooked.

nrakta E. Europe to W. Asia - Caucasus to Iran. ksacta Stony soils in meadows and woodlands in the middle and lower mountain zones between 600 and 2000 metres[83].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Landscape Uses:Border, Container, Ground cover, Massing, Rock garden, Seashore. Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are very drought tolerant[200], they grow well in dry soils and can be grown on a wall or in crevices in a rock garden[83]. Hardy to at least -15°c[200]. This plant often disappears from its planted position and then turns up in a new location, are birds responsible for this[83]? Closely related to S. spurium[200]. This species has pink flowers[200]. All members of this genus are said to have edible leaves, though those species that have yellow flowers can cause stomach upsets if they are eaten in quantity[62, 85]. Plants in this genus seem to be immune to the predations of rabbits[233]. Special Features:Attractive foliage, Not North American native, Naturalizing, Attractive flowers or blooms

## 8.2.401 Androstephium caeruleum

Blue Funnel Lily

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc

htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Androstephium caeruleum is a BULB growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy

can be pruned back hard in spring to encourage freer flowering[182]. An excellent plant for bees and butterflies[30]. Dioecious. Male and female plants must be grown if seed is required.

# 8.2.469 Lagerstroemia indica

Crepe Myrtle, Crepeflower

7 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 5 m hkuc

htut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lagerstroemia indica is a deciduous Shrub growing to 5 m (16ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from July to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

tcanta WoodWood - hard. A useful timber[146].

dwatta Astringent Depurative Diuretic Febrifuge Hydrogogue Purgative Stimulant StypticThe stem bark is febrifuge, stimulant and styptic[218, 240]. The bark, flowers and leaves are considered to be hydrogogue and a drastic purgative[240]. A paste of the flowers is applied externally to cuts and wounds[272]. The root is astringent, detoxicant and diuretic[147, 218]. A decoction of the flowers is used in the treatment of colds[218].

nrakta E. Asia - China, Korea. ksacta Open grassy places and on cliffs at low altitudes[11], also on forest edges[147].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[78]. Another report says to sow spring in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 8cm with a heel, July/August in a frame. Fair to good percentage[78]. Cuttings of mature wood in the winter in a frame[200]. Root cuttings 4cm long in December. High percentage[78].

nwatta Landscape Uses:Border, Container, Massing Pollard, Standard, Specimen, Street tree. Succeeds in most well-drained soils in a sunny sheltered position[184, 200]. Succeeds in a hot dry position. Succeeds in soils low in nutrients[200]. Dislikes very alkaline soils[202]. Dormant plants are hardy to about -10°c if the wood is well ripened[184]. They require very hot and humid summers and preferably the protection of a south facing wall if they are to flower in Britain[182, 260]. Plants are hardy in a very sunny position in southern England but they only flower in consistently warm summers[11]. Plants are much hardier when the wood is thoroughly ripened by the sun[166, 200]. A very ornamental plant[1], there are many named varieties[200]. Flowers are produced in broad panicles on the tips of the current years growth[219]. Any pruning is best carried out in the spring in order to encourage new growth[219]. Young plants grow fairly quickly and will often flower in their first year after planting out[219]. Plants do not transplant well and should be moved with a large rootball[200]. This species is notably resistant to honey fungus[200]. Special Features: Not North American native, Blooms are very showy.

# 8.2.470 Geum pentapetalum

Aleutian avens

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 0.2 m hkuc hmimhtut cyutli tcuphja7n hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Geum pentapetalum is an evergreen Shrub growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist or wet soil.

dwatta Anodyne Astringent FebrifugeThe whole plant, but especially the root, is anodyne, astringent, febrifuge. It is especially good in the treatment of children with fevers etcl 1781

nrakta E. Asia - Japan, Kamchatka, Aleutian Islands. ksacta Wet slopes and sometimes on sphagnum bogs in high mountains, C. and N. Japan[58]. Stony ground in mountain valleys[178].

propta Seed - sow spring or autumn in a cold frame[200]. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in the summer Division in spring or autumn. This should be done every 3 - 4 years in order to maintain the vigour of the plant[200]. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring.

nwatta Easily grown in any moderately good garden soil that is well-drained[1]. Prefers a soil rich in organic matter[200]. Plants are hardy to about -10°c but in areas with prolonged cold winter temperatures it is best to give the plants a protective mulch of evergreen branches or dry bracken[200]. Cultivated as a medicinal plant in Szechwan, W. china[178]. Hybridizes freely with other members of this genus[200].

## 8.2.471 Daphne gnidium

Flay-Leaved Danhn

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 1.5 m hkuc hmimhtut cyutli kyuctcup hwicli hyisjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Daphne gnidium is an evergreen Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista All parts of the plant are poisonous[76]. Skin contact with the sap can cause dermatitis in some people[200].

dwatta CancerThe plant contains toxic compounds that are being investigated for anti-leukaemia effects[238].

nrakta S. Europe, N. Africa and W. Asia. ksacta Grows with other evergreen shrubs on shallow, stony soils, often on billeides.

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°c followed by 12 - 14 weeks at 3°c. Germination may still take another 12 months or more at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Root cuttings, December in a greenhouse

nwatta Prefers a well-drained but moisture-retentive slightly acid to slightly alkaline soil[200]. A good sandy loam suits most members of the genus[11]. This species is not very hardy in Britain, tolerating temperatures down to about -5°c, it should succeed outdoors in the milder areas of the country[238]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188]. The flowers, which are produced in terminal clusters, are sweetly scented[245].

# 8.2.472 Oldenlandia diffusa

Snake-Needle Grass

7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat 0.3 m hkuc

leaves of Crotalaria alata, is used in the treatment of

nrakta E. Asia - N. India. ksacta Dry slopes and amongst rocks[146], especially on exposed sunny slopes, 1200 - 2250

propta Seed - cold stratify for 4 weeks at 4°c[138] and surface sow the seed in February/March in a greenhouse[78, 113] (the pre-chilling might not be required for this species). Germination usually takes place within 3 - 4 weeks at 21°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Seedlings are inclined to damp off and so should be watered with care and kept well-ventilated[78]. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Use short side-shoots[78]. Very high percentage[113]. Cuttings of mature wood of the current season's growth, 15 - 20cm long, October/November in a frame[200].

nwatta Requires a sunny position[1, 11]. Succeeds in most well-drained garden soils but it prefers a rich loamy soil[1, 11, 200]. Very tolerant of alkaline soils[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. It resprouts freely from the base if cut back by severe weather[200]. Probably not in cultivation[11], this species is much confused with B. crispa. Benth[158]. A very ornamental plant[1], it hybridizes freely with other members of this genus[200]. An excellent plant for bees and butterflies[30]. Dioecious. Male and female plants must be grown if seed is required.

### 8.2.467 Cortaderia selloana

Pampas Grass

7 tlin 11 cyuc 0 kcak 2 tcan 0 dwat 3 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Cortaderia selloana is an evergreen Perennial growing to 3 m (9ft) by 1.2 m (4ft in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 5 and is not frost tender. It is in leaf all year, in flower from August to October, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required), and is pollinated by Wind. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerates strong winds but not maritime exposure

tcanta Fibre PaperA fibre obtained from the leaves is used for making paper[46, 61, 74, 189]. The leaves are harvested in the autumn, they are cut into usable pieces and soaked for 24 hours in clear water. They are then cooked for 2 hours with lve and then beaten in a blender. The fibre makes a yellow paper[189]. The feathery flower head plumes, when dried, are widely used in flower arrangements and other ornamental displays.

nrakta S. America - temperate areas. Sometimes persists in Britain as a garden throw-out[17]. ksacta Moist sandy soils[187] on river banks and mountains in Chile[139].

propta Seed - surface sow March/April in a greenhouse. The seed usually germinates in 2 - 3 weeks at 15°c. Keep the soil moist. The seed has a short viability [200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in late spring[1]. It can be very difficult to obtain divisions from this plant because they tend to be very large and to be very close to the main clump. We have found it best to use a sharp spade to cut into the main clump and break off the divisions. These are then potted up in light shade in a cold frame and are planted out once they have rooted well and are in active growth.

nwatta Agroforestry Services: Windbreak Industrial Crop: Biomass Management: Hay Minor Global CropLandscape Uses:Container, Massing, Specimen. Succeeds in most soils, preferring a damp well-drained sandy or loamy soil[1]. Inclined to be intolerant of cold clay soils[162]. Succeeds in dry soils. Prefers a sunny sheltered position[1, 162, 200]. Very tolerant of maritime exposure[K]. This species is hardy to about -20°c[187] if the winter is not excessively wet, though it is intolerant of prolonged periods of cold weather. Pampas grass is occasionally cultivated in some areas for its fibre which is used in making paper. Plants grow well as a focal point in a lawn and they also succeed in quite coarse grass[1, 233]. A number of named forms have been selected for their ornamental value[187, 200]. The leaves have sawtoothed edges, it is best to wear gloves when working with the plant[200]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. Dioecious. Male and female plants must be grown if seed is required[200]. The inflorescence on the male plant is rather erect whilst it has wide spreading branches on the female[187]. Special Features: Attracts birds, Attractive foliage, Not North American native, Suitable for cut flowers, Suitable for dried flowers, Attractive flowers or blooms

#### 8.2.468 Buddleia officinalis

7 tlin 10 cvuc 0 kcak 0 tcan 2 dwat 2 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Buddleia officinalis is an evergreen Shrub growing to 2 m (6ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from December to February. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

dwatta Antispasmodic Febrifuge OphthalmicFebrifuge[1] 174, 178]. The flowers and flower buds are antispasmodic, slightly cholagogue and ophthalmic[176]. They have an action similar to vitamin P, reducing the permeability and fragility of the blood vessels of the skin and small intestine[176]. They are used in the treatment of various eye problems[176, 218]. They are also used in the treatment of gonorrhoea, hepatitis and hernia[218]. A decoction of the leaves is used in the treatment of collyrium[218]. Also used in the treatment of gonorrhoea, hepatitis and hernia[218].

nrakta E. Asia - western China. ksacta River vallevs of Szechwan in dry rocky areas to 1000 metres[178]. Cliffs, scrub and waste places at elevations up to 1,000 me-

propta Seed - cold stratify for 4 weeks at 4°c[138] and surface sow the seed in February/March in a greenhouse[78, 113] (the pre-chilling might not be required for this species). Germination usually takes place within 3 - 4 weeks at 21°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Seedlings are inclined to damp off and so should be watered with care and kept well-ventilated[78]. Cuttings of half-ripe wood, July/August in a frame[11, 113]. Use short side-shoots[78]. Very high percentage[113]. Cuttings of mature wood of the current season's growth, 15 - 20cm long, October/November in a frame[200].

nwatta Requires a sunny position[11, 182]. Prefers a rich loamy soil but succeeds in most well-drained soils[1, 11. 2001. Very tolerant of alkaline soils[200]. Requires a site sheltered from the wind because the leaves are easily damaged[260]. Tolerating temperatures down to about -10°c[184], this species is hardy in Cornwall[11, 166] but not in most parts of Britain[1]. It resprouts freely from the base if cut back by severe weather[200]. A very ornamental plant[1], it hybridizes freely with other members of this genus[200]. Plants flower on the current years growth and to UK zone 8. It is in flower from April to May. The species It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb[105, 161]. No more details are given, but the bulb is rather small, usually less than 25mm in diameter[235].

nrakta Southern N. America - Kansas to Texas. ksacta Prairies and grassy slopes, frequently in rocky areas at elevations of 100 - 800 metres[235, 270, 274].

propta Seed - best sown in a cold frame as soon as it is ripe[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in a frame or greenhouse until large enough to go outdoors. Plant out whilst the plants are dormant in the autumn. Division of offsets when the plant is dormant in late summer.

nwatta Requires a very well-drained rich sandy loam and a sunny position[1, 200]. When the bulbs are planted about 15cm deep, they are generally hardy in Britain[1]. Another report says that plants are hardy to -10°c or more if the drainage is perfect. This species is sometimes included in the genus Bessera[1].

# 8.2.402 Heimia myrtifolia

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Heimia myrtifolia is a deciduous Shrub growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to September. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta An intoxicating and euphoric drink is made by crushing the wilted leaves in water and leaving the liquid in a sunny position for three days to ferment[192]. In larger quantities this can induce hallucinations and produces a vision that is typically overcast in yellow[192].

dwatta The leaves are antispasmodic, hallucinogenic and sedative[192]. An infusion serves to stabilize the blood pressure and relieve anxiety[192].

nrakta S. America - Brazil to Uruguay. ksacta Along the sides of streams[192].

propta Seed - we have no information for this species but suggest sowing the seed in spring in a greenhouse. Prick out the seedlings into individual pots once they are large enough to handle. Grow the young plants on for at least their first winter in a greenhouse and plant out in late spring or early summer. Mulch the roots well in the autumn to protect them from the cold. Cuttings of half-ripe wood, July/August in a

nwatta Easily grown in any well-drained soil in full sun[200]. Especially in the colder areas of the country this plant is best grown against a sunny south or south-west facing wall and given a good mulch of bracken in the winter[200]. The rootstock is fairly hardy in most of Britain, whilst the top growth tolerates temperatures down to about -10 to -15°c[200]. If cut back by severe weather the plant usually grows again from the base[200]. Flowers are produced on the current seasons growth[200]. Plants growing outdoors at Kew Botanical Gardens are cut back by the cold each winter but regrow and flower each year[11]. This species is closely related to H. salicifolia, differing mainly in having smaller flowers[11]. Any pruning is best carried out in early spring by removing excess growth at the base of the nlant[2001

# 8.2.403 Bloomeria aurea

Golden Stars, Common goldenstar 7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasilut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Bloomeria aurea is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Bulb[161, 257]. No more details are given, but the bulbs of the closely related B. crocea can be eaten raw at any time of the year[K].

nrakta South-western N. America - California. ksacta Dry flats and hillsides, often in heavy soils and especially in foothill woods, to 1500 metres. in California[71].

propta Seed - sow as soon as it is ripe or February/March in a well-drained compost in the greenhouse. Germination usually takes place within 1 - 3 months at 15°c[134]. Sow the seed thinly so that it can be grown on in the pot without disturbance for the first year, but apply an occasional liquid feed to ensure the plants do not become nutrient deficient. Pot up the small bulbs when they are dormant, putting 2 - 3 bulbs in each pot, and grow them on in a cold frame for another 2 years[134] before planting them out in the autumn when they are dormant. Division of flowering size offsets in the autumn. They are freely produced[200]. The larger bulbs can be planted straight out into their permanent positions if required, whilst it is best to pot up the smaller bulbs and grow them on for a year in a cold frame before planting them out in the autumn.

nwatta Requires a well-drained rich sandy loam and a warm position[1, 138]. Likes plenty of moisture when in growth[200], but plants should be kept quite dry from when the foliage dies down until the autumn[138]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This species is probably no more than a part of B, crocea[200].

## 8.2.404 Zephyranthes atamasca

Atamasco Lily

7 tlin 10 cyuć 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Zephyranthes atamasca is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to July, and the seeds ripen from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The bulb contains toxic compounds[62]. Horses are said to get the staggers (a cerebrospinal disease) from eating the leaves and bulbs[207].

kcakta Edible Parts: RootEdible Uses: Bulb - cooked[2, 22, 46, 61]. It is used as an emergency food when better foods are in short supply[61, 161]. The bulb is up to 3cm long[235]. Caution is advised, see the notes above on toxic-

nrakta Southern N. America - Missouri and Virginia to Florida. ksacta Rich, mixed forests, moist clearings, meadows, moist to wet pastures, coastal plains and piedmonts from sea level to 700 metres[270].

propta Seed - sow spring in a greenhouse. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first year of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in the summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. Division of offsets after the plant dies down in late spring or early summer. Larger bulbs can be planted out direct into their permanent positions whilst it is best to pot up the smaller bulbs and grow them on in the greenhouse for a year before planting them out.

nwatta Requires a position in full sun when grown outdoors in Britain and a well-drained moisture retentive soil[1, 42, 2001. It strongly dislikes excessive wet, especially in the winter[200]. Plants require a definite dry resting period in late summer, if they receive water at this time they are excited into growth and can then be killed in cold weather [120].

A very ornamental plant[1], it is hardy to about -5°c and can succeed outdoors in the milder areas of Britain[200]. However, because it is in growth during the winter, it is generally best grown in a cold greenhouse or special bulb frame[K]. Bulbs should be planted about 10cm deep[200].

# 8.2.405 Eminium spiculatum

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Eminium spiculatum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista Many plants in this family are poisonous raw, due to the presence of calcium oxylate crystals. If eaten raw, this toxin gives you a sensation as if hundreds of tiny needles are sticking into the mouth, tongue etc. However, it is easily destroyed by thoroughly cooking or drying the plant. Although no specific mention has been seen for this plant it is wise to assume that it is noisonous in its raw state.

kcakta Edible Parts: RootEdible Uses: Root - cooked. Some caution is advised, see the notes above on toxicity.

nrakta S. Europe - Mediterranean to W. Asia. ksacta Dry rocky places[200].

propta Seed - best sown in a greenhouse as soon as it is ripe, though the seed can also be sown in early spring. Prick out the young seedlings into individual pots as soon as they are large enough to handle and grow them on in the greenhouse for at least their first winter, planting out in late summer when the plants are dormant[200]. Division in late summer when the olants are dormant[200].

nwatta Requires a deep light fertile perfectly drained soil in a sunny position[200]. Strongly dislikes wet soils, it also need a period of warm dry weather when it is dormant in late summer in order to promote good flowering the following year[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c so long as the soil is well-drained[200]. It is usually best grown in a bulb frame or cold greenhouse, but can succeed outdoors at the base of a south-facing wall and also in a rock garden in dry summer areas. The flowers are malodorous, attracting flies for pollination[200]. The fruit is developed at the base of the flowering stem, usually below ground, breaking the soil surface to disperse the seed[200].

# 8.2.406 Gynandriris sisyrinchium

Spanish Nut

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.2 m hkuc hmimhtut cyutli kyuctcup hwicli jlutnyikfrip hpa7tli prikl-

wisslip hpa7tmwatli xre7t hjonli

drutta Gynandriris sisyrinchium is a PERENNIAL growing to 0.2 m (0ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista Possibly poisonous[65].

kcakta Edible Parts: RootEdible Uses: CondimentThe root is edible raw or cooked and is also used as a spice[2, 105, 177]. Some caution is advised, see the notes above on toxicity.

nrakta Europe - Mediterranean. ksacta Dry places near the coast[50] and up to 2,000 metres[90].

propta Seed - best sown in a cold frame as soon as it is ripe[1]. Stored seed should be sown as soon as possible in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into

their permanent positions in late spring or early summer, after the last expected frosts. Division.

nwatta Easily grown in a stiff limey soil in full sun[42]. Tolerates some shade[79]. Plants need plenty of moisture whilst in growth in winter and spring, but need a dry soil when they die down in the summer[188]. This species is not very hardy in Britain, tolerating temperatures down to about -5°c[200], and in general does not do well in this country[1]. It requires a summer baking to ripen the roots and ensure good flowering in the following year[200]. It should be planted about 10 - 15cm deep[79]. It is probably best grown in a bulb frame[K]. The flowers usually open in the afternoon and are faded by the morning[90].

## 8.2.407 Callicarpa mollis

It prefers moist soil.

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat m hkuc htut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli

xre7t hjonli drutta Callicarpa mollis is a deciduous Shrub growing to 2.4 m (7ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade.

kcakta Edible Parts: FruitEdible Uses: Fruit[105, 177, 179]. No further details are given.

nrakta E. Asia - Central and S. Japan, Korea. ksacta Rich woods and thickets. In forests from the lowlands to elevations of 500 metres[275].

propta Seed - sow February in a greenhouse[78]. Only just cover the seed[138]. Germination usually takes place within 1 - 3 months at 18°c[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood 10cm long, July/August in a frame. High percentage[78]. Cuttings of mature wood of the current season's growth with a heel[78] taken in early spring[200].

nwatta Requires a sunny position or light dappled shade[1, 200]. Prefers a highly fertile well-drained loamy soil[1, 200]. Plants are only really hardy in the milder parts of Britain and even then they need the protection of a wall[182, 200]. Requires cross-pollination for good fruit production[182]. Plants in this genus are notably resistant to honey fungus[200].

# 8.2.408 Origanum x hybridum

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc hmimhtut cyutli kyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Origanum x hybridum is a PERENNIAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Edible Uses: CondimentThe aromatic foliage is used as a condiment[177].

nrakta W. Asia - Levant. ksacta Not known

propta Seed - sow in a greenhouse in early spring at 10-13°c and only just cover the seed. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer. This is a hybrid species and will not breed true from seed. Division in March or October. Very easy, larger divisions can be planted out direct into their permanent positions. We have found that it is better to pot up the smaller divisions and grow them on in light shade in a cold frame until they are well established before planting them out in late spring or early summer. Basal

complaints[4]. Some caution is advised, however, because like all essential oils, it can have a deleterious effect on the body in larger doses[4]. An oleo-resin is exuded from the tree[238]. It can also be obtained from the tree by making incisions in the trunk[4, 152]. This resin contains tannin and is powerfully astringent, it is used internally in the treatment of diarrhoea and bladder inflammation[4, 152, 238], externally it is applied to cuts etc[4, 152]. Treats throat ailments[156].

nrakta Australia - Tasmania, Victoria, southern New South Wales ksacta Often a shelf species in hilly areas, growing on southern and eastern aspects where there is air drainage to lower frost hollows, frequently dominant in areas suited to it; at elevations usually from 300 - 1,500 metres, but to sea level in Tasmania [1658].

propta Seed - surface sow late winter/early spring in a sunny position in a greenhouse[11, 78, 134]. Species that come from high altitudes appreciate 6 - 8 weeks cold stratification at 2c[200]. Pot up the seedlings into individual pots as soon as the second set of seed leaves has developed, if left longer than this they might not move well. Plant out into their permanent positions in early summer and give them some protection from the cold in their first winter. The seed can also be sown in early summer, the young trees being planted in their final positions in late spring of the following year. The seed has a long viability[200].

nwatta Eucalyptus delegatensis is native to the temper-

ate climate of southeastern Australia, where it is found at elevations up to 1,500 metres. Summers are warm and can be dry, with most rainfall occurring in the winter months and a dry season that can be up to 3 months long. Mean annual rainfall is within the range 2.500 - 3.700mm, sometimes as snow; mean maximum of the hottest month is 21c; mean minimum of the coldest month is 0c, and there are generally around 70 - 100 frosts a year[1658]. When dormant, the plant can survive temperatures down to about -12c, but young growth is more tender and can be severely damaged at -1c[418]. Requires a sunny position, succeeding in a wide range of well-drained soils of high to moderate fertility[418]. The soils of the better forests in which it grows are moist but well-drained loams, especially those derived from granites or dolerites, but the mother rock may be a variety of sedimentary deposits in some places[1658]. Prefers a pH in the range 5.5 - 6.5, tolerating 5 - 7[418]. A quick-growing tree that is easy to regenerate[1658]. It responds well to coppicing[1212]. Eucalyptus delegatensis occurs at a higher elevation than any other important timber species in Australia. The natural occurrences of the species are likely to have snow on the ground for several weeks each year 1658 ]. Annual wood production potential is 10 - 25 cubic metres per hectare[418]. Eucalyptus species have not adopted a deciduous habit and continue to grow until it is too cold for them to do so. This makes them more susceptible to damage from sudden cold snaps. If temperature fluctuations are more gradual, as in a woodland for example, the plants have the opportunity to stop growing and become dormant, thus making them more cold resistant. A deep mulch around the roots to prevent the soil from freezing also helps the trees to survive cold conditions[200]. Many members of this genus are remarkably adaptable however, and there can be a dramatic increase in the hardiness of subsequent generations from the seed of survivors growing in temperate zones[200]. The tree has good prospects for planting in cool areas with a fairly high winter rainfall. It is one of the eucalypts resistant to frosts at least as severe as 9c at the time of planting[1658 ]. It has beens introduced into South Africa in Zones E and G on a relatively small scale and showed good height and diameter growth, but did not become a preferred species. Several countries have good specimens but the main commercial plantations are in New Zealand. In New Zealand it is planted both in containers and as bare-rooted planting stock. With adequate root-pruning good seedlings are prepared and planted either by hand or by machine The trees grow vigorously but the leading shoot is attacked each autumn by the fungus Mycosphaerella nubilosa, which results in multiple leaders. One of these becomes the main stem early in the next growing season, but successive attacks of the fungus cause a series of large branches to develop on the trunk. This is not of great significance if the crop is being grown for pulpwood, but is more serious in the case of sawtimber[1658].

# 8.2.465 Tagetes micrantha

Licorice marigold

7 tlin 9 cyuc 0 kcak 3 tcan 1 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis

hpa7tmwatli xre7t hjonli

drutta Tagetes micrantha is a ANNUAL growing to 0.3 m (1ft). See above for USDA hardiness. It is hardy to UK zone 7 and is frost tender. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista We have no information on this species, though other members of the genus have an irritant sap that can cause dermatitis in sensitive people[238].

tcanta CompanionMany members of this genus are widely used in companion planting schemes[238]. Secretions from the roots of growing plants have an insecticidal effect on the soil, effective against nematodes and to some extent against keeled slugs. These secretions are produced about 3 - 4 months after sowing[200]. These root secretions also have a herbicidal effect, inhibiting the growth of certain plants growing nearby. It has been found effective against perennial weeds such as Ranunculus ficaria (Celandine), Aegopodium podagraria Ground elder). Glechoma hederacea (Ground ivy), Agropyron repens (Couch grass) and Convolvulus arvensis (Field bindweed)[200, 238]. An essential oil distilled from the leaves and flowering stems, harvested when the plant is forming seeds, is used as an insect repellent [46, 61]. It is also used in perfumery[238]. Dried plants can be hung indoors as an insect repellent[238]. Dynamic accumu-

dwatta The plant is used as a remedy for stomach complaints, colds and fevers[257].

nrakta Southern N. America - Mexico. An occasional casual in Britain[17]. ksacta Disturbed sites, in open woodlands with scattered pines and junipers. Low areas and where puddles persist along the road.

propta Seed - sow March in a greenhouse. Only just cover the seed. Germination usually takes place within 2 weeks. When they are large enough to handle, prick the seedlings out into individual pots and plant them out after the last expected frosts.

nwatta Requires a well-drained moderately fertile soil in a sunny position[200]. Plants are not very resistant to frosts and need to be grown as half hardy annuals. Removing dead flowers before the seed is formed will extend the flowering season[188]. Most members of this genus are very good companion plants, see 'Other Uses' below for more details[238]. Plants are prone to slugs, snails and botrytis[188].

#### 8.2.466 Buddleia paniculata

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 6 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli nyanhjen hjonli

drutta Buddleia paniculată is a deciduous Shrub growing to 6 m (19ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in July, and the seeds ripen from September to October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees, Lepidoptera (Moths and Butterflies). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. It can tolerate atmospheric pollution.

tcanta Fuel Pioneer Soil stabilization WoodPlants are fairly fast growing and have an extensive root system, they are useful as pioneer species for restocking bare hillsides and preventing soil erosion on the slopes[158]. Wood - moderately hard, close grained. Used only as a fuel[146, 158].

dwatta Astringent Dysentery FebrifugeA decoction of the leaves is used in the treatment of diarrhea and dysentery[272], A decoction of the leaves, combined with the

# 8.2.462 Ligustrum sinense

Chinese Privet

7 tlin 10 cvuc 0 kcak 0 tcan 1 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ligustrum sinense is an evergreen Shrub growing to 3 m (9ft 10in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 3. It is in leaf all year, in flower in July, and the seeds ripen in October. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no reports of toxicity have been seen for this species, at least one member of this genus is recorded as being mildly toxic and it is quite possible that other members of the genus also contain toxins[65].

tcanta Hedge HedgeMuch cultivated as a hedge and screen plant in N. America[227].

dwatta FebrifugeThe bark is used as an antipyretic[266]. nrakta E. Asia - China, Japan. ksacta Thin woods and thickets in lowland and hills all over Japan[58]. Mixed forests, valleys, along streams, thickets, woods, ravines at elevations of 200 - 2600 metres[266].

propta The seed does not require any pre-treatment and can be sown in the spring in a cold frame[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5 - 10cm with a heel, July/August in a frame. Very easy[78]. Cuttings of mature wood. 20 - 30cm in a sheltered outdoor bed in November/December. High percentage[78].

nwatta Landscape Uses:Border, Hedge, Standard, Specimen. A very tolerant and easily grown plant, it succeeds in any soil that is not impoverished or water-logged[11, 182]. Grows well in heavy clay soils. This species has become a problematic invader of native habitats in N. America, becoming the dominant understorev shrub in some areas [274]. This species is notably susceptible to honey fungus[200]. Special Features: Attractive foliage, Not North American native, Invasive, Naturalizing, Attracts butterflies, Attractive flowers or blooms.

# 8.2.463 Clerodendrum bungei

Glory Flower, Rose glorybower, Cashmere Bouquet, Mexican Hydrangea, Glory Bower

7 tlin 9 cvuc 0 kcak 0 tcan 1 dwat 2 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Clerodendrum bungei is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in flower from August to September, and the seeds ripen from September to November. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

dwatta Anodyne Anthelmintic Antiinflammatory CarminativeA decoction of the leaves is applied externally as an anodyne, anthelmintic, anti-inflammatory, carminative[147, 2181

nrakta E. Asia - China to N. India. ksacta Waste places, hillsides and damp shady roadsides to 2300 metres[147]. Mixed forests on mountain slopes and along the sides of roads, below 2500 metres[266].

propta Seed - best sown as soon as possible in a greenhouse. Germination can be erratic but usually takes place within 20 - 60 days at 20°c[164]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out in late spring or early summer after the last expected frosts. Root cuttings, 6 - 8cm long, December in a greenhouse. High percentage [78]. Division of suckers in the

dormant season. Very easy, they can be planted out direct into their permanent positions if required.

nwatta Landscape Uses: Arbor, Container, Specimen. Succeeds in a sunny position in ordinary garden soil[1, 200] but prefers a fertile humus-rich well-drained soil[164, 200]. The soil must not be allowed to dry out in the growing season[1]. Requires a position sheltered from cold drying winds[1, 200]. Plants are hardy to about -10°c[184], they can be cut to the ground in severe winters but usually resprout from the base, especially if they have been well mulched, they will then flower in late summer[11, 182, 200]. Plants succeed in an open position at Wisley in Surrey[11]. Spreads rapidly by suckers[11]. Flowers are produced on the current seasons growth[200]. They have a delicious scent[245]. The leaves are foetid when crushed[182]. Special Features:Attractive foliage, Fragrant foliage, Not North American native, Fragrant flowers.

# 8.2.464 Eucalyptus delegatensis

7 tlin 11 cvuc 0 kcak 3 tcan 3 dwat 40 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Eucalyptus delegatensis is an evergreen Tree growing to 40 m (131ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Bees, Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

pcista Citronellal, an essential oil found in most Eucalyptus species is reported to be mutagenic when used in isolation[269]. In large doses, oil of eucalyptus, like so many essential oils has caused fatalities from intestinal irritation[269]. Death is reported from ingestion of 4 - 24 ml of essential oils, but recoveries are also reported for the same amount[269]. Symptoms include gastroenteric burning and irritation, nausea, vomiting, diarrhoea, oxygen deficiency, weakness, dizziness, stupor, difficult respiration, delirium, paralysis, convulsions, and death, usually due to respiratory failure[269].

tcanta An essential oil is obtained from the leaves. Total quantity of the oil, and its composition, can vary widely from plant to plant, but we have reports that the fresh leaves contain around 1.8 - 3.9% (2.5 - 5.6% dry weight) essential oil. The main components include phellandrene, cymene, pperitone, methyl cinnamate and eudesmol[1659]. The heartwood is pale brown, straw-coloured or pinkish; the 30mm thick band of sapwood is almost white. The wood is opentextured, straight-grained, with conspicuous growth rings. It bends fairly well, is easily worked and polishes well. An excellent timber, it is widely in construction, for purposes such as building framing, flooring, plywood and veneers, furniture, panelling, turnery, handles and pulp for hardboard and paper[1097, 1658]. Eucalypts are culturally important to the Indigenous Australians for a great variety of uses and meanings (Neyland, M. 2010. Eucalyptus delegatensis

dwatta Eucalyptus leaves are a traditional Aboriginal herbal remedy. The essential oil found in the leaves is a powerful antiseptic and is used all over the world for relieving coughs and colds, sore throats and other infections[254]. The essential oil is a common ingredient in many over-thecounter cold remedies[254]. The plant is an aromatic, astringent, tonic herb that sticks to the teeth and turns the saliva red[238]. The report says that the leaves, essential oil and oleo-resin are used[238], but does not specify which properties apply to the different parts of the plant[K]. The leaves and the oil will have very similar properties, the oil being much stronger in its effect since it is distilled from the leaves[K]. Detailed below is how the oleo-resin and oil are commonly used in other species [K]. The essential oil obtained from various species of eucalyptus is a very powerful antiseptic, especially when it is old, because ozone is formed in it on exposure to air. It has a decided disinfectant action, destroying the lower forms of life[4]. The oil can be used externally, applied to cuts, skin infections etc, it can also be inhaled for treating blocked nasal passages, it can be gargled for sore throat and can also be taken internally for a wide range of vest the shoots with plenty of underground stem when they are about 8 - 10cm above the ground. Pot them up into individual pots and keep them in light shade in a cold frame or greenhouse until they are rooting well. Plant them out in the summer.

nwatta Requires a rather dry, warm, well-drained soil in full sun, but is not fussy as to soil type, thriving on chalk[1, 271. Prefers slightly alkaline conditions[200]. Established plants are drought tolerant[190]. This species is not very hardy outdoors in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. A hybrid species, O. dictamnus x O. sipyleum[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.409 Phlomis lychnitis

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Phlomis lychnitis is a deciduous Shrub growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist

kcakta Edible Parts: Edible Uses: CondimentThe plant is sometimes used to adulterate sage, Salvia officinale 177, 1831.

nrakta S.W. Europe. ksacta Rocky places, garigue and open woods, mainly on calcareous soils[89].

propta Seed - sow spring in a greenhouse and only just cover the seed. Germinates guickly. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring or autumn[200].

nwatta Requires a well-drained dry soil in full sun[187] with shelter from cold winds[200]. Plants are hardy to about -10°c[187]. The plant spreads by means of underground suckers[187]. Plants in this genus are notably resistant to honey fungus[200].

#### 8.2.410 Kinugasa japonica

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Kinugasa japonica is a PERENNIAL growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: FruitEdible Uses: Fruit[200]. No more details are given.

nrakta E. Asia - Japan. ksacta Humus-rich soils in woodlands, N. Japan [58, 200].

propta Seed - best sown in a shaded cold frame as soon as it is ripe[134, 200]. Stored seed should be sown in late winter or early spring. Seed usually germinates within 1 -3 months at 15°c. Another report says that seeds produce a root after the first cold stratification but no shoot is produced until after a second winter[138]. The seedlings are prone to damp off and must therefore be given plenty of fresh air[138]. The young plants need to be overwintered in a cold frame for the first year and can then be planted out in late spring. It is very important that the pots become neither too dry nor too wet[138]. Division with care when the plants die down after flowering[200].

nwatta Prefers a deep well-drained woodland or humusrich soil in a somewhat shady position that remains moist

cuttings of young barren shoots in June. Very easy. Har- in the summer[1, 42]. Prefers a neutral to slightly acid soil[200]. Grows well in open woodland[1]. Succeeds in a sunny position if the soil does not dry out[42]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Any transplanting is best done whilst the plants are in flower[200]. Plants can flower in two years from seed[138].

## 8.2.411 Bromus iaponicus

Japanese Chess, Field brome

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.8 m hkuc hmimhtut cyutli kyuctcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Bromus japonicus is a ANNUAL/BIENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

kcakta Edible Parts: Leaves SeedEdible Uses: Leaves[177]. No more details. Seed[177, 179]. No more details are given, but the seed is very small and fiddly to utilize[K]

nrakta S. Europe - Mediterranean, to E. Asia. Introduced and naturalized in most areas of N. America. ksacta Fields and waste places, British Columbia, Alberta and Quebec[204]

propta Seed - sow spring or autumn in situ and only just cover. Germination should take place within 2 weeks. If seed is in short supply it can be surface sown in a cold frame in early spring. When large enough to handle, prick out the seedlings into individual pots and plant them out in early

nwatta Succeeds in a sunny position in most welldrained soils[138, 200].

### 8.2.412 Gladiolus cruentus

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.9 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gladiolus cruentus is a CORM growing to 0.9 m (3ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

kcakta Edible Parts: FlowersEdible Uses: Flowers raw or cooked. Added to salads or used as a boiled vegetable[183].

nrakta S. Africa - Drakensburg Mountains. ksacta Not known

propta Seed - sow early spring in a greenhouse at 15°c[200]. It usually germinates freely[1]. The seed can also be sown as soon as it is ripe in the autumn in a warm greenhouse[200]. Sow the seed thinly so that the seedlings can be grown on in the pot without disturbance for their first year. giving them an occasional liquid feed to ensure they do not become nutrient deficient. Pot up the small bulbs when they are dormant in the autumn, placing about 2 - 3 bulbs in each pot. Grow them on for another year or two in the greenhouse and then plant them out in late spring. Division. Dig up the corms in October, dry them in well ventilated conditions at about 20°c and then store them in a cool but frostfree place over the winter, planting them out about 10cm deep in April[1, 200]. Cormlets harvested when digging up the corms in the autumn can be stored in a similar manner to the corms[200]. Larger cormlets can be planted out in spring, smaller ones may be best grown on for a year in the greenhouse.

nwatta Prefers a sunny sheltered position in a light sandy neutral to slightly acid soil with a pH between 6.5 and 7[1, 200]. Requires a stony gritty loam. This species is not

atures down to between -5 and -10°c[200]. This species is immune to the predations of rabbits[233]. one of the parents of the cultivated garden gladiolas[200].

# 8.2.413 Cynoglossum grande

Pacific Hound's Tongue

7 tlin 10 cyuc 1 kcak 0 tcan 1 dwat 0.8 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Cynoglossum grande is a PERENNIAL growing to 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from April to May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

kcakta Edible Parts: RootEdible Uses: Root cooked[105, 161, 257].

dwatta Poultice Stomachic VDThe grated root has been used as a dressing on inflamed burns and scalds[257]. The root has been used in the treatment of stomach aches and venereal diseases[257].

nrakta Western N. America - British Columbia to California. ksacta Woods[60].

propta Seed - sow autumn, late winter or spring in a greenhouse. The seed usually germinates within 1 - 3 weeks at 20°c. Plant out in mid spring or in the autumn[164]. The seed is best sown in situ according to another report[1].

nwatta Prefers a deep fertile well-drained but moisture retentive soil[200]. Succeeds in well-drained ordinary garden soil[1]. Tolerates light dappled shade[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200].

#### 8.2.414 Sedum sediforme

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasilutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Sedum sediforme is an evergreen Perennial growing to 0.5 m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista Although not poisonous, if large quantities of this plant are eaten it can cause a stomach upset[62, 85].

kcakta Edible Parts: LeavesEdible Uses: Leaves -

nrakta Europe - Mediterranean. ksacta Rocks, walls and stony places, largely on calcareous soils and clay[89].

propta Seed - surface sow in spring in well-drained soil in a sunny position in a greenhouse. Do not allow the soil to dry out. Prick out the seedlings into individual pots when they are large enough to handle. If sufficient growth is made, it is possible to plant them out during the summer, otherwise keep them in a cold-frame or greenhouse for their first winter and plant them out in early summer of the following year[K]. Division is very easy and can be carried out at almost any time in the growing season, though is probably best done in spring or early summer. Larger divisions can be planted out direct into their permanent positions. We have found it best to pot up the smaller divisions and grow them on in a lightly shaded position in a cold frame, planting them out once they are well established in the summer.

nwatta Succeeds in most soils[188] but prefers a fertile well-drained soil in a sunny position[200]. Established plants are very drought tolerant[200]. They grow well in dry soils and can be grown on a wall[200]. This species is not hardy in the colder areas of Britain, it tolerates temperatures down to between -5 and -10°c[200]. A polymorphic plant, it is very variable in size[1]. All members of this genus are said to have edible leaves, though those species, such as this one, that have yellow flowers can cause stomach upsets if they

hardy in the colder areas of the country, it tolerates temperare eaten in quantity[62, 85]. Plants in this genus seem to be

#### 8.2.415 Bloomeria crocea

be eaten raw at any time of the year[257].

Golden Stars, Common goldenstar

hpa7tmwatli xre7t hjonli

7 tlin 10 cyuc 1 kcak 0 tcan 0 dwat 0.3 m hkuc htut cyutli tcup hwicli hrasjlut hpa7tli flatpriklwis

drutta Bloomeria crocea is a BULB growing to 0.3 m (1ft) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers

well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers kcakta Edible Parts: RootEdible Uses: Bulb[177]. It can

tcanta The bulbs can be rubbed on metate into an adhesive and spread on seed gathering baskets to close the interstices[257]. No explanation is given of what metate is. There is a bamboo plant with this common name, but it is not native

nrakta South-western N. America - California. ksacta Dry flats, hillsides, often in heavy soil, chaparral, coastal sage scrub, valley grasslands, oak woodlands from sea level to 1700 metres[71, 270].

propta Seed - sow as soon as it is ripe or February/March in a well-drained compost in the greenhouse. Germination usually takes place within 1 - 3 months at 15°c[134]. Sow the seed thinly so that it can be grown on in the pot without disturbance for the first year, but apply an occasional liquid feed to ensure the plants do not become nutrient deficient. Pot up the small bulbs when they are dormant, putting 2 - 3 bulbs in each pot, and grow them on in a cold frame for another 2 years[134] before planting them out in the autumn when they are dormant. Division of flowering size offsets in the autumn. They are freely produced [200]. The larger bulbs can be planted straight out into their permanent positions if required, whilst it is best to pot up the smaller bulbs and grow them on for a year in a cold frame before planting them out in the autumn.

nwatta Requires a well-drained rich sandy loam and a warm position[1, 138]. Likes plenty of moisture when in growth[200], but plants should be kept quite dry from when the foliage dies down until the autumn[138]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This genus is closely related to Brodiaea and Nothoscordum species[1,

#### 8.2.416 Aristolochia tomentosa

Dutchman's Pipe, Woolly dutchman's pipe 7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 10 m hkuc hmimhtut cyutli kyuctcup hwicli hrasilutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Aristolochia tomentosa is a PERENNIAL growing to 10 m (32ft) by 1 m (3ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil

pcista We have no specific details for this species but most members of this genus have poisonous roots and stems[179]. The plant contains aristolochic acid, this has received rather mixed reports on its toxicity. According to one report aristolochic acid stimulates white blood cell activity and speeds the healing of wounds, but is also carcinogenic and damaging to the kidneys[254]. Another report says that it is an active antitumour agent but is too toxic for clinical use[218]. Another report says that aristolochic acid has anti-cancer properties and can be used in conjunction with chemotherapy and radiotherapy and that it also increases the

root is alterative, analgesic, anodyne, antibacterial, antiinflammatory, antiseptic, antispasmodic, astringent, carminative, diuretic, emmenagogue, expectorant, febrifuge, hypotensive, nervine and tonic[218, 238]. The most important ingredient medicinally in the root is paeoniflorin, which has been shown to have a strong antispasmodic effect on mammalian intestines, it also reduces blood pressure, reduces body temperature caused by fever and protects against stress ulcers[250]. It is taken internally in the treatment of menstrual disorders, injuries, high blood pressure, premenstrual tension and liver disorders[238]. It should only be used under the supervision of a qualified practitioner and should not be prescribed for pregnant women[238]. The roots are harvested in the autumn from cultivated plants that are 4 - 5 years old and are boiled before being dried for later use[238]. The roots of wild plants are harvested in the spring or (preferably) in the autumn and are sun-dried for later use[238]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta E. Asia - N.W. China. ksacta Sub-alpine meadows and scrub, also on mountain steppe, 2500 - 3500 me-

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250].

nwatta An easily grown plant, it does best in a deep rich soil, preferably neutral or slightly alkaline[1], doing guite well in sun or light shade[1, 200], and seeming to prefer part shade[233]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. Plants are hardy to about -25°c[187]. A very ornamental[1] and longlived plant, lasting 50 years or more in the garden[200]. This species is closely related to P. anomala, differing mainly in having several flowers to a stem[250]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes[54]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

#### 8.2.460 Adenostoma fasciculatum

Greasewood

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 3 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Adenostoma fasciculatum is an evergreen Shrub growing to 3 m (9ft 10in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers welldrained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It

cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

tcanta Adhesive Basketry Disinfectant Fuel Lighting Soil stabilizationThe wood has been used in basketry[257]. Agum from the plant has been used as a glue[257]. Plants have an extensive spreading root system that helps to bind the soil together. They are planted on slopes and other fragile soils for the prevention of soil erosion[181]. Large roots burn well and have been used for firewood[257]. Branches have been tied together then burnt for use as a torch[257].

dwatta Antirheumatic DisinfectantA decoction of the leaves and branches has been applied externally in the treatment of rheumatism and as a wash for infected, sore or swollen parts of the body[257].

nrakta South-western N. America - California to Mexico. ksacta Poor depleted soils and dry hot slopes in the Chaparrel in Mexico[181]. Dense thickets among the coastal hills of California[200].

propta Seed - we have no information for this species but suggest sowing the seed in a greenhouse in early spring. When large enough to handle, prick the seedlings out into individual pots and grow the plants on for at least their first winter in a greenhouse or cold frame, planting them out in late spring or early summer, after the last expected frosts. Cuttings could be tried in August of half-ripe wood, preferably with a heel, in a frame. Layering.

nwatta Requires a sheltered sunny position in a welldrained soil[182, 200] and protection from cold winds[200]. Plants are not very hardy in Britain and do not withstand exposure to prolonged winter frosts though they succeed outdoors in the milder areas of the country[182, 200]. In colder areas they are best grown against a south or south-west facing wall[200]. The leaves are resinous and catch fire easily[181]. They have a pleasant aroma[200].

## 8.2.461 Nicotiana rustica

Wild Tobacco, Aztec tobacco

7 tlin 10 cvuc 0 kcak 3 tcan 2 dwat 1.5 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Nicotiana rustica is a ANNUAL growing to 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Lepidoptera (Moths and Butterflies). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista All parts of the plant are poisonous[200].

tcanta InsecticideAll parts of the plant contain nicotine. this has been extracted and used as an insecticide. The dried leaves can also be used, they remain effective for 6 months after drying[169]. The leaves have also been dried and then chewed as a stimulant or made into snuff for sniffing, or smoked. This species is more potent than N. tabacum (the species normally cultivated for cigarettes). Dynamic accu-

dwatta Antispasmodic Emetic Narcotic SedativeAll parts of the plant contain nicotine which is a strong narcotic[192]. The leaves are antispasmodic, cathartic, emetic, narcotic and sedative[240, 257]. They are used externally as a poultice and a wash in the treatment of rheumatic swelling. skin diseases and scorpion stings[240].

nrakta S. America - Ecuador to Bolivia, ksacta The original habitat is obscure. Plants are naturalized in Eastern N. America where they grow in waste places, open areas

propta Seed - surface sow in a warm greenhouse about 10 weeks before the last expected spring frosts. The seed usually germinates in 10 - 20 days at 20°c. Keep the soil moist and pot up as soon as the plants are big enough to handle, planting them out after the last expected frosts.

nwatta Prefers a well-drained deep rich moist soil in a sunny position[1, 200]. This plant was formerly cultivated for its use as an insecticide but it has now been largely replaced by N. tabacum[46, 50, 200]. Plants require more than 14 hours daylight per day in order to induce flowering[169].

purgative[240]. They have proved useful in the treatment of rheumatism and syphilis[240]. The bark is febrifuge[240].

nrakta E. Asia - Himalayas from Afghanistan to C. Nepal. ksacta Steep shady rocky ravines, often gregarious, 1800 - 2700 metres[51, 184].

propta Seed - stratification is not necessary but can lead to more regular germination[113]. The seed is best sown in a cold frame as soon as it is ripe[138]. Sow stored seed as early in the year as possible in a cold frame. It usually germinates in 1 - 3 months at 15°c but stored seed can take longer[138]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter, planting them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of short side shoots with a heel, September in a frame [200]. Difficult[182, 200]. Nodal cuttings in spring in a frame. Difficult[200].

nwatta Succeeds in almost any soil that is well-drained[11, 200]. Tolerates light shade and chalky soils[1, 200]. Tolerates a pH range from 5.5 to 7.4[200]. This species is perfectly hardy in much of Britain[11], tolerating temperatures down to about -10°c[184], but it is very slow growing[182]. The foliage is pungently scented, especially when wet[245].

# 8.2.457 Ilex pubescens

 $7 ext{ tlin } 10 ext{ cyuc } 0 ext{ kcak } 0 ext{ tcan } 2 ext{ dwat } 3.5 ext{ m hkuc}$ hmimhtut cyutli tcup hwicli hrasjlutnyik hpa $7 ext{tlin } 10 ext{ tlin } 10 ext{ m}$ hpa $7 ext{tlin } 10 ext{ m}$ hjonli

drutta llex pubescens is an evergreen Shrub growing to 3.5 m (11ft 6in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May, and the seeds ripen from October to November. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

dwatta Antibacterial Antiinflammatory Antitussive Cardiac Expectorant Febrifuge Hypotensive VasodilatorThe root is anti-inflammatory, antitussive, depurative, expectorant and febrifuge[176]. It causes a strong and persistent dilation of the blood vessels, increasing the blood flow to the coronary artery, lowering blood pressure and reducing oxygen consumption of the cardiac muscles[176]. It is used in the treatment of Buerger's disease, angina pectoris, acute myocardial infarction, tonsillitis, acute bronchitis with cough and sputum, hypertension[176]. It has an antibacterial action against both gram positive and negative bacilli[176]. The plant is vasodilator, hypotensive. It has been used successfully in the treatment of severe chest pains due to coronary problems[218].

nrakta E. Asia - S. China. ksacta Evergreen broad-leaf forests, forest margins, shrubby areas, streamsides and road-sides at elevations of 100 - 1000 metres[266].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a

shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years.

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Another report says that the plant only tolerates temperatures down to about -3°c[260]. Resents root disturbance, especially as the plants get older III. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

## 8.2.458 Datisca cannabina

Acalbir, Akalbir

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 1.8 m hkuc

htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta Datisca cannabina is a PERENNIAL growing to 1.8 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in September, and the seeds ripen in October. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

tcanta DyeA yellow dye is obtained from the leaves, root and stems[46, 61, 145].

dwatta Bitter Diuretic Febrifuge Odontalgic Purgative SedativeThe leaves and flowering stems are bitter, diuretic, febrifuge and purgative[145, 240]. The root is used as a sedative in the treatment of rheumatism[240]. It is also applied to carious teeth[240].

nrakta S. Europe (Crete), to W. Asia. ksacta Banks of streams in rich alluvial soils[50, 200].

propta Seed - sow spring in a greenhouse, only just covering the seed. Germination usually takes place within 1 - 3 weeks at 18°c[164]. When large enough to handle, prick the seedlings out into individual pots and plant them out in the summer. Division in the spring. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the spring

nwatta Requires a good deep soil and a sunny position[1, 200]. Plants can be grown in quite coarse grass, which can be cut annually in the autumn[233]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Give the roots protection from winter frosts by mulching them[200]. At one time this plant was commonly cultivated as a dye plant[46, 61], but with the advent of chemical dyes it has fallen into disuse. Dioecious. Male and female plants must be grown if seed is required.

#### 8.2.459 Paeonia veitchii

7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat 0.8 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Paeonía veitchií is a PERENNIAL growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Analgesic Antibacterial Antiinflammatory Antispasmodic Diuretic Febrifuge SedativeThe whole root is used in Chinese medicine, its name is Chi Shao Yoa[250]. The cellular immunity and phagocytosis function of the phagocytic cells[176].

dwatta Antidote Bitter Diaphoretic Expectorant Febrifuge Odontalgic Stimulant TonicThis species has medicinal activity that is similar to but weaker than A. serpentaria[222], - these activities are listed below[K]. The Virginia snakeroot is attracting increasing interest for its medicinal virtues and as a result is becoming uncommon in the wild. It merits consideration for cultivation in forest areas[222]. It is used in a number of proprietary medicines for treating skin, circulatory and kidney disorders[238]. The plant contains aristolochic acid which, whilst stimulating white blood cell activity and speeding the healing of wounds, is also carcinogenic and damaging to the kidneys[254]. The root is harvested in the autumn and dried for later use[238]. The root is antidote, anti-inflammatory, bitter tonic, diaphoretic, diuretic and stimulant[1, 2, 4, 21, 46, 200]. Traditionally it was chewed in minute doses or used as a weak tea to promote sweating, stimulate the appetite and promote expectoration[4, 222]. The native North Americans considered it to have analgesic properties and used an infusion internally to treat rheumatism, pain - but especially sharp pains in the breast, and as a wash for headaches [257]. This plant should be used with caution, it is irritating in large doses and can cause nausea, griping pains in the bowels etc[4, 21, 222]. It should only be used internally under the supervision of a qualified practitioner[238]. The bruised root is placed in hollow teeth for treating toothache[207]. An extract of the root can be drunk to relieve stomach pains[207]. The boiled root, or a decoction of the whole plant, can be used to treat fevers[213]. The chewed root or crushed leaves was applied to snakebites[207, 213]. This species was the most popular snakebite remedy in N. America[213]. It has also been applied externally to slow-healing wounds and in the treatment of pleurisy[238].

nrakta South-eastern N. America - North Carolina too Florida, west to Texas, Kansas and Illinois. ksacta Moist woods[200] along rich river banks[222]. Thickets and wods, in sandy and silty soils[274].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Pre-soak stored seed for 48 hours in hand-hot water and surface sow in a greenhouse[134]. Germination usually takes place within 1 - 3 months at 20°c[134]. Stored seed germinates better if it is given 3 months cold stratification at 5°c[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer after the last expected frosts. Division in autumn[200]. Root cuttings in winter[200].

nwatta Prefers a well-drained loamy soil, rich in organic matter, in sun or semi-shade[1, 200], but succeeds in ordinary garden soil[134]. Plants are hardy to at least-10°c[200]. A fast-growing climbing plant, attaching itself by means of twining around other plants, it has been recommended for covering pergolas[200]. Most species in this genus have malodrous flowers that are pollinated by flies[200].

#### 8.2.417 Paeonia mascula

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat m hkuc hmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli fvifxre7t hionli

drutta Paeonia mascula is a PERENNIAL growing to 1 m (3ft 3in) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower in May. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

dwatta Antispasmodic Antitussive TonicThe root is antispasmodic and tonic[4, 46, 61]. A tea made from the dried crushed petals of various peony species has been used as a cough remedy, and as a treatment for haemorrhoids and varicose veins[250].

nrakta N.W. Africa. Naturalized in Britain. ksacta Bushy places in meadows and hills[89]. Oak, pine and beech forest, often amongst bracken, or on rocky limestone slopes that are north-facing[187].

propta Seed - best sown as soon as it is ripe in a cold frame[250]. When sown fresh, the seed produces a root about 6 weeks after sowing with shoots formed in the spring[200]. Stored seed is much slower, it should be sown as soon as possible in a cold frame but may take 18 months or more to germinate[200]. The roots are very sensitive to disturbance, so many growers allow the seedlings to remain in their pots for 2 growing seasons before potting them up. This allows a better root system to develop that is more resilient to disturbance[250]. If following this practice, make sure you sow the seed thinly, and give regular liquid feeds in the growing season to ensure the plants are well fed. We usually prick out the seedlings into individual pots as soon as they are large enough to handle, and then grow them on in a cold frame for at least two growing seasons before planting them out when they are in growth in the spring[K]. Division with great care in spring or autumn. Each portion must have a leaf bud. If the lifted root is stood in shade for several hours it becomes less brittle and easier to divide[200]. Divisions that have several buds will usually flower in the second year, but those that only have one or two buds will take a number of years before they have grown sufficiently to flower[250]. nwatta Requires a deep rich soil, preferably neutral or

slightly alkaline[1], doing quite well in sun or light shade[1, 200]. Plants are tolerant of a wide range of soil conditions, but will not survive if the soil becomes waterlogged or is too dry[250]. This species is lime tolerant[200]. Plants grown on sandy soils tend to produce more leaves and less flowers, whilst those growing on clay take longer to become established but produce better blooms[250]. The sub-species P. mascula mascula succeeds in dry soils, its roots are subject to slug damage in moist soils[187]. The sub-species P. mascula hellenica. Tzanoudakis. comes into growth early in the year and may require protection from late frosts[187]. Plants are generally hardy to about -15°c[187], though some forms, especially the sub-species P. mascula hellenica, might need frost protection[250]. A very ornamental[1] and longlived plant, living for 50 years or more in the garden[200]. A polymorphic species, there are at least 5 recognised subspecies[200, 250]. This species was cultivated as a medicinal plant in the Middle Ages[250]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. A very greedy plant inhibiting the growth of nearby plants, especially legumes. A polymorphic species, there are a number of sub-species[187]. Strongly resents root disturbance, taking some time to recover after being divided[1]. Peony species are usually self-fertile, though they will also hybridise with other species if these flower nearby at the same time[250]. Plants take 4 - 5 years to flower from seed[200]. They generally breed true from seed[1].

## **8.2.418** Vinca major

Greater Periwinkle, Bigleaf periwinkle, Myrtle, Large Periwinkle, Big Periwinkle

7 tlin 9 cyuc 0 kcak 0 tcan 3 dwat m hkuc

pcimhmimhtut cyutli hgatkyuctcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Vinca major is an evergreen Shrub growing to 0.5 m (1ft 8in) by 1 m (3ft 3in) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 4 and is not frost tender. It is in leaf all year, in flower from April to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista Large quantities of the plant are poisonous[19,

tcanta BasketryThe stems are used in basket making[7]. A very good ground cover for covering steep banks and shady places, spreading rapidly once established and forming a dense cover within 2 years[11, 28, 31, 190, 200]. It is less dense on dry or exposed sites[197]. Plants are best spaced about 60cm apart each way[208].

dwatta Astringent Bitter Detergent Homeopathy Hypotensive Purgative Sedative Stomachic Tonic VasodilatorThe plant is astringent, bitter, detergent, sedative, stomachic and tonic[4, 7, 21, 53, 165, 238]. It contains the alka-

loid 'vincamine', which is used by the pharmaceutical industry as a cerebral stimulant and vasodilator[238]. It also contains 'reserpine', which reduces high blood pressure[238]. It is used internally in the treatment of excessive menstruation, abnormal uterine bleeding, vaginal discharge and hardening of the arteries[238]. It should not be given to patients with constipation[238]. It is applied externally to vaginal discharge, nosebleed, sore throat and mouth ulcers[238]. The plants are cut when flowering and dried for later use[238]. The fresh flowers are gently purgative, but lose their effect on drying[4]. A homeopathic remedy is made from the fresh leaves[4]. It is used in the treatment of haemorrhages[4].

nrakta C. and S. Europe, N. Africa. Naturalized in Britain. ksacta Copses and hedgerows in S. England[17].

propta Seed - we have no information on this species but suggest sowing the seed in a cold frame as soon as it is ripe if possible. Sow stored seed in late winter in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in spring just before active growth commences[78], or in autumn[1]. Larger divisions can be planted out direct into their permanent positions. We have found that it is best to pot up smaller divisions and grow them on in light shade in a greenhouse or cold frame until they are growing away well. Plant them out in the summer or the following spring. Cuttings of mature wood of the current seasons growth, 5 - 10 cm long, October in a cold frame. Roots quickly. High percentage[78].

nwatta Landscape Uses:Border, Container, Erosion control, Ground cover, Massing, Specimen. A very easily grown plant, it succeeds in almost any soil[200] but prefers those that are on the richer side[17]. Grows well in heavy clay soils. Plants are very shade tolerant but they do not flower so well in deep shade[11, 28, 31]. They grow well under deciduous trees[187], and in such a situation can succeed in dry soils[190]. Established plants are drought tolerant[190]. A very ornamental[1] and polymorphic plant[200], there are some named forms selected for their ornamental value[187]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233]. This species rarely if ever sets seed in Britain[4]. It spreads rapidly by long trailing stems that root at their tips and leaf nodes, it can be invasive[4, 238]. Once it is established it will swamp out smaller plants[4]. Special Features: Attractive foliage, Not North American native, Naturalizing, Attractive flowers or blooms.

#### 8.2.419 Narcissus tazetta

Bunchflower Daffodil, Cream narcissus 7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 0.5 m hkuc htut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Narcissus tazetta is a BULB growing to 0.5 m (1ft 8in) by 0.1 m (0ft 4in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from January to February. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers moist soil

tcanta EssentialAn essential oil obtained from the flowers is used in perfumery[171].

dwatta Analgesic Antiphlogistic Cancer Demulcent Emetic PoulticeDemulcent[174, 178]. Used in the treatment of boils and mastitis[174]. The root is emetic[240]. It is used to relieve headaches[240]. The chopped root is applied externally as an antiphlogistic and analgesic poultice to abscesses, boils and other skin complaints[218]. The plant has a folklore of effectiveness against certain forms of cancer. This might be due to benzaldehyde changing to laetrile-like compounds or to lycorine changing to lycobetaine-like compounds in the body[218].

nrakta Europe to E. Asia. ksacta Fields, meadows and garigue, especially in damp places, in the Mediterranean [89].

propta Seed - best sown as soon as it is ripe in a cold frame. A short stratification will improve the germination of

stored seed. Sow the seed thinly so that the seedlings can be left undisturbed in the pot for their first two years of growth. Give them an occasional liquid feed in the growing season to ensure they do not become nutrient deficient. When the plants become dormant in the summer, pot up the small bulbs placing 2 - 3 bulbs in each pot. Grow them on for another one or two years in the greenhouse before planting them out when they are dormant in late summer. Division of bulbs after the leaves die down in early summer[1]. Larger bulbs can be replanted immediately into their permanent positions, or can be stored in a cool place and then be planted out in the autumn. It is best to pot up the smaller bulbs and grow them on for a year before planting them out when dormant in the autumn.

nwatta Prefers a deep rather stiff soil but succeeds in most soils and situations[1]. Grows well in heavy clay soils. Prefers an alkaline soil with a pH between 7 and 8[200]. Best grown in a warm sunny corner with shelter from cold winds[245]. The dormant bulbs will withstand soil temperatures down to at least -5°c[214]. A polymorphic species[200]. Cultivated for its essential oil[171]. The flowers are very powerfully scented[245]. The sub-species N. tazetta chinensis. Roemer, is used in Japanese medicine[174].

#### 8.2.420 Fabiana imbricata

Pichi

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 2.5 m hkuc htut cyutli tcup hwicli hras hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Fabiana imbricata is an evergreen Shrub growing to 2.5 m (8ft) by 2.5 m (8ft). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

dwatta Cholagogue Diuretic Tonic UrinaryThe dried leaves and twigs are cholagogue, a valuable terebinthic diuretic and tonic[4]. It is largely used in the treatment of acute urinary bladder catarrh, giving very favourable results where urinary irritation where irritation is caused by gravel[4]. It is contra-indicated where there is organic disease of the kidneys[4].

nrakta S. America - Chile. ksacta Not known

propta Seed - sow in a well-drained sandy soil in the greenhouse(200). When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Greenwood cuttings, rooted with gentle bottom heat, summer in a cold frame[200].

nwatta Succeeds in a sunny position in a light welldrained soil[200]. Plants are not very hardy in Britain, growing best in areas that receive little or no frost[200]. The cultivar 'Violacea' is generally faster growing and is somewhat hardier than the type, tolerating temperatures down to about -5°c[200].

## 8.2.421 Desfontainia spinosa

Taique

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 2.5 m hkuc hmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Desfontainia spinosa is an evergreen Shrub growing to 2.5 m (8ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from August to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

dwatta Miscellany NarcoticThe leaves are narcotic and have been used medicinally in Chile[192]. More research needs to be carried out into the medicinal virtues of this plant[192]. The sub-species D. spinosa hookeri is usually employed[192].

and moist[11]. Strongly resents dryness at the roots during the growing season[125]. Requires a sheltered position when grown in the colder areas of the country[200]. This species is hardy to about -10°c[184], succeeding outdoors in the milder areas of Britain south and west of London[11]. The leaves and young shoots are very resinous[11]. The honey-like perfume of the flowers pervades the air for some considerable distance[245]. Hybridizes with other members of this genus[200]. A good bee plant[156, 166]. Some named forms have been selected for their ornamental value[184].

## 8.2.454 Asplenium ceterach

Scale Fern

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 0.2 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlut hpa7tli lwisslip hpa7tmwatli hjonli

drutta Asplenium ceterach is a FERN growing to 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. The seeds ripen from April to October. Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although we have found no reports of toxicity for this species, a number of ferns contain carcinogens so some caution is advisable[200]. Many ferns also contain thiaminase, an enzyme that robs the body of its vitamin B complex. In small quantities this enzyme will do no harm to people earling an adequate diet that is rich in vitamin B, though large quantities can cause severe health problems. The enzyme is destroyed by heat or thorough drying, so cooking the plant will remove the thiaminase[172].

dwatta Antitussive DiureticThe whole plant is antitussive and diuretic[7]. It is widely used in the Mediterranean to treat gravel in the urine and is also used with other mucilaginous plants to treat bronchial complaints[7]. The taste is very bitter and needs to be sweetened with other herbs such as liquorice[7]. The plant is harvested from late spring to sumer and can be dried for later use[7]. Some caution should be employed in its use since it has not been fully tested[7].

nrakta Central and southern Europe, including Britain, east to the Himalayas and Caucasus. ksacta Limestone rocks and mortared walls[17].

propta Spores - best sown as soon as they are ripe on the surface of a humus-rich sterilized soil. Keep the compost moist, preferably by putting a plastic bag over the pot. Germinates in springf1]. Spring sown spores germinate in 1 - 3 months at 15°c134]. Pot on small clumps of plantlets as soon as they are large enough to handle and grow them on in light shade in a cold frame or greenhouse. Keep them humid until they are well established. When they are at least 15cm tall, plant them out into their permanent positions in late spring or early summer.

nwatta A calcicole plant, it requires a freely draining but moist alkaline soil[1]. It tolerates full sun but prefers a position with at least part-day shade[200] and also grows in deep shade[219]. Plants can be grown in old brick walls[219]. A very ornamental plant[1]. Members of this genus are rarely if ever troubled by browsing deer[233].

# 8.2.455 Cypripedium acaule

Nerve Root, Moccasin flower, Ladyslipper Orchid, Pink Lady's Slipper

7 tlin 11 cyuc 0 kcak 0 tcan 3 dwat 0.4 m hkuc

hmim cyutli tcup hwicli hrasjlutnyik hpa7tli frusflatprik hpa7tmwatli xre7t hjonli

drutta Cypripedium acaule is a PERENNIAL growing to 0.4 m (1ft 4in) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 5. It is in flower from May to June. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils and can grow in very acid soils. It can grow in semi-shade (light woodland). It prefers moist soil.

pcista Contact with the fresh plant can cause dermatitis in sensitive people[1, 21]. Hairs on the leaves can cause a rash similar to poison ivy rash in some people[213].

dwatta Antispasmodic Kidney Nervine Sedative Tonic UrinaryThe root is antispasmodic, nervine, sedative, tonic[207, 222]. It is said to be the equivalent of Valerian, Valeriana officinalis, in treating nervous complaints, sleeplessness etc[207]. The roots have also been used in the treatment of menstrual disorders, stomach aches, kidney and urinary tract disorders and venereal disease[257]. An infusion of the dried tuber is used, the tubers are harvested in the autumn[213]. The active ingredients are not water-soluble[222].

nrakta Eastern N. America - Nova Scotia to Nebraska, south to Mississippi and Alabama. ksacta Usually found in the higher and dryer parts of coniferous woods, often in a thin layer of pine needles over rocks[230], it is also sometimes found in bogs and wet places[213, 230].

propta Seed - surface sow, preferably as soon as it is ripe, in the greenhouse and do not allow the compost to dry out. The seed of this species is extremely simple, it has a minute embryo surrounded by a single layer of protective cells. It contains very little food reserves and depends upon a symbiotic relationship with a species of soil-dwelling fungus. The fungal hyphae invade the seed and enter the cells of the embryo. The orchid soon begins to digest the fungal tissue and this acts as a food supply for the plant until it is able to obtain nutrients from decaying material in the soil[200]. It is best to use some of the soil that is growing around established plants in order to introduce the fungus, or to sow the seed around a plant of the same species and allow the seedlings to grow on until they are large enough to move. Division with care in early spring, the plants resent disturbance[200]. Remove part of the original rootball with the soil intact[200]. Division is best carried out towards the end of the growing season, since food reserves are fairly evenly distributed through the rhizome[230]. Small divisions of a lead and two buds, or divisions from the back (older) part of the rhizome without any developed buds, establish quickly using this method[230]. Replant immediately in situ[230].

nwatta Landscape Uses:Container, Woodland garden, Requires a position in semi-shade on a damp acid soil that is rich in humus[200]. Plants grow well in a woodland garden or shady border[230]. Orchids are, in general, shallow-rooting plants of well-drained low-fertility soils. Their symbiotic relationship with a fungus in the soil allows them to obtain sufficient nutrients and be able to compete successfully with other plants. They are very sensitive to the addition of fertilizers or fungicides since these can harm the symbiotic fungus and thus kill the orchid[230]. Resents root disturbance[200]. A very ornamental plant[207], it is guite difficult in cultivation and plants will often flower well in their first year then disappear[230]. This is possibly because the plants are sold bare-rooted and do not have the necessary fungal symbiant they need in order to thrive[230]. Only buy pot-grown plants in order to try and ensure that the symbiant is present[K]. The plants are subject to damage by slugs[200]. Special Features:North American native, Wetlands plant.

### 8.2.456 Buxus wallichiana

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli hjonli

drutta Buxus wallichiana is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Bees, flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Hedge Hedge WoodPlants can be grown as a hedge, they are very tolerant of pruning but are slow growning[188]. Wood - hard, fine grained, durable. Used for engraving, fine carving, mathematical instruments etc. It is at least equal in quality to B. sempervirens[11, 51, 61, 145, 150]

dwatta Bitter Diaphoretic Febrifuge PurgativeThe wood is diaphoretic[240]. The leaves are bitter, diaphoretic and

in the treatment of abdominal distension, shortness of breath etc[176, 238]. They are harvested in the summer and can be used fresh or dried[238]. The stem bark is antiseptic, antispasmodic, aphrodisiac, appetizer, diuretic, expectorant, hypotensive, stomachic and tonic[46, 61, 109, 147, 174, 176, 218]. The bark is used internally in the treatment of abdominal distension, loss of appetite, gastro-enteritis, vomiting, diarrhoea, asthma and coughs with acute phlegm[147, 174, 176, 218, 238]. The bark is harvested in the autumn and dried for later use[238]. It does not store well so stocks should be renewed annually[238]. The plant is digestive and stomachic[218]. Extracts of the plant contain bactericidal compounds and an essential oil, they are effective against salmonella[218].

nrakta E. Asia - W. China. ksacta Alpine and hilly areas[147]. Forests at elevations of 300 - 1500 metres[266].

propta Seed - best sown as soon as it is ripe in a cold frame. Stored seed must be kept cold over the winter and should be sown in late winter in a cold frame[200]. The seed usually germinates in the spring but it can take 18 months. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in light shade in a cold frame or greenhouse for at least their first winter. They can be planted out into their permanent positions when they are more than 15cm tall, though should be well mulched and given some protection from winter cold for their first winter or two outdoors. Layering in early spring[2001.

nwatta Best grown in a warm position in a moderately rich free soil of an open texture[1]. The branches are brittle so a sheltered position is required[200]. Very tolerant of atmospheric pollution[200]. Hardy to about -10°c[200]. The fleshy roots are easily damaged and any transplanting is best done during a spell of mild moist weather in late spring[182].

# 8.2.452 Cedrus deodara

Deodar, Deodar cedar 7 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 33 m hkuc htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli hionli

drutta Cedrus deodara is an evergreen Tree growing to 33 m (108ft) by 10 m (32ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from October to November, and the seeds ripen from October to December. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate strong winds but not maritime exposure. It cannot tolerate atmospheric pollution.

tcanta Shelterbelt WoodA fairly wind-tolerant tree, it can be used in shelterbelt plantings[200]. Wood - moderately hard, durable, aromatic, fine and even grained. Resistant to termites, it is used for construction, furniture, boats etc[51, 61, 145, 158, 272]. A valuable timber, but a poor fuel, producing a lot of smoke as it burns[51, 272].

dwatta Antidote Astringent Carminative Diaphoretic Diuretic Dysentery Skin TB UrinaryThe heartwood is carminative, diaphoretic, diuretic and expectorant[240, 272]. A decoction of the wood is used in the treatment of fevers, flatulence, pulmonary and urinary disorders, rheumatism, piles, kidney stones, insomnia, diabetes etc[240, 254]. It has been used as an antidote to snake bites[240, 243]. The plant yields a medicinal essential oil by distillation of the wood, it is used in the treatment of phthisis, bronchitis, blennorrhagia and skin eruptions[4, 158, 240]. A resin obtained from the wood is used externally to treat bruises, skin diseases and injuries to joints[272]. The bark is astringent. It has proved useful in the treatment of fevers, diarrhoea and dysentery[240, 243]. In Ayurvedic medicine the leaves are used in the treatment of tuberculosis[254]. An oil obtained from the seed is diaphoretic[272]. It is applied externally to treat skin diseases[272].

nrakta E. Asia - Afghanistan to Nepal. ksacta Forms forests in the drier areas of the Himalayas at 1800 - 3000 metres[51, 81].

propta Seed - collect the cones in winter and keep in a warm room until they open[1]. Sow immediately in a cold frame[78]. One report says that a short cold stratification of one month improves germination rates[113]. Keep the seed pot moist, but be careful because the young seedlings are very prone to damp off, keep them well ventilated[113]. Prick out the seedlings into individual pots when they are large enough to handle. Grow them on in a cold frame for their first winter and plant them out into their permanent positions in late spring or early summer. Give them some protection from winter cold for their first winter or two outdoors[K]. Cuttings of terminal shoots can be tried in a frame in November but they are very difficult[113].

nwatta Landscape Uses:Espalier, Specimen Thrives on most soils, being very tolerant of dry sites and of drought when it is established[81, 200]. Succeeds in very chalky soils[200]. Prefers a rich loam or a sandy clay in full sun[1]. Succeeds in warm dry areas with less than 40cm of rain a year, but also in areas with cool summers and up to 200cm of rain[200]. Dislikes atmospheric pollution[11]. Plants are fairly wind tolerant[200]. This species is the least hardy of the genus and does not always succeed outdoors in Britain[11] although some clones are hardy down to zone 5 and grow well in this country[200]. The hardiest forms come from the west of its range[81]. Trees thrive best in the cooler and moister areas of Britain[11]. Small trees less than 50cm tall establish much more quickly and better than taller trees, those that are more than 2 metres tall are difficult to establish[200]. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Plants are said to live for up to 600 years in the wild[227]. New growth takes place from May to the end of September and can exceed 1 metre per year, slowing down as the tree gets larger and virtually ceasing by the time the tree is 20 metres tall[185]. This species is sometimes cultivated for timber in some parts of S. Europe[50]. Small male cones are formed on the lower branches of trees, whilst the larger female cones are formed on higher branches[238]. These female cones persist on the tree for 2 - 3 years before breaking up[238]. Trees are notably susceptible to honey fungus[200]. The whole plant is aromatic[245]. Special Features: Attractive foliage. Not North American native. Inconspicuous flowers or

#### 8.2.453 Eucryphia lucida

eatherwood

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 10 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatprik hna7tmwatli xre7t hionli

drutta Eucryphia lucida is an evergreen Tree growing to 10 m (32ft) by 4 m (13ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist

tcanta Hedge HedgeCan be grown as a hedge[157]. dwatta Antiseptic StypticAntiseptic, styptic[152].

nrakta Australia - Tasmania. ksacta Forests, often along river banks, at low altitudes[11, 184].

propta Seed - sow February in a greenhouse. The seed should be stored cool and dry over the winter. Germination is usually good[78]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 6 - 8cm with a heel, June/July in individual pots in a frame. Roots in 5 - 6 weeks. A variable percentage succeed[78]. Layering in late summer. Takes 16 months. High percentage[78].

nwatta Requires an open but sheltered position and a light moist lime-free soil[11, 184]. Succeeds in any free open loamy soil[1]. Prefers its base in the shade with its canopy in the light[200]. Requires plenty of light if it is to flower freely, tolerating almost full sun if the soil is cool

nrakta S. America - Growing in the Andes from Colombia to southern Chile. ksacta Cool mountain cloud forests in the north of its range, descending to sea level in the south[11].

propta Seed - surface sow in spring in a greenhouse. Do not allow the compost to become dry. Grow on the seedlings in a bright filtered light[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Requires humid conditions and bottom heat at 16°c[200]. Overwinter in a cold frame and grow on for another year before planting out[200]. Division of suckers in the dormant season[202].

nwatta Requires a humus-rich moisture-retentive acid soil in a sheltered position in partial shade[200]. Grows well in sandy soils as long as there is plenty of humus present[245]. Intolerant of alkaline soils and of waterlogging[202]. Dislikes drought[200]. Plants like growing with their roots in the shade but their stems reaching up into the light[245]. This species is not fully hardy in Britain, plants tolerate temperatures down to about -10°c when sheltered from cold drying winds[200]. They grow best along the west coast of the country, especially in Scotland and N. Ireland[11]. The sub-species D. spinosa hookeri.(Dun.)Reiche. is usually employed for its medicinal virtues[238]. There is at least one named variety selected for its ornamental value[200]. The flowers are softly honey-scented[245]. A slow-growing plant[202]. Any pruning to retain shape is best done in the spring[200].

# 8.2.422 Cupressus funebris

Chinese Weeping Cypress, Mourning-cypress 7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 25 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli frusflatpriklwis hpa7tmwatli hjonli

drutta Cupressus funebris is an evergreen Tree growing to 25 m (82ft 0in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to May. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very acid soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

tcanta WoodWood - hard, tough, white, durable, close grained. Used for general construction, agricultural implements etc[61, 109].

dwatta AntiperiodicThe leaf is antiperiodic[218]. It is used in the treatment of bleeding piles, excessive menstrual flow etc[218]. A decoction of fruiting branches is used in the treatment of colds[218].

nrakta E. Asia - China. ksacta Forms woods on mountain slopes and ravines, especially in limestone areas, from sea level to 1100 metres[109].

propta Seed - sow late winter in a cold frame and only just cover the seed[164]. Three weeks cold stratification can improve germination rates[164]. The seed usually germinates in 1 - 2 months at 20°c. The seedlings are very subject to damping off so should be watered with care and kept well-ventilated[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can store for several years[113]. Cuttings of almost ripe wood, September in a frost-proof frame[1]. April/May is the best time to take cuttinus[113].

nwatta Thrives in a well-drained loamy or peaty soil[11]. Very tolerant of hot dry conditions[81]. Tolerates poor sandy soils[81] but is then more subject to insect damage in a succession of dry seasons[11]. Requires a sunny position[81]. Prefers a pH of 6 or lower[200]. Somewhat tender in Britain, at least in the north of the country[81], it also seems to be short-lived[185]. Plants do not succeed at Kew[11]. Cultivated as a timber crop in China[61]. Cones can remain closed on the tree for a number of years, opening after the heat of a forest fire to scatter their seeds which then germinate and

grow rapidly in the ashes of the fire[200]. Plants are subject to injury by the wind[11, 81]. Trees are notably susceptible to honey fungus[200]. The crushed foliage has the scent of grass[185].

### 8.2.423 Helichrysum stoechas

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 0.5 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Helichrysum stoechas is a PERENNIAL growing to  $0.5\,\mathrm{m}$  (1ft 8in) by  $1\,\mathrm{m}$  (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

dwatta Deobstruent Diaphoretic Emollient Expectorant-The stem tops and the flowers are deobstruent and expectorant[4]. They have been used in the treatment of colds[4] but their use is now considered to be obsolete[238]. The flowers have been used as diaphoretics and discutients[4].

nrakta S. and W. Europe. ksacta Dry banks, rocks and sands.

propta Seed - sow February/March in a greenhouse. The sed usually germinates in 2 - 3 weeks at 20°c. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, 5cm with a heel, June/July in a frame. Roots in 4 weeks. Good percentage[78].

nwatta Requires a light well-drained soil in a sunny sheltered position[1, 200]. Intolerant of excessive moisture[1]. Established plants are drought resistant[190]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to about -10°c[200]. An aromatic plant with beautiful foliage, there are several named varieties, selected for their ornamental value[200]. Members of this genus are rarely if ever troubled by browsing deer[233].

## 8.2.424 Lobelia tupa

Devil's Tobacco

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Lobelia tupa is a PERENNIAL growing to 2 m (6ft) by 1 m (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from September to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista The whole plant is poisonous[200]. It contains the alkaloid lobeline which has a similar effect upon the nervous system as nicotine[274]. Even smelling this plant has been known to cause sickness[274].

dwatta Narcotic OdontalgicA juice pressed from the leaves is used in the treatment of toothache[192, 238]. The plant is smoked as an intoxicant[192, 200, 238].

nrakta S. America - Chile. ksacta Wooded slopes, in the open and amongst shrubs[192].

propta Seed - best sown as soon as it is ripe in the autumn in a greenhouse[200]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Division in the spring[200]. Plants can also be divided and potted up in the autumn and kept in a cold frame over the winter to protect against losses in severe winters[200].

nwatta Best grown in full sun or in an open position in light shade with some shelter from the wind[200]. Requires a permanently moist fertile loamy soil[200]. This species is

hardy to about -10°c, but in areas with mild maritime winters plants can be induced into early growth and this growth is more susceptible to frost damage[200]. Hybridizes freely with other members of this genus[200].

## 8.2.425 Grindelia camporum

Gumplant, Great Valley gumweed, Bract gumweed 7 tlin 10 cvuc 0 kcak 0 tcan 3 dwat 1.2 m hkuc htut cyutli hgatkyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Grindelia camporum is a ANNUAL/PERENNIAL growing to 1.2 m (4ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate

pcista Large doses used medicinally can irritate the kidnevs[165].

tcanta Adhesive DyeYellow and green dyes are obtained from the flowering heads and pods[168]. Aromatic. A possible substitute for wood rosin, used in the manufacture of adhesives etc[160]. This report probably refers to the resin that covers the flower buds.

dwatta Antiasthmatic Antiinflammatory Antispasmodic Eczema Expectorant Homeopathy SedativeGumplant was used by the native North American Indians to treat bronchial problems and also skin afflictions such as reactions to poison ivy[254]. It is still used in modern herbalism where it is valued especially as a treatment for bronchial asthma and for states where phlegm in the airways impedes respiration[254]. In addition, it is believed to desensitize the nerve endings in the bronchial tree and slow the heart rate, thus leading to easier breathing[254]. The herb is contraindicated for patients with kidney or heart complaints[254]. The dried leaves and flowering tops are antiasthmatic, antiinflammatory, antispasmodic, expectorant and sedative[4, 61, 165, 238]. The principal use of this herb is in the treatment of bronchial catarrh, especially when there is an asthmatic tendency, it is also used to treat whooping cough and cystitis[4, 61, 238]. The active principle is excreted from the kidneys, and this sometimes produces signs of renal irritation[4, 238]. Externally, the plant is used to treat burns, poison ivy rash, dermatitis, eczema and skin eruptions[61, 238]. The plant is harvested when in full bloom and can be used fresh as a poultice or dried for infusions etc[238]. A homeopathic remedy is prepared from the leaves and flowering stems[4]

nrakta Western N. America. ksacta Dry banks, rocky fields and plains, low alkaline ground in California[71].

propta Seed - sow autumn or spring in a cool greenhouse and only just cover the seed. Prick out the plants into individual pots when they are large enough to handle and plant them out into their permanent positions in early summer.

nwatta Succeeds in any well-drained soil in full sun[200]. Does well on dry sandy banks and in poor soils[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. All parts of the plant have a balsamic odour[238].

#### 8.2.426 Papaver argemone

Prickly Poppy, Long pricklyhead poppy 7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 0.4 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Papaver argemone is a ANNUAL growing to 0.4 m (1ft 4in) by 0.2 m (0ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to July, and the seeds ripen from August to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, beetles. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clav) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista This plant is toxic to mammals, though the toxicity is low[76]. The seed is not toxic[76].

dwatta DiaphoreticAn infusion or syrup made from the petals is used as a sudorific[240].

nrakta Central and southern Europe, including Britain. ksacta A common weed of light soils in the south of Britain, becoming rare in the north[17].

propta Seed - sow spring in situ[200].

nwatta Prefers a well-drained sandy loam in a sunny position[1, 200]. Does not do well on wet clay soils but succeeds in most other soils[115]. Plants usually self-sow freely when growing in suitable conditions so long as the soil surface is disturbed[238]. When growing in cereal fields, poppies decrease the yields of nearby cereal plants[18, 20]. Members of this genus are rarely if ever troubled by browsing deer or rabbits[233].

## 8.2.427 Escallonia rubra macrantha

7 tlin 10 cvuc 0 kcak 3 tcan 0 dwat m hkuc

htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Escallonia rubra macrantha is an evergreen Shrub growing to 3.5 m (11ft) by 3 m (9ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from June to October. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil. The plant can tolerate maritime exposure.

tcanta Hedge HedgeVery tolerant of extreme maritime exposure, making a very good windbreak hedge[75]. Tolerant of regular and severe pruning, it can regenerate from the base if cut back by frost[200].

nrakta S. America. - Chile. Plants occasionally self-sow in Ireland[17]. ksacta Not known

propta Seed - we have no details on this plant but suggest sowing the seed in early spring in a cold frame. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a frame. Either put the cuttings in individual pots or pot them up as soon as they start to root. Easy[K]. Cuttings of mature wood in winter. Very easy, just plant the cuttings direct into their final positions, about 95% usually take[29, K]. Keep them moist in a dry spring.

nwatta Prefers an open sunny position and a soil that is not too rich, an ordinary sandy loam will suffice[11]. Succeeds in dry soils. Tolerates lime[200]. A fast-growing plant, it is very tolerant of maritime exposure[184]. A polymorphic species, there are some named varieties. This species is only hardy in the milder areas of Britain, tolerating temperatures down to about -10°c[184]. Plants resent root disturbance and should be placed in their final positions as soon as possible[200]. The leaves and the flowers have a pungent

#### 8.2.428 Hedera nepalensis

1456

7 tlin 10 cvuc 0 kcak 0 tcan 2 dwat 15 m hkuc

pcimhmimhtut cyutli hgattcuphja7n hwicli hyishrasjlutnyikfrip hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Hedera nepalensis is an evergreen Climber growing to 15 m (49ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay and nutritionally poor soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no

fused with E. gunnii to which it is closely allied but from which it is well distinguished by the stalked, urn-shaped fruits on a long common-stalk. Flowers are white in small clusters. Fruit is urn shaped (urceolate) 15 x 9 mm. Can be coppiced. Very hardy tolerating down to -14C to -16C. Tolerates difficult growing conditions including intermittently waterlogged soils and exposed locations. Generation length

#### 8.2.449 Iris foetidissima

Stinking Gladwin, Stinking iris, Gladwin Iris 7 tlin 10 cvuc 0 kcak 0 tcan 2 dwat 1 m hkuc pcimhmimhtut cyutli hgatkyuctcuphia7n hwicli hrasilutnyik hpa7tli flatpriklwisslip hpa7tmwatli fyifxre7t hjonli

drutta Iris foetidissima is an evergreen Perennial growing to 1 m (3ft 3in) by 1.5 m (5ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 6 and is not frost tender. It is in leaf all year, in flower from May to July, and the seeds ripen from October to February. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry moist or wet soil and can tolerate drought. The plant can tolerate maritime

pcista The roots of this plant are toxic to grazing mammals[100]. Plants can cause skin irritations and allergies in some people[238].

tcanta A good ground cover plant, succeeding in dense shade and in dry soils[197]. Rather slow to spread though, needing weeding for the first year or two[197]. Plants should be spaced about 60cm apart each way[208].

dwatta Anodyne Antispasmodic CatharticStinking gladwin has a long history of medicinal use, though it can be rather strong in its action and so is little used nowadays[244]. The root is anodyne, antispasmodic and cathartic[4, 61]. A decoction of the roots acts as a strong purge, it has also been used as an emmenagogue and for cleaning eruptions[4]. The powdered or infused dried root is beneficial in the treatment of fainting, nervous complaints and to relieve pains and cramps[4, 244]. The plant has been used as a cure for ringworm[240].

nrakta Western Europe, including Britain, from France south and east to N. Africa, Italy and Greece. ksacta Open woods, hedgebanks and shady places, usually on calcareous soils[4, 17, 28]. It is often also found on sea cliffs[17].

propta Seed - best sown as soon as it is it is ripe in a cold frame[4]. Stored seed should be sown as early in the year as possible in a cold frame, it may take 18 months to germinate. Prick out the seedlings into individual pots when they are large enough to handle and grow them on in the greenhouse or cold frame for their first year. Plant out into their permanent positions in late spring or early summer. Division, best done in July after flowering. Very easy, larger clumps can be replanted direct into their permanent positions, though it is best to pot up smaller clumps and grow them on in a cold frame until they are rooting well. Plant them out in the

nwatta Landscape Uses:Border, Rock garden, Specimen. An easily grown and very tolerant plant, it succeeds in most positions in any good soil in sun or partial shade[79, 233]. Succeeds in dense shade. Prefers a moist soil[4] but succeeds in dry soils and, once established, is drought tolerant[190]. Thrives in a bog garden[188]. Requires a well-drained soil containing some lime[1] and succeeds on pure chalk[233]. Established plants are tolerant of considerable neglect and can survive dense weed competition[K]. The evergreen leaves are not very hardy, being killed back by cold winds around -15°c[187], though the rootstock is much hardier and the plant soon recovers in spring. A good plant for woodland edges[24]. Plants often self-sow[208, K]. There are some named forms, selected for their ornamental value[190]. The crushed leaves emit a strong odour which, at a distance, resembles hot roast beef[4]. On closer acquaintance the scent becomes disagreeable[4]. Members of this genus are rarely if ever troubled by browsing deer or

rabbits[233]. Special Features: Flowers have an unpleasant odor, Attractive flowers or blooms.

## 8.2.450 Bursaria spinosa

Christmas Bush, Sweet Bursaria

7 tlin 10 cyuc 0 kcak 3 tcan 2 dwat 4.5 m hkuc

htut cyutli tcup hwicli jlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Bursaria spinosa is an evergreen Shrub growing to 4.5 m (14ft 9in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower in August. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. It is noted for attracting wildlife. Suitable for: medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist

tcanta Hedge Hedge Weather protection WoodLeaves contain the coumarin 'aesculin' which is used in the treatment of lupus by irradiation and as an ultraviolet radiation screen in suntan lotions[152]. Plants can be grown as a hedge in mild climates[167]. Wood - tough, hard, close grained, easily worked. Used for tool handles, cabinet mak-

dwatta SkinSkin. The leaves contain the coumarin 'aesculin' - this is used in the treatment of lupus by irradiation and as a screen from ultra-violet light in suntan lotions[152].

nrakta Australia - New South Wales, Tasmania, Victoria. ksacta Forests and open places, but avoiding arid areas[152], in loamy soils, stony hills and on riverbanks[154], probably at its best near the coast[167].

propta Seed - sow spring in a greenhouse. It does not require pre-treatment. When large enough to handle, prick the plants out into individual pots. Grow on the young plants for at least the first winter in a greenhouse and plant out in late spring or early summer. Consider giving the plants some protection from winter cold for at least their first winter outdoors. Cuttings of half-ripe wood, July/August in a frame[219]. They require a little bottom heat if they are to root well[245].

nwatta Requires a well-drained moisture retentive soil in full sun[200]. This species only succeeds outdoors in Britain in the mildest areas of the country[11, 182]. Plants are hardy to at least -7°c in Australian gardens[157], though this cannot be translated directly to British gardens due to our cooler summers and longer, colder and wetter winters. They require a warm south or south-west facing wall in Britain, succeeding in areas where frosts are light and short lived[200]. A good bee plant[167], the flowers are sweetly fragrant[219, 245]. Very ornamental[1].

### 8.2.451 Magnolia officinalis

1465

7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat 20 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Magnolia officinalis is a deciduous Tree growing to 20 m (65ft) by 12 m (39ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from May to June, and the seeds ripen from August to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Beetles. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil. It can tolerate atmospheric pollution.

tcanta WoodWood - fine grained. It is said to be a useful

dwatta Antibacterial Antiseptic Antispasmodic Aphrodisiac Appetizer Digestive Diuretic Emmenagogue Expectorant Ophthalmic Stomachic TonicHou Po has been used in Chinese herbal medicine for at least 2.000 years. The aromatic, pungent and warming bark is used in the treatment of various disorders of the digestive system[254]. Ophthalmic[46, 61, 109, 174]. The flowers are an aromatic digestive tonic[238]. A decoction of the flower buds is an esteemed emmenagoque in China, their use is therefore contraindicated for pregnant women[218]. The flowers are used

plants are at least two years old. Plant them out into their permanent positions in early summer and give them some protection from winter cold for at least their next winter. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Landscape Uses:Arbor, Container, Woodland garden. Succeeds in most soils[182]. Requires a warm sheltered position in full sun or light shade in a well-drained moisture retentive moderately fertile soil[200]. Rich soils discourage flowering by encouraging excessive growth[200]. This species is not very hardy in Britain, succeeding outdoors only in the mildest areas of the country and even then usually requiring the protection of a wall[166, 182]. Plants can tolerate temperatures down to about -10°c if the wood has been thoroughly ripened[200]. A very ornamental plant, the flowers are sweetly fragrant[222] emitting a honey-like aroma[245]. This species is the state flower of South Carolina[238]. A climbing plant, supporting itself by twining around other plants and often ascending to the tops of lofty trees in its native habitat[4]. Special Features: Attracts birds, North American native, All or parts of this plant are poisonous, Wetlands plant, Extended bloom season in Zones 9A and above, Fragrant flowers, Attractive flowers or blooms.

# 8.2.447 Mirabilis nyctaginea

Wild Four O'clock Plant, Heartleaf four o'clock 7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 1 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Mirabilis nyctaginea is a PERENNIAL growing to Im (3ft 3in). See above for USDA hardiness. It is hardy to UK zone 8 and is frost tender. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista One report says that the plant is considered poisonous, but gives no details[222].

dwatta VulneraryThe chewed root is used as a poultice for wounds, burns, sores, sprains etc[207, 222, 257]. A tea made from the roots is also used to treat burns, fevers and to expel worms[213, 222, 257]. A tea made from the leaves or the roots is used in the treatment of bladder ailments[222]. Caution is advised in the use of this plant internally, see notes above on toxicity.

nrakta N. America - Wisconsin to Mexico. ksacta Prairies and rich soil[222]. Often found in calcareous clay soils[274].

propta Seed - sow spring in a greenhouse. When they are large enough to handle, prick the seedlings out into individual pots and plant them out in early summer, after the last expected frosts. The seed remains viable for several years[196]. Division in spring as the plant comes into growth[200].

nwatta Requires a fertile well-drained soil in full sun or part-day shade[200]. Plants flower in their first year from seed and, although they are not very hardy in Britain, they can either be grown as half-hardy annuals or the tubers can be harvested in the autumn and stored overwinter in a cool frost-free place in much the same manner as dahlias[200]. Members of this genus are rarely if ever troubled by browsing deer[233]

# 8.2.448 Eucalyptus urnigera

Urn tree

7tlin 9 cyuc 0 kcak 3 t<br/>can 3 dwat 15 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa<br/>7tli flatpriklwis hpa7tmwatli hjonli

drutta Eucalyptus urnigera is an evergreen Tree growing to 15 m (49ft) by 12 m (39ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 7. The flowers are pollinated by Birds. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semishade (light woodland) or no shade. It prefers moist soil. It cannot tolerate atmospheric pollution.

pcista Citronellal, an essential oil found in most Eucalyptus species is reported to be mutagenic when used in isolation[269]. In large doses, oil of eucalyptus, like so many essential oils has caused fatalities from intestinal irritation[269]. Death is reported from ingestion of 4 · 24 ml of essential oils, but recoveries are also reported for the same amount[269]. Symptoms include gastroenteric burning and irritation, nausea, vomiting, diarrhoea, oxygen deficiency, weakness, dizziness, stupor, difficult respiration, delirium, paralysis, convulsions, and death, usually due to respiratory failure[269].

tcanta An essential oil is obtained from the leaves. Total quantity of the oil, and its composition, can vary widely from plant to plant, but we have reports that the fresh leaves contain around 1.8 - 3.9% (2.5 - 5.6% dry weight) essential oil. The main components include phellandrene, cymene, pperitone, methyl cinnamate and eudesmol[1659]. The heartwood is pale brown, straw-coloured or pinkish; the 30mm thick band of sapwood is almost white. The wood is opentextured, straight-grained, with conspicuous growth rings. It bends fairly well, is easily worked and polishes well. An excellent timber, it is widely in construction, for purposes such as building framing, flooring, plywood and veneers, furniture, panelling, turnery, handles and pulp for hardboard and paper[1097, 1658]. A handsome dense foliaged screening tree and good garden specimen that is a superior ornamental tree to E. gunnii due to the attractive foliage and bark. Eucalyptus urnigera does not have any commercial use as a timber tree in Tasmania.

dwatta Eucalyptus leaves are a traditional Aboriginal herbal remedy. The essential oil found in the leaves is a powerful antiseptic and is used all over the world for relieving coughs and colds, sore throats and other infections[254]. The essential oil is a common ingredient in many over-thecounter cold remedies[254]. The plant is an aromatic, astringent, tonic herb that sticks to the teeth and turns the saliva red[238]. The report says that the leaves, essential oil and oleo-resin are used[238], but does not specify which properties apply to the different parts of the plant[K]. The leaves and the oil will have very similar properties, the oil being much stronger in its effect since it is distilled from the leaves[K]. Detailed below is how the oleo-resin and oil are commonly used in other species[K]. The essential oil obtained from various species of eucalyptus is a very powerful antiseptic, especially when it is old, because ozone is formed in it on exposure to air. It has a decided disinfectant action, destroying the lower forms of life[4]. The oil can be used externally, applied to cuts, skin infections etc, it can also be inhaled for treating blocked nasal passages, it can be gargled for sore throat and can also be taken internally for a wide range of complaints[4]. Some caution is advised, however, because like all essential oils, it can have a deleterious effect on the body in larger doses[4]. An oleo- resin is exuded from the tree[238]. It can also be obtained from the tree by making incisions in the trunk[4, 152]. This resin contains tannin and is powerfully astringent it is used internally in the treatment of diarrhoea and bladder inflammation[4, 152, 238], externally it is applied to cuts etc[4, 152]. Treats throat ailments[156].

nrakta An endemic Tasmanian alpine eucalypt of the subgenus Symphomyrtus. ksacta The dominant eucalypt species at altitudes from 600 to 1,000 metres (1,969 to 3,281 ft) on moist but well drained dolerite slopes and talus. Typically, it is found below the range of E. coccifera (snow gum) and above the mixed and wet sclerophyll forests of the lower slopes although it will grow within both vegetation types.

propta Seed - surface sow late winter/early spring in a sunny position in a greenhouse[11, 78, 134]. Species that come from high altitudes appreciate 6 - 8 weeks cold stratification at 2c[200]. Pot up the seedlings into individual pots as soon as the second set of seed leaves has developed, if left longer than this they might not move well. Plant out into their permanent positions in early summer and give them some protection from the cold in their first winter. The seed can also be sown in early summer, the young trees being planted in their final positions in late spring of the following year. The seed has a long viability[200].

nwatta A small to medium-sized fast growing tree endemic to Tasmania where it only occurs at mid to high altitudes. Prefers sun to light shade and well-drained soil, light moisture. Most reports say it is hardy to USDA Zone 8 although we have found references that it grows in zone 9. Flowering period: Late summer This species has been conshade. It prefers moist or wet soil and can tolerate drought. It can tolerate atmospheric pollution.

pcista Although no specific mention has been seen for this species, the following notes are for the closely related Hedera helix and quite possibly are relavent here[K]. The plant is said to be poisonous in large doses[7, 10, 65, 76] although the leaves are eaten with impunity by various mammals without any noticeable harmful affects. The leaves and fruits contain the saponic glycoside hederagenin which, if ingested, can cause breathing difficulties and coma[274]. The sap can cause dermatitis with blistering and inflammation. This is apparently due to the presence of polyacetylene compounds[274].

dwatta Cathartic Diaphoretic Skin StimulantThe leaves and the berries are said to be cathartic, diaphoretic and stimulant[243]. A decoction of the plant is used to treat skin diseases[272].

nrakta E. Asia - Himalayas. ksacta Moist stones and tree stems at elevations of 1600 - 3000 metres in Nepal[272].

propta Seed - remove the flesh, which inhibits germination, and sow the seed in spring in a cold frame[113]. Four weeks cold stratification will improve germination[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the cold frame for their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Cuttings of half-ripe wood, July/August in a shady position in a frame. Good percentage[78]. Cuttings of mature wood, 12cm long, November in a cold frame[78]. Layering. Plants often do this naturally.

nwatta Ivv is a very easily grown plant that dislikes waterlogged, very dry or very acid soils but otherwise succeeds in all soil types[1, 17, 238]. It grows well in heavy clay soils. Prefers some lime in the soil. Tolerates very dense shade[24. 31], though it may not flower in such a position[K]. This species is not hardy in all parts of Britain, tolerating temperatures down to about -5 to -10°c[200]. Ivy is a rampant climbing plant, clinging by means of aerial roots and often trailing on the ground in woods and hedges[186]. It is of benefit rather than harm when growing on a wall because it keeps the wall dry and acts as an insulation[11, 24]. It does not damage the structure of a wall. Similarly, it does not harm large trees when climbing into them, though it can shade out smaller and ailing trees[200]. It is not a parasitic plant, but instead obtains all its nutrient from the sun and the soil[186]. This species is notably resistant to honey fungus[200].

# 8.2.429 Abies religiosa

Sacred Fir

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 40 m hkuc pcimhmimhtut cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatprik hpa7tmwatli hjonli

drutta Abies religiosa is an evergreen Tree growing to 40 m (131ft 3in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, and the seeds ripen from October to November. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and can grow in heavy clay soil. Suitable pH: mildly acid and neutral soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Paint WoodAn oleo-resin is obtained from the tree (probably from the trunk)[46, 61]. It is balsamic and is used in medicines and in paints[46, 181]. Wood - light, soft, not very durable. Used for pulp, construction, furniture etc[46, 181]

dwatta BalsamicBalsamic.

nrakta South-western N. America - Mexico ksacta Mountains of N.W. Mexico at elevations of 2400 - 3000 metres[11].

propta Seed - sow early February in a greenhouse or outdoors in March[78]. Germination is often poor, usually taking about 6 - 8 weeks[78]. Stratification is said to produce a more even germination so it is probably best to sow the seed in a cold frame as soon as it is ripe in the autumn[80, 113]. The seed remains viable for up to 5 years if it is well stored[113]. When large enough to handle, prick the seedlings out into individual pots and grow them on for at least their first winter

in pots. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. Alternatively, if you have sufficient seed, it is possible to sow in an outdoor seedbed. One report says that it is best to grow the seedlings on in the shade at a density of about 550 plants per square metre[78] whilst another report says that they are best grown on in a sunny position[80].

nwatta Prefers a good moist but not water-logged soil[1]. Grows well in heavy clay soils. Plants are very shade tolerant, especially when young, but growth is slower in dense shade[81]. Intolerant of atmospheric pollution[1]. Prefers slightly acid conditions down to a pH of about 5[200]. Prefers growing on a north-facing slope[200]. Requires a sheltered position, trees are susceptible to wind damage[11]. Trees are tender in most parts of Britain[1, 11], they tolerate temperatures down to about -5 to -10°c[200]. There are trees in Kent and Hampshire that are 12 metres tall[11]. Grows best in the Perthshire valleys of Scotland and other areas with cool wet summers[11]. Growth from young trees has proved to be very vigorous in Britain, 60cm in its first year has been recorded and 70 cm in its third year from seed[185]. New growth takes place mainly between July and October 1851. Trees should be planted into their permanent positions when they are quite small, between 30 and 90cm in height. Larger trees will check badly and hardly put on any growth for several years. This also badly affects root development and wind resistance[200]. Plants are strongly outbreeding, self-fertilized seed usually grows poorly[200] They hybridize freely with other members of this genus[200]

## 8.2.430 Acourtia microcephala

Sacapellote

7 tlin 10 cvuc 0 kcak 0 tcan 1 dwat m hkuc

htut cyutli kyuctcup hwicli hyishrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Acourtia microcephala is a PERENNIAL growing to 1.4 m (4ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

dwatta A decoction of the plant has been used to bring about a very quick passage of the bowels[257].

nrakta South-western N. America - California. ksacta Dry sunny slopes[257].

propta Seed - sow spring in a greenhouse in a gritty welldrained compost, and only just cover the seed. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter, being careful not to over-water. Plant out in late spring or early summer. Division in the spring.

nwatta Requires a freely draining gritty soil, preferably of fairly low fertility, and a position in full sun[200]. Dislikes winter wet. Plants are not very hardy outdoors in Britain, though they should succeed in the milder areas of the country, especially if given the additional protection of a wall. They are hardy to about -10°c, so long as they are not too wet[257]. Excess moisture, especially in the winter, is the main cause of death.

## 8.2.431 Daphne odora

Winter Daphne, Fragrant Daphne 7 tlin 9 cyuc 0 kcak 0 tcan 2 dwat 1.5 m hkuc

hmimhtut cyutli tcup hwicli jlutnyik hpa7tli flatprik hpa7tmwatli xre7t hjonli

drutta Daphne odora is an evergreen Shrub growing to 1.5 m (5ft) by 1.5 m (5ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to March. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid and neutral soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista All parts of the plant are poisonous[200]. Skin contact with the sap can cause dermatitis in some people[65, 200].

tcanta Pot-pourriThe flowers are very fragrant, they are put in sachets and used for pot-pourri. They are also used to perfume water[46, 61]. The cultivar 'Aureo-marginata' can be used as a ground cover when planted about 1 metre apart each way[208].

dwatta Anodyne Antiphlogistic Antispasmodic Depurative OphthalmicThe flowers and the stems are anodyne, antiphlogistic, antispasmodic, depurative and ophthalmic[147]. A decoction is used in the treatment of backache, myalgia, skin diseases, poor vision etc[147, 218]. A decoction of the leaves is used in the treatment of laryngitis and sore throats[218]. A decoction of the roots and leaves is used in the treatment of sore throat and caked breast[218].

nrakta E. Asia - W. China, Japan. ksacta In the shade of upland trees around 1000 metres[147].

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°c followed by 12 - 14 weeks at 3°c. Germination may still take another 12 months or more at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood, 7 - 10cm long at a node or with a heel, July/August in a frame. Lavering

nwatta Landscape Uses:Border, Container, Foundation, Ground cover, Massing, Rock garden, Specimen. Prefers a cool, lime-free well-drained friable soil[1] and some shelter from cold winds[166]. Succeeds in full sun or semishade[219]. This species is not generally hardy in Britain[1] but succeeds outdoors in Devon and Cornwall[11], tolerating temperatures down to about -5°c[200]. The cultivar 'Aureomarginata' is hardy to about -13°c when grown in a very well-drained soil and it succeeds outdoors at Wislev[200]. Plants can be difficult to establish[208]. A very ornamental plant, a number of named forms have been developed for their ornamental value[182]. The flowers are powerfully fragrant with a spicy undertone[245]. Plants seldom set fruit in British gardens[219]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188]. This species is often affected by virus diseases. Some virus-free clones have been produced. their name is normally followed by the letters FKV (free of all known virus)[184]. Special Features: Not North American native, All or parts of this plant are poisonous, Fragrant flowers, Attractive flowers or blooms.

## 8.2.432 Ballota nigra

Black Horehound

7tlin 10 cyuc 0 kcak 0 tcan 3 dwat 0.9 m hkuc pcimhmimhtut cyutli tcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ballota nigra is a PERENNIAL growing to 0.9 m (3ft) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8 and is not frost tender. It is in flower from June to October. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Antianxiety Antiemetic Antispasmodic Stimulant VermifugeBlack horehound has a long history of herbal use, though is not widely employed in modern herbalism because of its unpleasant flavour[238, 268]. Nonetheless, it does have a range of medicinal virtues, being especially effective in its action as an antiemetic[254]. In the past it was often used for treating problems connected with the respiratory system, convulsions, low spirits and the menopause, but present day authorities differ over whether it was effective in these

applications[254]. The whole plant is antiemetic, antispasmodic, expectorant, stimulant and vermifuge[4, 165, 238]. It is taken internally in the treatment of nervous dyspepsia, travelling sickness, morning sickness in pregnancy, arthritis, gout, menstrual disorders and bronchial complaints[238, 254]. The plant is harvested as it comes into flower and is dried for later use[238]. It should not be stored for longer than a year[238]. The fresh herb is sometimes used to make a syrup[238].

nrakta Most of Europe, including Britain, south and east from Scandanavia to N. Africa and E. Mediterranean ksacta Waste ground, hedgerows, woods and shady places, preferring nitrogen-rich, moist, rather loose soil [13, 268].

propta Seed - sow spring or autumn in a greenhouse. The seed usually germinates in 3 - 6 weeks at 15°c[134]. Prick out the seedlings into individual pots when they are large enough to handle and plant them out into their permanent positions in the summer or following autumn. Division in spring. Larger divisions can be planted straight into their permanent positions whilst smaller clumps are best potted up and kept in a cold frame until they are growing away well.

nwatta Prefers a well-drained soil in full sun or partial shade[134, 238]. Avoids acid soils in the wild but tolerates a pH down to 5 in cultivation[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. This species is widely grown in herb gardens, but little employed because of its strong flavour[238]. Its essential oil is used to adulterate the oil of white horehound (Marrubium vulgare)[238]. The leaves emit a most unpleasant smell when bruised, somewhat like stale perspiration[245]. Plants can self-sow freely when well-sited[238]. There is at least one named variety selected for its ornamental value[238]. The whole plant has an offensive odour[4].

## 8.2.433 Cupressus sempervirens

Italian Cypress

7 tlin 11 cyuc 0 kcak 0 tcan 2 dwat 30 m hkuc

htut cyutli hgatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Cupressus sempervirens is an evergreen Tree growing to 30 m (98ft) by 5 m (16ft) at a medium rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from January to February. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought.

pcista Poisonous[76]. No more details.

tcanta Cosmetic Essential WoodAn essential oil is distilled from the shoots. It is used in perfumery and soap making[1, 46, 61]. The leaves contain about 2% essential oil whilst the wood contains about 2.5%[240]. An infusion of the wood is used in footbaths to combat perspiration of the feet[7]. Wood - fragrant, very hard and durable. A popular wood for building uses, cabinet making and wardrobes, especially since it retains its fragrance, repels moths and is impervious to woodworm[1, 7, 11, 89].

dwatta Anthelmintic Antipyretic Antirheumatic Antiseptic Aromatherapy Astringent Balsamic Vasoconstrictor VulneraryThe cones and young branches are anthelmintic, antipyretic, antirheumatic, antiseptic, astringent, balsamic and vasoconstrictive[7, 46, 240]. They are harvested in late winter and early spring, then dried for later use[7]. Taken internally, it is used in the treatment of whooping cough, the spitting up of blood, spasmodic coughs, colds, flu and sore throats[254]. Applied externally as a lotion or as a diluted essential oil (using an oil such as almond), it astringes varicose veins and haemorrhoids, tightening up the blood vessels[254]. A foot bath of the cones is used to cleanse the feet and counter excessive sweating[254]. The extracted essential oil should not be taken internally without professional quidance[254]. A resin is obtained from the tree by making incisions in the trunk[7]. This has a vulnerary action on slowhealing wounds and also encourages whitlows to come to a head[7]. An essential oil from the leaves and cones is used in aromatherapy. Its keyword is 'Astringent' [210].

used as a strewing herb in churches etc[4]. The flowering stems, once the flowers have been removed for use in potpourri etc, can be tied in small bundles and burnt as incense sticks[245].

dwatta Antiasthmatic Antiseptic Antispasmodic Digestive ExpectorantFrench lavender has similar medicinal properties to common lavender (L. angustifolia). It yields more essential oil than that species but is of inferior quality[254]. The flowers, and the essential oil derived from them, are antiasthmatic, antiseptic, antispasmodic, digestive and expectorant[4, 44, 61, 238]. It is used internally to alleviate nausea[238]. Externally, the essential oil is used as an antiseptic wash for wounds, ulcers, sores etc and as a relaxing oil for massage[238, 254].

nrakta S.W. Europe. ksacta Dry hills, garigue and open woods on limestone and granite soils[89].

propta Seed - sow spring in a greenhouse and only just 15°c. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse or cold frame for their first winter, planting them out in late spring after the last expected frosts. Cuttings of half-ripe wood 7 - 10cm with a heel, July/August in a frame. Usually very east, a high percentage will root within a few weeks[78]. Grow them on in the greenhouse for their first winter and plant them out in late spring after the last expected frosts. Cuttings 7cm with a heel succeed at almost any time of the year[1]. Layering.

nwatta Succeeds in almost any soil so long as it is welldrained and not too acid[1, 200]. Prefers a sunny position in a neutral to alkaline soil[1, 200], growing well on chalk[11]. When grown in rich soils the plants tend to produce more leaves but less essential oils[4]. Grows well in a hot dry position[166]. Established plants are drought tolerant[190]. When growing for maximum essential oil content, the plant must be given a very warm sunny position and will do best in a light sandy soil, the fragrance being especially pronounced in a chalky soil[245]. Hardy to between -5 and -10°c[184], it is often killed in severe winters in Britain[11]. Plants are not very long-lived and soon become straggly unless pruned. Any trimming of the plant is best done in spring and should not be done in the autumn since this can encourage new growth that will not be very cold-hardy[200]. Polymorphic[200]. A good bee plant, also attracting butterflies and moths[30]. The flowering spike has showy infertile flowers to attract insects at the top of the stem and small fertile flowers beneath[190]. A good companion for most plants[54], growing well with cabbages[14].

## 8.2.445 Edgeworthia chrysantha

Oriental paperbush

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Edgeworthia chrysantha is a deciduous Shrub growing to 2 m (6ft) by 2 m (6ft). See above for USDA hardness. It is hardy to UK zone 8 and is frost tender. It is in flower from February to April, and the seeds ripen from May to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

tcanta Paper StringA high-class paper is made from the bark[1, 11, 58, 61]. The bark fibres are used[61]. The stems are harvested in spring or early summer, the leaves are removed and the stems steamed until the fibres can be stripped. The outer bark is removed from the inner by peeling or scraping. The fibres are cooked for 2 hours with soda ash and then beaten with mallets or put through a blender. The paper is off white in colour[189]. The stems are extremely supple and can be tied in knots[11, 182].

dwatta OphthalmicThe sliced root is used as a remedy for eye diseases[218].

nrakta E. Asia - China. ksacta Forests and streamsides, at elevations of 300 - 1600 metres in Ichang Province[109, 200].

propta Seed - best sown as soon as it is ripe in a cold frame. Place the pot in a plastic bag to keep it moist[175].

The seed might germinate in the spring, though it could take another 12 months. Stored seed usually requires 8 - 12 weeks warm stratification at 20°c followed by 12 - 14 weeks at 3°c[175]. Germination can still take 12 months or more at 15°c[175]. Prick out the seedlings into individual pots as soon as they are large enough to handle, and grow on in a greenhouse for at least a year before planting out in late spring or early summer[175]. Consider giving the plants some protection from the cold for their first winter outdoors. Cuttings in spring. Cuttings of half-ripe wood, July/August in a frame[200].

nwatta Succeeds in any soil in sun or part shade[175, 184, 200], growing well in light woodland[200]. Prefers a well-drained soil with plenty of moisture in the growing season[1, 200]. This species is hardy to about -15°c according to one report[184], though others say that it is only hardy in the milder areas of Britain[1, 11]. It succeeds on a wall at Kew[K] and as a free-standing shrub in Cornwall[11]. The plant is frost hardy, but the flowers are susceptible to frost damage[188]. The plant is best grown on a south or west-facing wall[188]. Plants resent root disturbance and should be put into their permanent positions as soon as possible[188]. This species is cultivated in Japan for the paper that can be made from the bark[1, 11, 109]. The stems are harvested every second year[61]. This species is very closely related to and scarcely distinct from E. gardneri and E. papyrifera[200]. The flowers diffuse a pronounced clove-like perfume and will scent the air to some distance on a calm day[245].

## 8.2.446 Gelsemium sempervirens

False Jasmine, Yellow Jessamine, Evening Trumpetflower, Carolina Iasmine

7 tlin 9 cyuc 0 kcak 0 tcan 4 dwat 3 m hkuc

hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hionli

drutta Gelsemium sempervirens is an evergreen Climber growing to 3 m (9ft 10in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 9. It is in leaf all year, in flower from May to July. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista All parts of the plant usually contain toxic alkaloids[200]. Eating just one flower has reportedly been lethal to children[207, 222]. The plant can also cause skin allergies in some people and it is possible that the plant toxins can be absorbed through the skin, especially if there are cuts[238].

dwatta Analgesic Antispasmodic Diaphoretic Febrifuge Homeopathy Hypnotic Mydriatic Nervine Sedative VasodilatorThe roots are analgesic, antispasmodic, diaphoretic, febrifuge, hypnotic, mydriatic, nervine, sedative and vasodilator[46, 165, 192, 222, 238]. A powerful depressant of the central nervous system, deadening pain and reducing spasms[222]. It is said to suspend and hold in check muscular irritability and nervous excitement with more force and power than any known remedy. Whilst it relaxes the muscles, it also relieves all sense of pain[4]. It is used internally in the treatment of neuralgia, migraine, sciatica, toothache, severe pain (especially in terminal illnesses or accidents) and meningitis[238]. Externally it has been used as a folk remedy for cancer[222]. The root is best harvested in the autumn and dried carefully for later use[4]. Extreme care is advised with the use of this plant, it should only be used under the supervision of a qualified practitioner[238]. Excessive doses cause respiratory depression, giddiness, double vision and death[238]. It should not be prescribed for patients with heart disease, hypotension or myasthenia gravis[238]. See also the notes above on toxicity. The fresh root is used to make a homeopathic remedy[232]. It is used in the treatment of a variety of complaints, including fevers, flu and

nrakta South-eastern N. America - Florida to Texas and north to Arkansas and S. Virginia. ksacta Along sea coasts[166] in dry to wet woods, thickets and sands[43].

propta Seed - sow spring in a warm greenhouse[200]. Prick out the seedlings into individual pots when they are large enough to handle and grow on in the greenhouse until

sharp pains in the breast, and as a wash for headaches[257]. This plant should be used with caution, it is irritating in large doses and can cause nausea, griping pains in the bowels etc[4, 21, 222]. It should only be used internally under the supervision of a qualified practitioner[238]. The bruised root is placed in hollow teeth for treating toothache[207]. An extract of the root can be drunk to relieve stomach pains[207]. The boiled root, or a decoction of the whole plant, can be used to treat fevers[213]. The chewed root or crushed leaves was applied to snakebites[207, 213]. This species was the most popular snakebite remedy in N. America[213]. It has also been applied externally to slow-healing wounds and in the treatment of pleurisy[238].

nrakta South-eastern N. America - Connecticut to Florida, west to Texas and Ohio. ksacta Rich dry woods, usually on calcareous soils[21, 43].

propta Seed - best sown in a greenhouse as soon as it is ripe in the autumn. Pre-soak stored seed for 48 hours in hand-hot water and surface sow in a greenhouse[134]. Germination usually takes place within 1 - 3 months at 20°c[134]. Stored seed germinates better if it is given 3 months cold stratification at 5°c[200]. When large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for their first winter. Plant out in late spring or early summer after the last expected frosts. Division in autumn[200]. Root cuttings in winter[200].

nwatta Prefers a well-drained loamy soil, rich in organic matter, in sun or semi-shade[1, 200], but succeeds in ordinary garden soil[134]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Most species in this genus have malodorous flowers that are pollinated by flies[200]. The flowers of this plant are sometimes cleistogomous[235].

## 8.2.442 Ardisia crenata

Coralberry, Hen's eyes, Spiceberry 7 tlin 10 cyuc 0 kcak 1 tcan 1 dwat 2 m hkuc hmim cyutli tcup hwicli hrasjlutnyikfrip hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Ardisia crenata is an evergreen Shrub growing to 2 m (6ft) by 2 m (6ft) at a slow rate. See above for USDA hardiness. It is hardy to UK zone 7. It is in leaf all year, in flower from June to July, and the seeds ripen from September to December. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in heavy clay soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland). It prefers moist soil.

tcanta Landscape Uses: Container. Used as an ornamental plant in shady conditions.

dwatta Anodyne Depurative FebrifugeThe root is anodyne, depurative, febrifuge[147, 218]. It is used to stimulate blood circulation[147].

nrakta E. Asia - China, Japan, Korea, India. ksacta Woods in low mountains, C. and S. Japan[58]. Forests, hill-sides, valleys, shrubby areas, dark damp places at elevations of 100 - 2400 metres[266].

propta Seed - best harvested when it is ripe in the winter and sown immediately in a greenhouse[1]. Sow stored seed as early in the year as possible. When large enough to handle, prick the seedlings out into individual pots and grow them on in a shady part of the greenhouse for at least their first winter. Plant out into their permanent positions in late spring or early summer, once the plants are 20cm or more tall. Cuttings of half-ripe wood in summer[200]. Grow on in cool, shaded humid conditions until well rooted[200].

nwatta Prefers a well-drained humus rich soil in partial shade in a position sheltered from cold drying winds[200]. We are not sure if this plant is hardy outdoors in Britain. One report says that it is hardy in zone 7 (tolerating temperatures down to between -10 and -15°c) but then goes on to suggest that it needs an essentially frost-free climate and is often grown as an indoor pot plant in Britain[200]. This species is closely related to A. pseudocrispa, from which it differs in having crenate leaves with a distinct marginal vein[266]. There has been some confusion between this species and A. crispa, the name Ardisia crispa was misapplied by de Candolle to Ardisia crenata[266]. Special Features: Attractive foliage, Not North American native, Invasive, Fragrant flowers.

## 8.2.443 Crinum asiaticum

Asian Poison Bulb

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 1.2 m hkuc htut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Crinum asiaticum is a BULB growing to 1.2 m (4ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers moist soil.

pcista The bulb is said to be poisonous[270].

dwatta Emetic PoulticeThe bulb contains alkaloids, notably lycorine and crinamine[283]. A poultice made from the heated, pounded, fresh bulb is used to relieve osteodynia and rheumatism[283]. The juice of the fresh bulb is used as an emetic, whilst it is also instilled in the ear to treat otis[283]. A poultice of the heated, pounded, fresh leaves is used to treat contusions, sprains, fractures, luxations etc[283]. A decoction of the dried leaves is used as a wash in the treatment of haemorrhoids[283].

nrakta E. Asia - China, Burma, Vietnam. ksacta Introduced and locally naturalised in wet places in Florida and Louisiana[270].

propta Seed - best sown as soon as it is ripe, placing 2 - 3 seeds in individual pots in a greenhouse. Do not cover the seed. Sow stored seed April/May in a warm greenhouse. Once they have germinated, you can thin each pot to just one plant if required, though we have not found this to be necessary. Give an occasional liquid feed to ensure that the plants do not suffer nutritional deficiencies. Grow them on in the greenhouse for at least their first 2 years, planting them out into their permanent positions in the spring. Division of offsets in April/May or in September. When divided in the spring, the bulbs can be planted out direct into their permanent positions, if done in September, however, they should be potted up and overwintered in the greenhouse.

nwatta Prefers a deep, well-drained but moisture-retentive fertile soil that is rich in organic matter[200]. The bulbs must have sufficient moisture during the growing season[200]. Plants are not very cold hardy, tolerating occasional lows down to about -5°c[200]. In regions at the limits of their cold hardiness, they are best given the protection of a south or southwest facing wall. Plant the bulbs shallowly, with the neck of the bulb at soil level, and give a protective mulch of bracken or compost in the winter[200]. A robust and very variable species[270]. Bulbs are sensitive to transplanting and can take several years to become established. After this, they will usually reproduce rapidly from offsets to produce the overcrowded conditions that stimulate them to flower freely[200].

#### 8.2.444 Lavandula stoechas

French Lavender

7 tlin 10 cyuc 0 kcak 4 tcan 2 dwat 0.8 m hkuc

htut cyutli hgatkyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Lavandula stoechas is an evergreen Shrub growing to 0.8 m (2ft 7in) by 0.8 m (2ft 7in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to August, and the seeds ripen from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, Lepidoptera (Moths and Butterflies). It is noted for attracting wildlife. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerates strong winds but not maritime exposure.

tcanta Essential Incense Pot-pourri RepellentAn essential oil is obtained from the flowers - used in soap making, perfumery, medicinally etc[46, 61]. When growing the plant for its essential oil content, it is best to harvest the flowering stems as soon as the flowers have faded[245]. The aromatic leaves and flowers are used in pot-pourri, as an insect repellent in the linen cupboard etc[89, 148, 238]. They are also

nrakta S. Europe to W. Asia. ksacta Rocky mountainous areas, usually near the coast, in S. Europe[45, 89].

propta Seed - sow late winter in a cold frame and only just cover the seed[164]. Three weeks cold stratification can improve germination rates[164]. The seed usually germinates in 1 - 2 months at 20°c. The seedlings are very subject to damping off so should be watered with care and kept well-ventilated[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can store for several years[113]. Cuttings of almost ripe wood, September in a frost-proof frame[1]. April/May is the best time to take cuttings[113].

nwatta Landscape Uses:Border, Screen, Specimen. Thrives in a deep well-drained loamy or peaty soil[11]. Established plants are very tolerant of hot dry conditions and drought[81]. Tolerates poor sandy soils[81] but is then more subject to damage by white-scale insects in a succession of dry seasons[11]. Plants are not very happy when growing on chalky soils but they thrive on limestone[200]. Requires a sunny position[81]. This species is somewhat tender in Britain especially when young and at least in the north of the country[81], it grows best in the south and the west[11]. Trees are probably much hardier than has been supposed. No trees were reported as killed by the very severe winter of 1962 - 3, even some trees east of Edinburgh survived without damage. A healthy tree at Cambridge botanical gardens was 6 metres tall in 1989[K]. Growth can be guite vigorous, especially in young trees, with many averaging 60cm a year[185]. Growth slows and almost comes to a halt when the tree is 12 - 15 metres tall[185]. New growth takes place from mid-May to mid-October[185]. Plants are subject to injury by the wind[1, 11]. Trees are notably susceptible to honey fungus[200]. The seed takes two summers to mature[227]. Mature cones can remain unopened on the tree for a number of years[81]. They open after the heat of a forest fire to scatter their seeds which then germinate and grow away quickly in the ashes of the fire[200]. Plants are resentful of root disturbance, any transplanting should be done in April or September when the roots are in active growth[11, 81]. A very variable plant[11]. Special Features: Not North American native, Inconspicuous flowers or blooms.

## 8.2.434 Agalinis tenuifolia

Slenderleaf False Foxglove

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkuc

hmimhtut cyutli hgatkyuctcup hwicli hrasjlut hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Agalinis tenuifolia is a PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to August. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy) and medium (loamy) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil and can tolerate drought.

pcista  $\overline{\text{The}}$  plant is said to be poisonous to cattle and sheep[274].

dwatta An infusion of the plant has been used in the treatment of diarrhoea[257].

nrakta N. America. ksacta Moist open areas and low woods in Texas[274].

propta Seed -

nwatta Requires a well-drained soil, preferably on the dry side[257]. Grows well in a woodland garden[257]. This species is not very hardy outdoors in Britain, tolerating temperatures down to between -5 and -10°c[257]. A semi-parasitic plant, thus making it very difficult to establish in cultivation[200]. We are not sure which species it parasitizes[257].

# 8.2.435 Daphne bholua

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 2 m hkuc pcimhmimhtut cyutli kyuctcup hwicli jlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli drutta Daphne bholua is an evergreen Shrub growing to 2 m (6ft) by 1.5 m (5ft). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from January to April. The species is hermaphrodite (has both male and female organs) and is pollinated by Bees, flies, Lepidoptera (Moths and Butterflies). Suitable for: medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in full shade (deep woodland) semi-shade (light woodland) or no shade. It prefers dry or moist soil. It can tolerate atmospheric pollution.

pcista All parts of the plant are poisonous[76]. Skin contact with the sap can cause dermatitis in some people[200].

tcanta Fibre PaperA very good quality paper is made from the inner bark[11, 46, 51, 61, 272]. It is one of the principle sources of hand made paper in Nepal[272]. The fibre in the inner bark can be used to make rope[146, 272].

dwatta Anthelmintic FebrifugeThe juice of the roots, combined with molasses, is used in the treatment of fevers and intestinal problems[272]. A decoction of the bark is used to treat fevers[272]. The powdered seeds are anthelmintic[272].

nrakta E. Asia - Himalayas - Uttar Pradesh to S.W. China. ksacta Clearings in oak and rhododendron forests and shrubberies to 3100 metres[51]. Moist shady places under trees at elevations of 1000 - 3200 metres in Nepal[272].

propta Seed - best sown in a greenhouse as soon as it is ripe with the pot sealed in a polythene bag to hold in the moisture. Remove this bag as soon as germination takes place[164]. The seed usually germinates better if it is harvested 'green' (when it has fully developed but before it dries on the plant) and sown immediately. Germination should normally take place by spring, though it sometimes takes a further year. Stored seed is more problematic. It should be warm stratified for 8 - 12 weeks at 20°c followed by 12 - 14 weeks at 3°c. Germination may still take another 12 months or more at 15°c[164]. Prick out the seedlings into individual pots as soon as they are large enough to handle. Grow the plants on in the greenhouse for their first winter and then plant out in spring after the last expected frosts. Cuttings of half-ripe wood with a heel, June/July in a frame[214]. Division of suckers[214]. Layering.

nwatta Prefers a cool lime-free well-drained sandy loam and a sunny position[1, 11]. Succeeds in neutral soils[11] and tolerates partial shade[200]. Plants also succeed in quite deep shade[219]. At least some forms, especially the sub-species D. bholua glacialis.(see below) tolerate alkaline soils[184]. Flowers well when grown in dry shade[184]. Likes plenty of moisture in the growing season[11]. Grows well in London, tolerating atmospheric pollution[184]. Said to be hardy to about -5°c[200], plants succeed outdoors in southern England, but are defoliated in severe winters[11]. Plants at higher altitudes in its native range are often deciduous whilst plants from lower altitudes are evergreen but less hardy[166]. A very variable and very ornamental species[1, 200], the cultivars 'Ghurka' (deciduous) and 'Jacqueline Postill' (evergreen) are more hardy than the type[182, 200]. One report says that the cultivar 'Ghurka' is part of the deciduous sub-species D. bholua glacialis. (W.W.Smith. and Cave.)Burtt. and that it can tolerate temperatures down to about -10°c[184]. The flowers are fragrant[272]. Because it flowers in the winter, this species seldom produces much seed in Britain unless it is hand-pollinated[214]. Plants often sucker and form clumps in the wild[214]. Plants are resentful of root disturbance and should be planted into their permanent positions as soon as possible[188].

#### 8.2.436 Gentiana crassicaulis

1459

7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat 0.4~m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli xre7t hjonli

drutta Gentiana crassicaulis is a PERENNIAL growing to 0.4 m (1ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower in August, and the seeds ripen in September. The species is hermaphrodite (has both male and female organs) and is pollinated by Bumblebees, butterflies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow

in semi-shade (light woodland) or no shade. It prefers moist soil.

dwatta Analgesic Antiinflammatory Antipyretic Antirheumatic Diuretic HypotensiveThe roots of gentian species contain some of the most bitter compounds known and make an excellent tonic for the whole digestive system, working especially on the stomach, liver and gall bladder[238]. The root is analgesic, anti-inflammatory, antipyretic, antirheumatic, diuretic, febrifuge, hypoglycaemic and hypotensive[176, 218, 238]. The root is used internally in the treatment of arthritis, allergic inflammations, low-grade fever in chronic diseases, jaundice and hepatitis[176, 218, 238]. The root is harvested in the autumn and dried for later use.

nrakta E. Asia - W. China. ksacta Damp patches in mountainous regions[239]. Wastelands, grasslands, roadside slopes, alpine meadows, scrub, forest margins and forests at elevations of 2100 - 4500 metres[266].

propta Seed - best sown as soon as it is ripe in a light position in a cold frame[200]. It can also be sown in late winter or early spring but the seed germinates best if given a period of cold stratification and quickly loses viability when stored, with older seed germinating slowly and erratically [200, 239]. It is advantageous to keep the seed at about 10°c for a few days after sowing, to enable the seed to imbibe moisture[239]. Following this with a period of at least 5 - 6 weeks with temperatures falling to between 0 and -5°c will usually produce reasonable germination[239]. It is best to use clay pots, since plastic ones do not drain so freely and the moister conditions encourage the growth of moss, which will prevent germination of the seed[239]. The seed should be surface-sown, or only covered with a very light dressing of compost. The seed requires dark for germination, so the pots should be covered with something like newspaper or be kept in the dark[239]. Pot up the seedlings into individual pots as soon as they are large enough to handle and grow on in light shade in the greenhouse for at least their first winter. The seedlings grow on very slowly, taking 2 - 7 years to reach flowering size[239]. When the plants are of sufficient size, place them out into their permanent positions in late spring or early summer. Division in March[111]. Most members of this genus have either a single tap-root, or a compact root system united in a single root head, and are thus unsuitable for division[239]. Cuttings of basal shoots in late spring[238].

nwatta In general, gentians require a moist well-drained soil in a sheltered position, a certain minimum of atmospheric humidity, high light intensity but a site where temperatures are not too high[239]. They are therefore more difficult to grow in areas with hot summers and in such a region they appreciate some protection from the strongest sunlight[200, 239]. Most species will grow well in the rock garden[200]. This species is easily grown in most soils and usually produces an abundance of fertile seed[239]. A moisture loving plant, preferring to grow with full exposure to the sun but with plenty of underground moisture in the summer, it grows better in the north and west of Britain[1]. This species is not very hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. Closely related to G. tibetica[266]. Plants are intolerant of root disturbance[200].

## 8.2.437 Hyoscyamus aureus

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat 0.6 m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hjonli

drutta Hyoscyamus aureus is a BIENNIAL/PERENNIAL growing to 0.6 m (2ft). See above for USDA hardiness. It is hardy to UK zone 8. The species is hermaphrodite (has both male and female organs). Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It cannot grow in the shade. It prefers dry or moist soil.

pcista All parts of the plant are very toxic[7, 10, 19, 65, 76, 200]. Symptoms of poisoning include impaired vision, convulsions, coma and death from heart or respiratory failure[238].

dwatta AnodyneThe whole plant is analgesic[148]. Caution is advised, see notes above on toxicity.

nrakta S. Europe to W. Asia. ksacta Cliffs, old walls and ruins to 1200 metres[187].

propta Seed - best sown as soon as it is ripe, older seed rapidly loses viability[200]. Either sow in situ or pot up the seedlings whilst still small because plants produce a long taproot and older plants resent root disturbance[200].

nwatta Prefers a hot dry position[200] in a wall or rock crevice[187]. Succeeds in a well-drained fertile soil, preferably of an alkaline nature, in full sun[200]. Grows well in maritime areas[200]. Plants are possibly hardy to about -10°c[187], they are unlikely to succeed in the colder areas of Britain. Self-sows freely, it can be grown in wild informal areas of the garden[200].

#### 8.2.438 Marah macrocarpus

Chilicothe, Cucamonga manroot

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat m hkuc htut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli fyifxre7t hjonli

drutta Marah macrocarpus is a PERENNIAL CLIMBER growing to 5 m (16ft 5in) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from July to September. The species is hermaphrodite (has both male and female organs) and is pollinated by Insects. The plant is self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

tcanta Dye Paint Parasiticide SoapA red dye is obtained from the seed[61]. It can be mixed with iron oxide and turpentine to make a paint[257]. The root is used to make a detergent lather[257].

dwatta Parasiticide Purgative SkinThe root is purgative[61, 257]. The seed is made into a paste and used as a treatment on pimples and skin sores[257]. The oil from the seed is rubbed into the scalp to treat diseased scalps and hair roots[257]. The plant juices can be used as a parasiticide, rubbed onto areas of skin affected by ringworm[257].

nrakta South-western N. America - California. ksacta Dry places below 900 metres[71].

propta Seed - sow early spring in pots of rich soil in a greenhouse. Germination usually takes place within 1 - 2 weeks at  $20^{\circ}$ c. Put 2 or 3 seeds in each pot and thin to the best plant. Grow on fast and plant out after the last expected frosts.

nwatta Prefers a sunny position in a well-drained rich soil with abundant moisture[1, 175]. Succeeds in ordinary garden soil[175]. Plants are found in dry soils in the wild so this suggests that they will be better off in a dry soil in this country[K]. A perennial plant, it is not very hardy in Britain, tolerating temperatures down to about -5°c, and is perhaps best grown as an annual. A climbing plant, supporting itself by means of tendrils[219].

### 8.2.439 Cupressus macrocarpa

Monterey Cypress

7 tlin 10 cyuc 0 kcak 0 tcan 1 dwat m hkuc

htut cyutli ngatkyuctcup hwicli hyishrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli hjonli

drutta Cupressus macrocarpa is an evergreen Tree growing to 25 m (82ft) by 25 m (82ft) at a fast rate. See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from April to June. The species is monoecious (individual flowers are either male or female, but both sexes can be found on the same plant) and is pollinated by Wind. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils, prefers well-drained soil and can grow in nutritionally poor soil. Suitable pft: mildly acid, neutral and basic (mildly alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil and can tolerate drought. The plant can tolerate maritime exposure.

tcanta Hedge Hedge Shelterbelt WoodA good fast growing hedge for the milder areas of Britain, tolerating maritime exposure[11, 29, 75]. It can be trimmed so long as it is not cut back into old wood. Wood - heavy, hard, strong, closegrained and very durable[82]. Used for general construction[50, 61].

dwatta AntirheumaticA decoction of the foliage has been used in the treatment of rheumatism[257].

nrakta South-western N. America - California. ksacta Cliffs by the shore in just 2 small locations in California[11, 821.

propta Seed - sow late winter in a cold frame and only just cover the seed[164]. Three weeks cold stratification can improve germination rates[164]. The seed usually germinates in 1 - 2 months at 20°c. The seedlings are very subject to damping off so should be watered with care and kept well-ventilated[113]. When they are large enough to handle, prick the seedlings out into individual pots and grow them on in the greenhouse for at least their first winter. Plant them out into their permanent positions in late spring or early summer, after the last expected frosts. The seed can store for several years[113]. Cuttings of almost ripe wood, September in a frost-proof frame[1]. April/May is the best time to take cuttings[113].

nwatta Thrives in a well-drained loamy or peaty soil[11]. Very tolerant of hot dry conditions[81]. Tolerates poor sandy soils[81] but is then more subject to insect damage in a succession of dry seasons[11]. Requires a sunny position[81]. Plants are not happy when growing on chalk, but they thrive on limestone[200]. Very tolerant of maritime exposure[11. 75, 82] but plants are not very wind firm in shallow soils[166]. Young trees require staking when planted in very exposed positions[75]. This species is somewhat tender in Britain, especially when young and at least in the north of the country Established trees, however, will tolerate occasional temperatures down to about -10°c and are hardy in most British winters[11, 81, 260]. A tree is 25 metres tall at Kew (1988) but in general they grow better in the western maritime zone[11]. The variety 'Lutea' is hardier than the type and is also more tolerant of wind and salt spray as well as of trimming[185]. New growth takes place from May to September and can be very vigorous when young with new shoots 1 metre long and increases in girth of 5cm or more a year even in old trees[185]. Trees in a very exposed maritime position at Rosewarne in N. Cornwall were 12 metres tall after 30 years[75]. Resents root disturbance, it is best planted out when the roots are in active growth in early autumn or spring[81]. Often planted for shelter and ornament, and also occasionally for timber in W. and S. Europe[50]. The cones ripen in their second year [82]. They can remain closed on the tree for a number of years, opening after the heat of a forest fire to scatter their seeds which then germinate and grow quickly in the ashes of the fire[200]. The crushed leaves have a strong scent of lemon verbena[185]. Trees are notably susceptible to honey fungus[200].

#### 8.2.440 Ilex purpurea

7 tlin 10 cyuc 0 kcak 0 tcan 2 dwat 12 m hkuc hmimhtut cyutli tcup hwicli hrasjlutnyik hpa7tli flatpriklwis hpa7tmwatli nyanhjen hjonli

drutta llex purpurea is an evergreen Tree growing to  $12 \, \mathrm{m}$  (39ft 4in). See above for USDA hardiness. It is hardy to UK zone 8. It is in leaf all year, in flower from May to June, and the seeds ripen from September to December. The species is dioecious (individual flowers are either male or female, but only one sex is to be found on any one plant so both male and female plants must be grown if seed is required). and is pollinated by Bees. The plant is not self-fertile. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It prefers moist soil.

pcista Although no specific reports of toxicity have been seen for this species, the fruits of at least some members of this genus contain saponins and are slightly toxic. They can cause vomiting, diarrhoea and stupor if eaten in quantity[274].

dwatta Cancer Carminative Skin TonicThis plant is commonly used in Chinese herbalism, where it is considered to be one of the 50 fundamental herbs[218]. It is reported to have antitumor properties[218]. An extract of the leaves is made into a solution and used for treating burns, ulcers in the lower extremities etc[218]. The ashes of the leaves are used as a dressing for skin ailments and poisoned wounds[218]. Seed is carminative and tonic[218].

nrakta E. Asia - China, Japan. ksacta Evergreen broadleaf forests, forest margins on mountain slopes at elevations of 500 - 1000 metres in China[266].

propta Seed - best sown as soon as it is ripe in the autumn in a cold frame. It can take 18 months to germinate. Stored seed generally requires two winters and a summer before it will germinate and should be sown as soon as possible in a cold frame. Scarification, followed by a warm stratification and then a cold stratification may speed up the germination time[78, 80]. The seedlings are rather slow-growing. Pot them up into individual pots when they are large enough to handle and grow them on in light shade in a cold frame for their first year. It is possible to plant them out into a nursery bed in late spring of the following year, but they should not be left here for more than two years since they do not like being transplanted. Alternatively, grow them on in their pots for a second season and then plant them out into their permanent positions in late spring or early summer. Give them a good mulch and some protection for their first winter outdoors. Cuttings of almost ripe wood with a heel, August in a shaded position in a cold frame. Leave for 12 months before potting up. Layering in October. Takes 2 years[78].

nwatta Succeeds in most soils so long as they are not water-logged[200]. This species is not hardy in the colder areas of the country, it tolerates temperatures down to between -5 and -10°c[200]. According to another report, the plant is only hardy to about -3°c[260]. Resents root disturbance, especially as the plants get older[11]. It is best to place the plants into their permanent positions as soon as possible, perhaps giving some winter protection for their first year or two[K]. Plants are very tolerant of pruning and can be cut right back into old wood if required[188]. Dioecious. Male and female plants must be grown if seed is required.

## 8.2.441 Aristolochia serpentaria

Virginia Snakerog

7 tlin 10 cyuc 0 kcak 0 tcan 3 dwat 0.5 m hkuc hmimhtut cyutli kyuctcup hwicli hrasjlutnyik hpa7tli flatpriklwisslip hpa7tmwatli xre7t hionli

drutta Aristolochia serpentaria is a PERENNIAL growing to 0.5~m (1ft 8in) by 0.5~m (1ft 8in). See above for USDA hardiness. It is hardy to UK zone 8. It is in flower from June to August. The species is hermaphrodite (has both male and female organs) and is pollinated by Flies. Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: mildly acid, neutral and basic (mildly alkaline) soils and can grow in very alkaline soils. It can grow in semi-shade (light woodland) or no shade. It prefers dry or moist soil.

pcista We have no specific details for this species but most members of this genus have poisonous roots and stems[179]. The plant contains aristolochic acid, this has received rather mixed reports on its toxicity. According to one report aristolochic acid stimulates white blood cell activity and speeds the healing of wounds, but is also carcinogenic and damaging to the kidneys[254]. Another report says that it is an active antitumour agent but is too toxic for clinical use[218]. Another report says that aristolochic acid has anti-cancer properties and can be used in conjunction with chemotherapy and radiotherapy and that it also increases the cellular immunity and phagocytosis function of the phagocytic cells[176].

dwatta Antidote Antiinflammatory Bitter Diaphoretic Diuretic Expectorant Febrifuge Odontalgic Stimulant Tonic-The Virginia snakeroot is attracting increasing interest for its medicinal virtues and as a result is becoming uncommon in the wild. It merits consideration for cultivation in forest areas[222]. It is used in a number of proprietary medicines for treating skin, circulatory and kidney disorders[238]. The plant contains aristolochic acid which, whilst stimulating white blood cell activity and speeding the healing of wounds, is also carcinogenic and damaging to the kidnevs[254]. The root is harvested in the autumn and dried for later use[238]. The root is antidote, anti-inflammatory, bitter tonic, diaphoretic, diuretic and stimulant[1, 2, 4, 21, 46, 200]. Traditionally it was chewed in minute doses or used as a weak tea to promote sweating, stimulate the appetite and promote expectoration[4, 222]. The native North Americans considered it to have analgesic properties and used an infusion internally to treat rheumatism, pain - but especially
